ing right out here just north of the gas works, they are excavating there I can tell you just what would be done over there. The fottings as they are called, in the ditch that goes around the cellar these footings are pitched in loose in concrete and hammered home.

Q. Is that as close as you can get to answering the question?

A. If you want to make foundation walls you might want to build them of rub-le stone or might want to build of brick or might want ro build of concrete in which case you would have to make what you call forms. That form is a board fence of the cheapest and rudest description.

2395 Q. Does one inch stuff hold concrete very well, usually one inch stuff where you have a heavy concrete wall?

A. In a case of that sort it is a question of your studding and not of your boards.

Q. You spoks of a stick occasionally?

A. Oh no. I am speaking now about going on up. I was speaking formerly of the occasional stick at the bottom of this trench around. Now that is very cheap work and the cost depends upon how often you use these boards and uprights, the studding and bracing that goes with it.

Q. Is that as closely as you can tell us?

A. Oh yes, I can generalize about it.

Q. Did you ever figure what it would cost for forms in a concrete job in your life?

A. Yes, sir.

Q. What job was it?

A. It was a job of building.

Q. Where?

A. It was a job of a building conceived by Thomas A. Edison, the inventor.

Q. Where was it and when?

A. It was when I was located in Philadelphia and when the matter was brought up of building houses and the question of——

—. What year was it, can you tell us what year?

A. All I could tell you it was anterior to the end of 1905 and I know the cost was very great for building complete houses just as I told you that the cost would be very small for foundations.

Q. Did you ever figure it in any other specific case except the one you have mentioned?

A. Not carefully. I would not do it in most cases.

Q. So you can't give us any idea of what would be the

2396 reasonable amount to put in?

A. To a definite statement, yes.

Q. To this specific proposition?

A. That I will work up if you wish it.

Q. I want you to give it basing it on your general knowledge that my friend referred to so often this morning. What would be the proper allowance on account of forms in that $7.00 if you know.

A. Usually for the purpose of foundations 38 cubic yards if you ask me of my general knowledge I will tell you nothing at all for if I had the foundations to put in I would not think of such

a thing as bothering with boards, throw that in loose, have the ditch dug properly and filled.

Q. How high above the ground does the foundation grow?

A. I think four or five feet above the ground, a mere box on the top made out of two inch stuff and moved up after it was put in there. That is the practical way to get at it.

Q. This same foundation would be dug in the ground you referred to this morning as sand, so sandy that the sand would not cost you anything?

A. I didn't say anything of that sort.

Q. Then I misunderstood you when I understood you to say this morning that all over this territory was sand so they could — sand out of the excavation and would not have to buy any?

A. No, I told you sand was very cheap.

Q. You referred to this ground here as sandy ground?

A. This is not the place. This is the part around the edges of the river.

Q. And this building is on the west side of the property isn't it that we are talking about?

A. Well don't you mean the river and not the property?

2397 Q. No it is on the east side of the river and it is on the west of Block C I think is the block?

A. This is close to the river?

Q. Well now then let's go on and see what you know about the next item. There are brick foundations here. How many brick did you take for the foundation?

A. 3,370 brick in the place of 3,990 brick.

Q. Well you knew didn't you that we afterwards corrected that 3,990 to 3,056 so you run about 325 over us or haven't you been advised of that?

A. You have not so advised me. I wondered if you would catch on.

Q. You take 3370 brick?

A. Yes, sir.

Q. Now what price did you put on the brick delivered?

A. $16.00.

Q. On the brick delivered?

A. On the brick laid.

Q. I didn't ask you that, what price do you put on the brick delivered?

A. On the average of what would be about $8.00.

Q. You mean all through the entire job, or all through this building.

A. Be through the entire job.

Q. You put this brick at $8.00 delivered?

A. Yes, $8.00.

Q. $8.00 a thousand?

A. I beg your pardon I assumed they were, that the brick probably cost considerably less, mud brick, but I let it go at that.

Q. Who told you about the price of mud brick, Mr. Dobson?

A. Mr. Dobson. Had a great deal to say about it too.

Q. I know all about it because Mr. Dobson is fortunate
2398 to be an aggressive young man, he is for his side. I am not criticising him for it. Did you ask anybody else about the price of this mud brick?

A. It was said in the presence of the gentleman whose name I am continually forgetting. I think it is Wheeler you said isn't it, the contractor, down here?

Q. He you said was a non-resident?

A. Non-resident, yes impartial in his views I think too.

Q. Who took you down to see him by the way?

A. Mr. Dobson.

Q. This contractor is now working on a job for the city?

A. Yes, sir.

Q. Did you see anybody else?

A. I saw Mr. King who dug up the streets of this town somewhat.

Q. By that you mean George King?

A. I think the name is George.

Q. Used to be a member of the council?

A. Oh, I don't know.

Q. Is he now engaged in any city work?

A. I don't know.

Q. Mr. Dobson also took you to see him?

A. No, I met him through somebody else, I think either the corporation council or city solicitor, one or the other introduced me.

Q. You figure this brick at $16.00 in the wall?

A. Yes, sir.

Q. That gave you what?

A. $53.92.

Q. How much of that $16.00 was labor?

A. Figure it this way, $8.00 for brick, $4.00 for labor in laying a thousand of brick in a common factory style of work or foundation used here, a dollar for lime and sand, $3.00 for a con-
2399 tractor's profit and if a scaffolding appears to be necessary an allowance for a dollar for that and for a pilaster or bridging work across a wall, $1.50 per thousand for that. That will give you the way in which I worked out the brick work.

Q. How much do brick layers get an hour?

A. 70 cents an hour. At least that is what the bricklayer's union claim. I fancy there are a good many contracts below that price.

Q. What makes you fancy that?

A. Just a hint that was dropped to me by the man that gave me the figures that they did not all stick to rates.

Q. So about five hours and a half you have allowed for laying a thousand brick?

A. I have figured very low on the brick work for the class of work that is here, I have put it about 1400 brick a day, a thousand to 1400 brick along about there when I think that a very much larger amount could be and would be done in this common factory and warehouse work which is used in building the gas works.

Q. Now to get back to the question, you figured about five and a half hours for laying a thousand brick, $4.00 at seventy cents an

hour. Five hours would be $3.50, call it five hours and two thirds, for a thousand brick is that right?

A. I figured that a brick layer in this case drawing seventy cents a hour would get where a thousand brick are laid somewhere between $2.50 or $3.00 out of that $4.00 and the balance of that would go to the man that was stirring the mortar and assisting him as a laborer.

Q. Well didn't you figure any closer than somewhere between $2.50 and $3.00?

2400 A. Oh no you can't.

Q. Can't?

A. No.

Q. So on a $2.50 basis your man would lay a thousand brick in between three and four hours. Just about three hours and a half, seventy cents goes into $3.50 three times—four times would be $2.80.

A. About 4.3 or less in about three. Men vary so much in their working that it is absurd to attempt anything less than rough figures on what a brick layer will do.

Q. And the balance goes to the hod carriers and mixers and so on?

A. Yes, people that have to be on hand and helping.

Q. Now what did you figure the back filling?

A. At fifteen cents a cubic yard.

Q. 49 yards?

A. 49 yards, $7.35.

Q. How did you figure the walls, did you figure them separately.

A. Referring to what walls?

Q. Well it is the next item in the inventory in this same building. For instance you take this wall here four inches thick the company takes seven and a half brick per square foot of wall area?

A. I take five and two third brick per square foot of wall area. Thirteen inches thick the company takes twenty and a half brick per square foot of wall area, and I take 18.4, that is about 18 and a half bricks although I knew there were but sixteen bricks in a cubic foot at the time. A seventeen inch wall the company takes 30 bricks to the cubic foot and I have taken 24.1 bricks to the cubic foot again allowing an excess of about two bricks in a cubic foot.

Q. Have you gone through the total number of brick in

2401 these walls, or did you figure the walls separately?

A. We had to figure them one after another and carry them on down.

Q. Have you got this north wall?

A. What page?

Q. Page 19?

A. North wall 13 inches thick 30 feet one inch and 13 feet six inches by 22 and one half brick gives the company's figures 21,319 corrected figures 17,446.

Q. Now at how much did you figure that a thousand?

A. Will you go on down, if you will notice here until you get brick enough you would not want to figure it out in detail.

Q. I want to get the way you figure it.

A. We just corrected your brick figures following them as carefully as we could on down.
Q. You say we. Who helped you do it?
A. Both Mr. Hasek and Mr. Dobson.
Q. Who made the figures as a matter of fact?
A. Who worked these figures out?
Q. Yes.
A. You mean the fundamental figures or details?
Q. Details?
A. The details were elaborated either by Mr. Hasek or Mr. Dobson. And I judge by the figures that these figures were worked out by Mr. Hasek.
Q. What you know about it is what you infer from the figures?
A. How else could I know anything about it?
Q. You might have directed somebody to do it or have seen it, but I infer you did not.
A. Directed them?
Q. Yes.
A. They did it under my sonstant personal supervision.
2402 Q. Then do you know who did it?
A. Mr. Hasek I just told you.
Q. Have you any knowledge of it except from your recognition of the figures?
A. Of his figures?
Q. Yes.
A. I am certain as I can be that I know his figures.
Q. I don't deny that, I didn't ask you that. What is next.
A. Water table four inches thick.
Q. Number of brick?
A. Number of brick is not exactly given for the company but I figure it 180 brick.
Q. What was the next item?
A. Then comes the gable, take the company figures——
Q. I don't care for the company figure, just give me yours.
A. 2,812.
Q. Now the water table?
A. 4,418.
Q. Cornice what did you take?
A. Cornice 407, 232, 272. Pilasters 468, 199.
Q. What did you deduct for openings?
A. 4284.
Q. That is the figure that we have deducted for openings.
A. Yes, that is the figure you have deducted for openings.
Q. Now why didn't you figure deductions on the same basis you figured wall?
A. Because they are relatively very small indeed the brick go up into many thousands.
Q. Are they smaller than the item of 540 brick or 308, or 360?
A. No, but I am talking in aggregate figures now.
2403 Q. So when you come to deduction of the openings you take the company's basis of brick and deduct more than you really thought ought to have been deducted?

A. No, not to make any difference, it is to small a matter.

Q. Well the whole thing is not a very enormous matter is it?

A. No, but where you run up into millions of brick and the openings amount in the total to only about 26,000 it doesn't make very much difference.

Q. Now then on the south wall how many brick did you take?

A. 26,434.

Q. And what did you deduct for openings there?

A. 4,532.

Q. So that we have about 9000 brick there in those two items where you took the company's figures instead of what you claim are the correct figures?

A. Yes, for the reasons stated.

Q. Now then take the east wall, 69,345, what did you take instead of that?

A. 56,710.

Q. Now take the water table, the same item, 734 did you think that worth while to make a deduction?

A. The water table is given by you 734 but it turns out to be 997 bricks.

Q. Yes, I knew that was one we were wrong on.

A. So you have been given credit for the extras right there?

Q. This is 1860?

A. That is 1442.

Q. Take the next one, cornice, 1710, what do you take there?

A. 1294 and 739.

Q. And the next item, pilasters?

2404 A. 1156 and 129.

Q. Now less openings, 9821, was that worth while to figure that?

A. No. Just let it go at that.

Q. The west wall 93111, what did you take?

A. 75067.

Q. Less openings 6960, did you take that?

A. Left that as it is.

Q. Now then walls division B in lieu of 4,546 what did you take?

A. 3434.

Q. And the next instead of 1733?

A. 1309.

Q. And instead of 1530?

A. 1178.

Q. And instead of 563?

A. 456.

Q. And instead of less openings 615?

A. Let me explain about those openings——

Q. First answer my question.

A. Yes, with this explanation that the phrase less openings a certain number of bricks conveys no dimensions, length, breadth or thickness by which you can compute the amount of the openings nor are the drawings large enough to enable you to scale off the openings so that assuming that these people always over estimated the amount of their brick for these openings and to be on the safe

side by allowing them their over estimate I took out more brick than I would have computed for myself, gave it to them and subtracted it at the end here so leaving less openings I have been more generous to the company.

Q. Now I will call your attention to Exhibit 16, building 1, the sketches and ask you to point out a single opening in that
2405 building where the dimensions are not given?

A. This is the building we are talking about isn't it?

Mr BRENNAN: I don't think we ever had that Mr. Guernsey:

Mr. GUERNSEY: You had a blue print of the same thing

A. They have here a very complete drawing, but the openings are not specified less openings does not specify what the openings are. But that is a matter of no consequence because I have allowed you a great deal more opening in brick than you have claimed.

Q. These are deducted aren't they and your generosity to deduct from the total brick isn't it, you understand that don't you.

A. Well you see what I mean——

Q. No answer my question.

A. I have taken the statement here——

Q. You understand this Exhibit 16 don't you?

A. Yes, sir.

Q. You understand that these things you say you have been generous and given more than entitled to are deducted?

A. I have not disputed it.

Q. So the result of giving us your generosity is to make smaller walls relatively?

A. That will make hardly a particle of difference, the amount was so small it does not affect it practically.

Q. You said a few minutes ago these drawings were so small you could not scale the openings?

A. That is true.

Q. It was not necessary to scale them because there it showed the size of them didn't it?

A. No, I didn't say that.

Q. That is the fact isn't it?

A. Not entirely. They don't describe the openings.

2406 Q. Point out an opening where the drawing don't show the size of them. Let's get dow*j* to brass tacks and if there is an opening in that building where the drawing don't show the size of it, where is it?

A. That may be true, but if those shows the openings you have got anothe- things——

Q. You said a moment ago that this Exhibit 16, did not indicate where the openings were, aren't the openings up and down opposite each wall?

A. Some openings.

Q. Such openings in connection with the brick in each wall isn't that it?

A. For instance the walls in division B four inches thick, then it goes on here and speaks of the west wall thirteen inches thick the

same as the east wall and then ends up finally by saying less openings 615 brick.

Q. Oh I beg your pardon, you are not familiar with this.

A. The mere phrase openings don't convey amounts.

Q. Under west wall you have less openings don't you, the second line below the west wall? The same as the east wall then less openings?

A. Yes, sir.

Q. When we get down to division B there is less openings?

A. What are the walls in division B?

Q. If you turn to Exhibit 16 there you will find division B won't you on the sketch or are you familiar with these drawings?

A. I have been over them.

Q. Carefully?

A. As carefully as a man could who is furnished with several hundred drawings and requested to examine them within a week or two.

2407 Q. Have you only given a week or two to the making of this appraisement?

A. I have been busy with this appraisal now for five or six weeks, but in that time I certainly could not give a lot to study of these minute drawings.

Q. Then do you mean to have it inferred you are not familiar with them?

A. I do not.

Q. Are you familiar with them?

A. To a certain extent, yes, sufficient to get a general idea of the buildings.

Q. Now turning to these sketches of building No. 1, can you find there division B.

A. Division B is shown here as the walls surrounding the elevator.

Q. Do you find both a plan of that and a profile and in addition to that some longitudinal sections?

A. I find a plan of the four inch wall, I find a longitudinal section AA showing the foundation of Division B and in addition to that I find the following statement on page 20 of the inventory giving me the amount of brick claimed to be in the four inch walls which go up around the elevator.

Q. Now is it at all difficult for anyone who is familiar with plans to take these sketches and find out the dimensions of the openings in the walls in division B or in any other wall referred to?

A. If you will take a look at this you will find there is shown a window and a door in the elevation there, I presume this omitted, there is the slant of the roof here. I am not able to tell whether there are any side windows in this or not from the side view as a blank wall is presented I presume it is intended there should not be any side windows.

2408 Q. You just pointed to a blank wall here.

A. Yes, sir.

Q. Turn to sketch No. 5, is an elevation given there that shows this outside wall of this division B of this building?

A. There is a sketch given there that shows the east face to the window and door of division B.

Q. Is there a sketch here that shows this looking at it from the north, looking at the whole building?

A. The sketch looking at it from the north is interfered with and not complete because of the oxide elevator, but you find a sketch on the next page sketch No. 4 which gives you a blank wall there showing clearly a blank wall there.

Q. Now then to go back do you mean to say that it is true that you did not correct these deductions because you could not tell from these plans what the size of these openings were?

A. For that reason in some cases, but not as the controlling reason. The controlling reason was the relative smallness of them.

Q. You failed to make the corrections there decreasing the amount of brick which you put into the building don't it?

A. Somewhat, very slightly.

Q. Now what was the total amount of brick you figured in that building here?

A. You refer to building 1, A and B?

Q. The one we have been talking about all the time, page 20, Exhibit 15?

A. You must recall that I have always been giving you 18 brick instead of 16 which is all you are entitled to.

Q. It may be admitted that the witness claims that. I think this is about the fifth time he has volunteered it during his cross-examination and he seems to think we won't appreciate his gen-

2409 erosity?

A. On page 20 the bulk of the brick in this building are given as being 183,167 at $16, per thousand making a total of $2,930.67 but I think there are a few brick later on.

Q. Well let's take the total of this batch here, we will find the others when we get to them. 183,167 was the net after making your deductions?

A. Yes, sir.

Q. What was the gross amount?

A. 209,379.

Q. And the item of deductions which was too insignificant to pay attention to amounted to as much as one eighth of your total didn't it, 209,379 and your deductions 26,212.

A. I took 26,212.

Q. So this insignificant item aggregated one eighth of your aggregate?

A. That would be about 20,000 to take out instead of 26 if we would reduce it by 30 per cent.

Q. So this insignificant -- was about 6000 brick, is that correct?

A. Yes. I may be wrong about that. I will figure it over and bring it in in the morning.

Q. You put this brick in at $16.00?

A. Yes, sir. Scaffolding was in at $1.00.

Q. That $16.00 was made up as you made it up for the foundation?

A. For the foundation brick, yes.
Q. And you made the cost no more for laying the walls and pilasters and things like that than the cost of laying brick in foundations
A. For pilasters I added $1.50 a thousand for the extra trouble of turning corners.
Q. How much did you add on that account in dollars?
2410 A. How much.
Q. Is that in your $2,930.67?
A. Those are bricks.
Q. They -re, look again.
A. $2,930.67.
Q. Are those bricks?
A. Those are brick, common brick at $16.00.
Q. What is the 2,930.67, bricks or dollars?
A. This is for common brick.
Q. What do you add on account of pilasters in dollars?
A. $1.50 a thousand.
Q. How much in dollars?
A. It amounts to $14.65 extra labor.
Q. Did you add anything else there?
A. Scaffolding.
Q. That is a separate item below this brick work?
A. Yes, sir.
Q. You have given us everything on account of that brick work, $2,930.67 and $14.69, I mean brick as far as we have gone?
A. Yes, that is what I think.
Q. If there are any further we will come to that farther along.

Here the further hearing was adjourned until 9:30 a. m. tomorrow.

2411 Thursday Forenoon Session.

AUGUST 17, 1911—at 9:30 a. m.

Counsel for respective parties all present.
Testimony on part of defendants resumed as follows:

WILLIAM D. MARKS, continuing his cross examination, examined by Mr. Guernsey, testified:
Q. Professor, did you bring this New York inventory and appraisement?
A. I did, yes sir. I would say this is very valuable to me; I use it all the time as a matter of comparison, if you will return it to me.
Q. I don't want to deprive you of it. Now this book you handed me is not the inventory you prepared?
A. That is the details of the inventory which I prepared. I brought it down because of the fact that you asked if it was an inventory in detail.
Q. I asked you yesterday whether you made an inventory and whether you had it here and I understood you to say yes to both questions?

A. You are right.

Q. Now where is that inventory?

A. In your hands.

Q. This first page is headed "City's Exhibit 126" and the various columns printed here give Meyer, 1906, actual cost; Meyer depreciation value—who was Meyer?

A. Meyer was an expert from Baltimore, from a maker of apparatus in that city—I cannot recall the name, but he was the selling agent of this apparatus—and he came on and in response to a series of questions orally gave the values as he estimated them of the various pieces of apparatus. He did not furnish anything more than oral evidence and a few exhibits, no completed inventory.

2412 Q. He testified—was he called as a witness by the City or the Company?

A. By the company.

Q. Then these columns here under his head are not any appraisement or inventory made by you?

A. They were picked out from his testimony for the purpose of comparison with my own values.

Q. Take the first number here, Valve House and Vault Under Yard, Date, Inst. or Erect, 1863. Then comes Meyer's Cost and Depreciation value, ground area 395.04, cubical contents superstructure only 5,818.94. Now are there any more details in this inventory with reference to that building, not the cost of it but the structure itself than I have read?

A. None that I recollect; you must recollect this is five years ago.

Q. Will you look at it and see if you can refresh your memory and tell us whether there is anything in this so-called inventory any more in detail than what I have just read—I don't mean the price and values and that sort of thing, but the description of the building itself?

A. My assistant at that time, or assistants—I had eight of them—were——

Q. I don't want to interrupt you, Professor, but the question is whether there is anything further in this inventory any more in detail than I have just read here?

A. Not that I know of in this inventory. There was a good deal before the inventory was reached ——

Q. I know, but I am talking about the inventory and do not care about the other. Now are each of the other buildings re-

2413 ferred to in the inventory described in the same way?

A. Very much.

Q. Does the inventory show any greater detail as to any building covered by it than was shown as I read as to building number 1?

A. I wish that my memory was better, but if there was any greater detail given it was cut down to about the same thing as that for the other buildings.

Q. I am talking about this so-called inventory?

A. It was all on that basis, that inventory.

Q. It does not even show whether the building is brick, stone, concrete, frame or what style?

A. I think it does.

Q. Where?

A. I think the statement is made——

Q. Find it for us then?

A. The statement must have been made early that all of the buildings were brick unless specially specified otherwise. It does not show—is that what you want?

Q. I asked you to point it out if it did—it does not show there, does it?

A. No, it does not show.

Q. Now did you yourself make these measurements—the only thing that appears about the building here is the date of its erection, the ground area, the cubical contents of the superstructure?

A. For those ten gas works?

Q. In this inventory here?

A. No, sir; I did not.

Q. On this first sheet here marked "City's Exhibit 126," was that a comparison of your valuations with those of some other witnesses?

A. If you will allow me I will explain to you what it is.

2414 Q. Please answer the question.

A. In part.

Q. Now that was Exhibit 126. Now you have bound with it "City's Exhibit 126 Continued." Now passing houses, we will take up some of the apparatus. First I notice item number 38 here, four purifiers, 16 feet by 27 feet by 3 feet 6 inches. Date of installation 1863. Is that all the inventory shows about them as to their character?

A. Yes.

Q. Next I note another item here, three meters, 1882 is the date of installation or erection. Nothing else whatever in the way of description of them, is there?

A. If you can't find it there.

Q. I don't find it—of course I am not as familiar with it as you are. Now I notice here item 70, two small boiler pumps; no descriptive matter whatever. Are those things I have been reading to you fairly indicative of the way in which this exhibit that you have been referring to is made up so far as the description of the property is concerned?

A. Yes.

Q. And as to each piece of property there follow columns showing the Meyer valuations and your valuations?

A. Isn't there Rowland valuations in there?

Q. Maybe Rowland as to some of them, actual cost.

A. And isn't there some of Lacombe's valuations there, chief engineer of New York City—in order to be perfectly fair, the chief engineer was asked to go out independently——

Q. We don't care anything about your fairness in that case——

Mr. Byers: It is your fairness——

Q. Did you say in order to make me perfectly fair the

2415 chief engineer was asked to go out independently——

A. That would be the result if you read that carefully.

Q. Do you wish to stand by your answer to that, that in order to make me fair——

CHARTS

TOO LARGE FOR FILMING

A. Allow me to correct this and give independently valuations——

Q. I want to know whether you stand by your answer made to the last question.

(Question repeated.)

A. I don't think it is worth——

Q. Well, pass that; I don't think it amounts to anything. The next thing shown here is "City's Exhibit 127." That was an independent exhibit—these were not bound together in this way when offered in that case?

A. They were offered in typewritten form.

Q. They were not bound together, were they?

A. I cannot recall that. They were offered in typewritten form, large sheets; whether they were bound together I can't recall, that was a matter for the assistants in my office.

Q. Here again, as to buildings you show nothing but the ground area contained and date of installation or erection; that is true, is it not?

A. Yes.

Q. And that work was not done by you yourself?

A. Every building was inspected personally.

(Question repeated.)

A. What work do you refer to particularly?

Q. The work covered by the last question, the work of giving the ground area and cubical contents?

A. I did not compute the cubical contents. If I remember rightly I did compute the ground areas, preferring those as a
2416 check. I am not certain even on that point.

Q. Did you make the measurements?

A. I did not.

Q. And this Exhibit 127 shows apparatus in the same way it is shown in the earlier exhibit as to another station?

A. Yes.

Q. Now next comes Exhibit 128, Forty-Fourth Street, that lists the property as the previous exhibits have as to other stations?

A. It does.

Q. Will you permit the reporter to take this and copy Exhibit 126, Professor Marks?

A Certainly.

Q. Is that Exhibit 126 typical of the other exhibits in this bundle which you call your New York inventory?

A. I should think so; part of it.

Q. This includes separate exhibits up to and including 135, does it not?

A. I think it does.

Mr. GUERNSEY: We will offer this Exhibit 126 to illustrate the character of this so-called inventory in connection with this cross-examination and ask that the reporter copy it into the record.

Said exhibit is as follows:

(Here follows Complainant's Exhibit 39, marked pages 2417, 2418, 2419.)

2420 Q. This valuable document you speak of is a printed record of that case?

A. It is.

Q. And where is the valuation of the New York property?

A. In Wilcox vs. the Consolidated Gas Company, in my early testimony incorporated there as a succession of brief summaries.

Q. Have you here a copy of your Cleveland inventory or the Buffalo inventory?

A. I have, but it is in my room; I can bring it to you.

Q. Will you bring the Buffalo as well?

A. I am not certain I have the Buffalo.

Q. Are you certain you have made one in Buffalo?

A. I think so.

Q. You are confident of that?

A. I am quite confident on that point.

Q. Have you a copy of the Jersey City inventory?

A. No, I haven't.

Q. You didn't make one there?

A. Yes, I reported to the tax commissioners.

Q. Did you make a formal inventory of the property?

A. In Jersey City, to the extent of the capacities, yes and using units.

Q. What do you mean by the extent of the capacities?

A. Unit capacities and average prices per unit.

Q. I am talking about an inventory and list of the property value.

A. An appraisement of Jersey City, including much detail, was not *not* made and could not have been made in the time I had. But appraisement was made on the basis of averages, and the units and such pieces of apparatus as happen to differ from the usual run of gas works.

2421 Q. I want to get back to the question I asked you, whether there was a detailed formal list of the property in Jersey City made?

A. Not by me; there was one handed to me there, just as here, if I remember rightly, but even that I did not use.

Q. What you did down there, as a matter of fact, was to estimate the value of some other plant, not the plant they had there, you didn't estimate or attempt to confine yourself to the apparatus they had there in Jersey City?

A. In addition to the gas works—I did not mention that to you—I estimated the value of the Marion Electric Power House——

Q. I don't care about anything except gas works and the gas works in Jersey City, you did not attempt to estimate the actual plant that was there, but you substituted another plant for it?

A. An equivalent capacity; you may put it that way.

Q. Returning to Exhibit 15, your scaffolding, you say was included in the $16 a thousand for the brick in the walls?

A. No.

Q. How much did you allow from the item of scaffolding?

A. $1.

Q. What was the aggregate of it?
A. $17 a thousand—you mean of the scaffolding itself?
Q. Yes.
A. If I remember rightly $200; just even $200.
Q. Now the next item, roof slate, how many squares did you allow for there on page 21, I see it is given?
A. 33.96 squares. And also the roof on slate on division B 1.66 total 35.6 square-, at $10 a square $356.20.
Q. Now what are the factors that you took into account in getting this $10 a square?
A. Slate and labor.
2422 Q. What else?
A. The quality of slate has a good deal to do with it.
Q. What else besides slate and labor?
A. I don't know that there is anything else in the matter of slating.
Q. How do you attach the slate to the roof?
A. Well, there are a number of ways.
Q. What did you figure on here?
A. Ordinary nails and wood. I did not examine to see what kind of nails they used, I will tell you that right to begin with.
Q. I am interested in having the information, but I haven't inquired about that; I assume though that if you made an intelligent or careful estimate you took into account the fact that the slate was to be attached to the roof, is that true?
A. Yes.
Q. Did you take into account anything for materials?
A. Slate.
Q. In attaching it to the roof?
A. The average number of nails.
Q. Now, then, how much of this $10 was labor? Can you give me this information without referring to a book?
A. I am not an encyclopedia of facts of this sort; I am not a carpenter or roofer; I haven't an infallible memory; anybody knows perfectly well that this sort of thing is never expected of an engineer, that you are talking about.
Q. Will you answer my question. Can you give me the amount of labor that would go into that estimate of $10 a square?
A. Yes.
Q. Without referring to a book?
A. No.
2423 Q. What would the labor that went into that $10 a square be worth per day?
A. I have already stated to you I cannot answer that without a memorandum.
Q. How long is it since you have had something personally to do with the construction of a building that had a slate roof on?
A. Last summer.
Q. Where was it?
A. In New York state.
Q. Where?

A. At my home.
Q. Your residence?
A. No, it is nothing so dignified as that.
Q. What was the building?
A. It was an estimate for slating.
Q. An estimate for slating, where was the building?
A. The building was located in West Port, my home.
Q. Now, aside from that, have you had any experience in connection with slate roofs for the last forty years?
A. Oh, yes.
Q. What was the last one?
A. Do you mean that I did any slating myself?
Q. Aside from that, have you had any experience in connection with slate roofs for the last forty years?
A. The last that amounted to anything was a series of estimates for the roofs of the Inland Empire system going south from Spokane in an electric railway; I do not think they were used or carried out.
Q. I want to know one that was built.
A. I do not recall any. I probably had a lot of them but
2424 I wouldn't pay any attention to it.
Q. Can you tell me the actual cost of any piece of slate roofing that has been done anywhere within the last ten years?
A. I never took the trouble to look up the details. About $10 is considered all right for the common variety of slate.
Q. So that you have neither done any of this work nor do you know the actual cost of any job that has been done within ten years?
A. I am not a slater, consequently can not tell you those facts.
Q. Is it your idea that slaters are the only people who have a practical knowledge with reference to those matters?
A. That is true, unless you have U. G. I. pamphlet sent to you giving you facts and figures.
Q. How did you get that $10?
A. I took it as a standard rate.
Q. Where did you get it, in one of these books?
A. Yes, shall I give it to you?
Q. No.
A. I have a number of rates here.
Q. It is not then predicated upon any actual experience or observation of your own?
A. As a roofer, no.
Q. I didn't put it as a roofer in the question, please answer the question.
A. Yes, it is predicated on my general knowledge of the cost of roofing.
Q. Will you give us the actual experience of your own in constructing or supervising the construction of roofing of this character from which you say you predicate this estimate?
A. As I explained to you, of course there is a very large amount of work that an engineer, a busy one has to do in which he
2425 takes the values in a large way of standard rates. The last case of slating I remember that I prescribed was for the Dur-

ham Coal Gas Retort House in which slate was used for the roof as it is, I think in all retort houses. I think I prescribed lead nails bent around wrought iron purlings and the man in charge of that work got some arrangement by which he used the ordinary sheathing and galvanized wire nails and nailed his slate to the roof; that is as near as I recall it; I recall we had an immense amount of slate roofing under the specifications of William Pharmer in the Laclede gas works and there have been a number of other cases I cannot recall in regard to electric light stations. At one time I was engineer in chief for the old Edison General and looked over the specifications of all their roofs but in every case of that sort, beyond general values I have been obliged, as a busy man, to relegate it to some man specially skilled in the details or some inspector.

Q. So that in this case you simply referred to some book and got the $10 and took the number of squares here and multiplied it?

A. No, it is not the case at all. I happen to recall it was about $10 that most of these stations cost.

Q. Anybody, whether he was an engineer or not, could go to this same book and take this inventory and multiply it out?

A. Just as you did for bricks.

Q. Do you regard a valuation made that way as equally trustworthy with one that is made by a man who has had practical experience and can check these things by his experience?

A. I should certainly not.

Q. Now then, what are these roof supports, the next item?

A. I presume they mean roof trusses.

Q. Don't you know?

2426 A. I thought that meant roof trusses.

Q. Could you intelligently estimate their cost in place without knowing what they were?

A. I looked at them and I thought they meant roof trusses.

Q. Are you satisfied that is right?

A. I so corrected the reading in my mind and assumed they were roof trusses that held the roof up.

Q. What was the 2090 feet board measure roof trusses?

A. I saw it stated in this book and I so accepted it.

Q. Where is it stated in the book?

A. Roof support, 2090 feet board measure, $27 per M.

Q. The $27 is your figure?

A. Yes, sir.

Q. 5061 board measure, what sort of stuff is that, is that roof supports also?

A. It is so stated.

Q. I am asking what it is as a matter of fact?

A. It does not go into details there, it looks like wooden material timber in there.

Q. What was it as a matter of fact?

A. The upper half the 2090 appears from what you stated——

Q. I beg your pardon, will you allow me to distinguish between

the teo; I don't want you to base your answer on what I stated, base it on your own knewledge.

A. I base it on statements furnished to me by the company or by yourself.

Q. What statement have I furnished you with?

A. In regard to the roof support, exhibit 15.

Q. You don't mean that I personally furnished it to you?

A. No, the company did.

2427 Q. Go on and tell us just what that 2090 feet is used for?

A. That is supposed to represent the long timbers, assumed by myself, immediately adjacent to the roof sheathing.

Q. That is the rafters?

A. Yes. And the 5061 feet below is assumed to represent the ordinary length, not the great length, there is a distinction in the prices here, giving an additional $2 per thousand for the long timber.

Q. Let us stick to the question now. 5061 is the ordinary length of these same rafters?

A. Taken as such at $29.

Q. What did you nail your slate to?

A. The Sheathing there.

Q. Where is it—you haven't got anything but rafters.

A. The lower half you have here 5061 is ordinary board measure.

Q. You just told us that was rafters.

A. No, I did not; you told me it was rafters.

Q. Didn't you in response to a question of mine a few moments ago assent to the proposition that was the rafters?

A. I told you this 2090 feet had $2 added to it on account of extra length. You notice the statement is made here that there is extra length here at—per thousand per length over 16 feet; isn't that there?

Q. No.

A. This is what was given me; this is what I go by.

Q. Oh, no; don't the plans show something about this building?

A. Let Mr. Hazard here bring the blue prints. The plans show nothing a man could take quantities from.

Q. Did you hear the testimony of Mr. Randolph who took all his quantities from the plans?

2428 A. I wasn't here most of the time, only at the finish of Mr. Randolph's testimony.

Q. Then you didn't hear his testimony that he accepted the quantities here?

A. No.

Q. What is your conclusion now as to what that 2090 feet was?

A. At the top?

Q. Yes, what it was as a matter of fact.

A. I accepted it, as I told you, examining it, that this was their

long timber nearest to the roof and the balance below is timber used for all other purposes and of ordinary length.

Q. The balance below that is sheathing?

A. Not necessarily; there may be cross pieces in it; there probably are cross pieces in it. I didn't go into the details in this way or I would have been here six months if I had.

Q. What were the 451 pounds of iron?

A. There were a lot of iron rods that you see in these wooden trusses; I took it for granted that was the stuff.

Q. Now what did you estimate this 2090 feet board measure at?

A. $27. plus $2 making $29. common timber. Do you want the amount of it?

Q. Yes.

A. $56.43. That happens to coincide with your own figures, I think, the Company's figures.

Q. Where did you get your $27.

A. From the firm of Queal & Company here who sell lumber.

Q. That then was not based on your own experience but on what somebody told you, isn't that right?

A. As in every case, I have been obliged to learn prices from dealers.

2429 Q. You have not your own experience in the purchase of things like that to help you?

A. Not in Des Moines.

Q. Nor elsewhere as a matter of fact, have you?

A. I have been accustomed to purchasing lumber and other matters in a large way.

Q. Now, then, what did you allow for your 5061 feet B. M.?

A. I allowed a rate of $29 for that board measure, which included nails and that sort of thing.

Q. Did your $29 on the other include nails?

A. Well, there is very few nails in these big timbers you know.

Q. How much of the nails was there in the $29.

A. I have to acknowledge squarely I don't know enough about buying nails, my experience as a nailer is not sufficient to tell you how many were used.

Q. Your experience in building operations is not sufficient to tell us how many nails were used there, is it?

A. No, I should think not, although my experience has been very large in building operations involving nails.

Q. How do you ordinarily figure the cost of such things as that in estimating buildings; do you figure it as a percentage on the day labor or lumber or what?

A. I generally ask the carpenter about how many nails he will need and send around and get it in that kind of work.

Q. That is the way you estimate it?

A. That is the only way you get any practical results.

Q. Did you ever hear of it being the practice among people actually engaged in such work who keep the details of the costs on various jobs so as to get a basis for estimates?

A. Oh, yes.

2430 Q. How do contractors and estimators usually get at these items, such as nails and things like that?

A. They usually allow what they think that particular class of work will require.

Q. Do they base it on the thousand feet of lumber or on the labor?

A. Well in lathing, for instance, they base it on the number of laths, and in sheathing they base it on about so many nails to a board judging about the boards; the way the timber lays has a good deal to do with it.

Q. Tell us what would be the ordinary allowance per thousand feet sheathing for nails?

A. I never made it in that shape. I have almost built a small village with the use of nails, personally belongs to me, so I know a great deal about that sort of thing.

Q. How much would be the allowance for carpenter work for a thousand feet of sheathing?

A. That all depends—from cabinet work——

Q. I am asking about roof sheathing such as we have here?

A. I have allowed you $2 a thousand right along for nailing on the sheathing.

Q. How much for the lumber delivered?

A. About $27.

Q. Do you know whether that is exactly or not?

A. It is only what Queal & Company told me.

Q. Don't you know whether you put that in your estimate or not?

A. Oh, yes.

Q. $27 for lumber, and $2 covered the other items?

A. Yes, sir; all the rest, makes a total of $146.77.

Q. What are your carpenters earning a day, do you remember?

A. No.

Q. All right. That is all I care for. I can look it up just

2431 as well as you can. How much do you allow on account of iron?

A. Three cents.

Q. Three cents a pound in place, that gives you what?

A. $113.53.

Q. Now, then the next item is sheathing 3562 square feet, where did that go?

A. When that blueprint series comes here I may be able to find it for you.

Q. Didn't you check those things up on the plans at all to get some idea what it would cost to do this work?

A. Certainly not.

Q. You just took this list of so much material and asked somebody what it was worth and multiplied it out?

A. No, I went to work and looked it over, located it as well as I could, and by the time I get through with the building I checked

it out by finding out about what its area was and looked at its condition and gave an estimate of it.

Q. While waiting for these blue prints, what would be a fair estimate of the cost of such building as this, per cubic foot, taking the cubical contents down to the lowest floor? Don't figure it from your book cost; tell us whether you know?

Mr. BRENNAN: I submit that the witness may have the privilege of answering in his own way.

Mr. GUERNSEY: All I want to get at is to find out whether the witness has that knowledge.

The MASTER: If you know, say so, and if you don't say so.

A. I have not figured it by the cubic foot.

Q. Please answer the question. Do you know what would
2432 be a fair estimate per cubic foot down to the first floor, not including foundations, of the cost of a building such as this, if so, what is it?

A. I wish you would be a little more clear in your question.

Q. Question repeated.

A. Do you mean I should give you the cubic foot value on that or do you want to know whether I did estimate the cubic foot value?

The MASTER: All he wants to know is whether you know?

A. I don't know for I didn't figure it.

Q. You have no general information on that subject?

A. Certainly not.

Q. That is a very common way to make rough estimates of values for cost?

A. A very misleading way, although a very common way.

Q. Now, then, where was this 3562 square feet of sheathing used?

A. I presume either in the roof or monitor, I don't know which.

Q. What did you estimate that as worth in place?

A. Four cents a square foot, $142.48.

Q. Four cents a square foot?

A. Yes.

Q. Four cents a square foot would be how much a thousand, can you do that in your head?

A. Looks to me like $40.

Q. You got 3562 square feet and you say you estimated it at how much?

A. Four cents a square foot.

Q. But your aggregate?

A. $142.48.

Q. Doesn't it occur to you that three and a half thousand at $40 a thousand would amount to more than that?

A. It makes about $140.

2433 Q. You gave me $40.

A. $40.

Q. It ought to be $140?

A. There are 3562 square feet at $40 a thousand which comes pretty nearly making $142.48.

Q. Now, why did you make that sheathing $40 a thousand and the roof supports only $29 a thousand?

A. There is a lot of hauling around, sawing and nailing and that sort of thing.

Q. Do you mean to say there is a lot of labor or less labor in putting on sheathing than there is in framing and putting in place rafters?

A. Yes, sir; when you use big timbers the amount of labor that you have, gin pole swinging them up don't amount to very much.

Q. Did you figure a gin pole in swinging these things up?

A. I would use one if I was there all the time. I will tell you how to put these roof trusses up.

Q. Let me ask the question. You say it cost more for labor?

A. Per thousand.

Q. How much labor is there in that $40 per thousand?

A. Well, I should judge—I have been pretty liberal there—about ten dollars' worth of labor.

Q. How much did the sheathing cost?

A. Oh, here—you get it down, if you get it down on the Misissippi river where the prices are right——

Q. I mean what figures you took?

A. Anywhere between $27 and $30.

Q. Didn't you figure closer than between $27 and $30?

A. I wouldn't here.

Q. I want to know just what you did to get this specific
2434 $40 to know what you would do?

A. Put it down this way: About $27 for the stuff delivered; about $8 or $10 for labor, call it $8 for labor, and $5 for the nailing and troubles and general margin, and that would give you about $40. I can see at once that this of course can only be a rough estimate.

Q. Didn't you say on your direct examination that this was such a close estimate that you did not need to figure the ordinary percentage for omissions and things like that, justifying your refusal to do it on that ground?

A. No, I said it was such an elaborate list carried to such extremes that there was no necessity of figuring any omissions.

Q. Now what did you figure that sheathing is worth, such ordinary roof sheathing, per thousand, take the lumber itself?

A. Around here, those are the figures. I am simply accepting your local figures. I would not stand for over $22 a thousand for lumber of that quality in the east for a minute.

Q. We are in the wild and woolly west—so let us take the local conditions and will you tell us that ordinary roof sheathing in Des Moines costs as much per thousand as roof joists?

A. I don't know. When you include labor it may cost more.

Q. I am talking about lumber.

A. That $40 includes labor.

Q. I am asking you whether you mean to say that the ordinary roof, the ordinary common lumber that you use for sheathing—if I remember rightly that is what you used for sheathing?

A. If I remember rightly there was one side of that roof was better than the average and was painted.

Q. The painting is here as a separate item.

A. I don't know, I will look and see if you like.

2435 Q. We will get to that. To get back, I want you to state definitely and certainly, if you will, whether you mean to say that the price of sheathing, taking the price of lumber itself delivered, but not in place, is the same per thousand feet as of roof joists in the city of Des Moines?

A. I do not.

Q. Which is the more expensive?

A. You mean plain stuff; what are you talking about—in the lumber yard or in position where it is?

Q. The question stated, delivered, but not in place?

A. Delivered along side and not in place?

Q. Yes.

A. Well, I should think delivered along side but not in place it would come pretty near about the same here in Des Moines, pretty close, one as close as the other, unless you had some very long timbers, I wouldn't make any practical difference.

Q. Why do you put sheathing at $40 and roof support at $24; why didn't you give us the $5 on roof supports?

A. Because I told you I would swing them on a gin pole. I think if I remember rightly—of course I can't recall—you had rather a good quality of sheathing here, something rather fine as compared with barn roof structures we had in some of the other buildings.

Q. You told us a few moments ago that you estimated it at the same price per thousand?

A. Isn't that a rather finer quality of sheathing than is used generally?

Q. I don't know myself; I supposed you were familiar with those things, you are an engineer.

A. I haven't got a cast iron memory.

2436 Q. You still adhere to the proposition that the labor and iron should be greater in the cost of sheathing, roof sheathing in place, than it should be in framing the rafters forming the roof?

A. If it is a finer quality, I think that is a pretty safe thing to say.

Q. Take the situation as it was here?

A. To the best of my memory, in that case.

Q. How would the quality of the sheathing effect the amount of labor necessary to saw it and nail it on and lift it up?

A. It would not affect it except that the men would do finer work; the men work according to the quality of the stuff handed to them. You give them seconds and thirds, common rough lumber and they will shove the boards two or three inches apart. They know a good deal more about it than the engineers. A jack legged carpenter generally knows more about building a roof. If you give them fine stuff they take more time and work hard at it and it costs more to get it up.

Q. Now we get to the roof slate for the monitor. I suppose you figured that in the same way you did the roof slate before, at $10?
A. I see it is $2.20 total.
Q. The next thing, roof supports, for what?
A. I suppose they meant monitor supports. What do they mean by these phrases?
Q. Can you estimate intelligently the cost without knowing what they *they* meant, where and what use was being made of these roof supports?
A. I know they meant so many thousand feet of timber. You have got 892 feet of board measure there, called roof support, which I supposeed meant trusses for the monitor, and I accepted it
2437 as such, there being no other reasonable explanation, and the stuff is short and all sawed up, and there is a good deal of labor in that little work, and so I added rather an extra allowance.

(Question repeated)

A. Well, no, I suppose nobody could, if there was not an inference to be drawn.
Q. At what rate did you estimate these roof supports?
A. At the rate of $27 for the stuff, $10 for the cost and amount of sawing and fitting that comes in.
Q. $37, then?
A. Yes.
Q. What is your total?
A. About $33.
Q. Can't you give it to me exactly?
A. That is exact.
Q. That $10 item in the $37 is labor?
A. Yes; putting in a monitor is one of those troublesome jobs.
Q. You estimate your iron at what?
A. Three cents again.
Q. What is the total?
A. $4.02.
Q. What is it used for?
A. In that case for holding the timbers together.
Q. In what way, be a little more specific?
A. For drawing up the framing.
Q. Does it run horizontally or perpendicular?
A. I don't recall how that iron came in. It is worth about three cents a pound and I let it go at that.
Q. What was that sheathing for?
A. The same old thing.
2438 Q. Who gave you that $40 figure?
A. I worked that our myself.
Q. From $27 as a basis?
A. From what I was told is the price.
Q. You took $27 price of lumber delivered on the job?
A. That was given to me.
Q. What I want to get at is whether you took it or not?
A. I accepted it, although as I told you before, I thought it was an outrage.

Q. You did tell us that, I don't care about that. Your next thing is flashing, 144 square feet; that is for what?

A. I suppose to prevent roof leaks.

Q. You know, don't you, it is to be used where there are angles to cover those angles to prevent leakage?

A. Yes.

Q. At what rate do you figure that?

A. That is worth about——

Q. I asked you what rate you figured it at?

A. Ten cents.

Q. What?

A. Square foot.

Q. And that makes what?

A. $14.40.

Q. Who gave you the figures on that?

A. I think I brought those from some other jobs.

Q. Now your concrete floor, did you figure that on the basis of square feet or square yards?

A. Thirteen cents a square foot has become almost a standard all over the United States for six inch concrete.

Q. And your wood floor you figured at what rate there—
2439 first will you give me the total for your concrete floor?

A. $357.89.

Q. Now your wood floor, what did you figure the lumber at?

A. I figured that a little too high, about three and a half cents a square foot; it should have been about three, about $40.92 total.

Q. I asked you what you put the lumber in at?

A. I said I estimated it per square foot.

Q. You have to get so much a square foot; you don't figure backwards and take so much a square foot, and then ascertain what the lumber costs; you have to take the cost of the various items and divide by the square feet?

A. No, I didn't do that.

Q. Did you take your lumber at $35 a thousand?

A. Yes, in place.

Q. You certainly understood my question?

A. Will you specify; do you mean in the lumber yard; do you mean along side or do you mean it laid in place?

Q. Give it in each way, in the lumber yard, along side, and laid in place.

A. I should say it is about $25 to $27 in the lumber yard; no $25 in the lumber yard; $27 along side; and $35 in the floor would be the way I would put it.

Q. You have this lumber then at $27 delivered?

A. Yes, and $8 added for getting it in place.

Q. What kind of lumber is this, how does it compare with sheathing?

A. Pretty good stuff; that floor, if I remember rightly, as near as I could locate, it was a floor put around the purifiers.

Q. How does it compare with the sheathing?

A. It is better.

2440 Q. You put your sheathing at $27 a thousand delivered, didn't you?

A. Yes.

Q. You ought to put this higher, ough-n't you, if it is better lumber?

A. Perhaps I ought to run a little higher, but by throwing $35 I am on the safe side for you anyhow.

Q. Do you want the court to understand there is more care and labor required in nailing on roof sheathing than there is in putting down flooring?

A. That is a general question. If you look at the flooring around these purifiers you will make up your mind it is about six of one and a half a dozen of the other in case of that house.

Q. Just tell us what there is about that flooring that indicates to you, if I correctly draw the inference from your last answer, that that work was not done well?

A. I didn't say that, I said it was rough work.

Q. Was the work done well?

A. For the purpose, well enough, just as roof sheathing for the purpose seemed to me a little too well.

Q. You allowed us $10 a thousand in addition to the cost of lumber?

A. $8.

Q. You allowed $10 a thousand in addition to the cost of lumber for the work of the roof sheathing, didn't you?

A. I think that was it; I will look it up—yes I think that is right.

Q. In your judgment, should the amount allowed for labor in laying a floor be 20 per cent less than laying the roof sheathing?

A. Well, if you look at that floor, you will agree with me that I am right in saying yes.

Q. As a general proposition, would it be true?

A. That is something I can't answer; nobody can.

Q. Your experience is not broad enough to cover that, is that right?

2441 A. You are exactly right.

Q. Now we will pass to the next thing there, the partition holding the oxide, describe that.

A. There is a hump which runs the length of the building put in concrete, to prevent the water from being squirted on the oxide and from running over the path through from door to door, giving you a dry walking place, about six inches thick and stands up I should judge about a foot.

Q. This says here 99 feet 2 inches by 8 inches?

A. 99 feet in length from end to end.

Q. 9 inches is the height and 8 inches the width?

A. I should say about 8 inches wide and 9 inches high, looks like a curbstone.

Q. And then the other piec-, 22 feet by 2 feet by 8 inches is a cross partition?

A. Running across the building, yes.

Q. That is two feet high and 8 inches wide or thick?

A. Yes.

Q. Now, you estimated that $10 a cubic yard?
A. Because it had a smooth finish on the outside, an attempted smooth finish.
Q. And that amounted in the aggregate to how much?
A. About 3 cubic yards, at $10, $30.
Q. Can you give us the figures by which you arrived at this $10?
A. In the case of 1-3-5 concrete the following are the figures——
Q. I want to limit you to this $10 for this specific piece of work, Professor?
A. I am working up to it.
Q. Let us start with it?
A. I can't work backwards.
2442 Q. Start with this piece of work and leave out your generalities.

Mr. Byers: I submit the witness is answering the question.

A. I have the figures here for concrete——
Q. Can't you answer the question and tell me what figures you used in arriving at your basis of $10 per cubic yard for this piece of work?
A. Yes.
Q. What figures did you use in arriving at that basis?
A. In the case of 1-3-5 concrete the following is the local cost of the materials in a cubic yard: for broken stone $1.75; for sand $1.25; the total of these two $3. For shrinkage $1, total $4. For cement $1.25, total $5.25. For machine labor, mixing 60c., total per cubic yard $5.85. For extra for smoothing or finishing surface in this case about $2. Total $7.85; for profit $2.15, total $10.
Q. Where were those figures made up?
A. Originally?
Q. No, this particular set of figures you just read?
A. Shortly after I came here the last time; I should say about three or four weeks ago.
Q. The set of figures that you have just read was made up at that time?
A. As far as the $5.85 is concerned. I can locate it better by locating the time I met Mr. Dobson and through him got the prices for material here.
Q. Who gave you these figures?
A. Mr. Dobson. Mr. John Wheeler is the man from whom these figures were obtained first and verified again and again.
Q. How many yards of broken stone are there in a cubic yard of concrete—can't you tell without looking at your memorandum?
2443 A. You might say there is a full yard of broken stone in a cubic yard, because the sand and cement fill the interstices.
Q. Have you figured a full yard, can you tell without looking at your memorandum?
A. I have told you there is a full yard practically.
Q. I asked you whether you could tell without looking at that

memorandum, whether you figured a full yard of broken stone for each yard of that concrete?

A. Certainly.

Q. Did you?

A. Practically, and practically not; getting these figures from Mr. John Wheeler——

Q. Can you tell me now while I have your memorandum what part of broken stone you figured in a yard of concrete?

A. I told you then, practically a full yard.

Q. Can you tell me whether it was a full yard or not?

A. A full yard practically so.

Q. What do you mean by the word practically; do you mean to say a full yard, or don't you?

A. I will try and make it clear to you——

Q. Please try and answer my question.

A. I can't answer your questions because they are questions no engineer would put.

Q. Do you know whether in making up your estimate of what a cubic yard of this concrete we are now talking about would cost, in place, you took a full yard of stone as going into a yard of concrete?

A. Very nearly, not always; you shake it down——

Q. Did you shake it down in making this estimate?

A. I did not.

2444 Q. Can you tell me in making up this estimate of $10 for this specific piece of work you took a full cubic yard of broken stone or not?

A. I will tell you, if I made that estimate, which I do not claim, I would take a full yard of broken stone.

Q. Then you didn't make this estimate of $10 as the cost of a yard of concrete in place, referring to the specific concrete you now have under consideration?

A. Not before you reach $5.85 as the actual cost of the average concrete in the bridge out here.

Q. You took then Mr. Wheeler's cost of concrete in the bridge?

A. Every time.

Q. I am glad to know that. You don't know as a matter of fact then whether there is a full yard of broken stone for each yard of concrete in this estimate of $10 or not?

A. I don't know what Mr. Wheeler did, I told you I would take it myself.

Q. I am talking about this particular estimate, I am trying to get at what you did do; you don't know whether in making this estimate which you used there was taken a full cubic yard of stone for each cubic yard of concrete in place?

Mr. Byers: I submit that has been fully answered and gone over.

The Master: I think it is fully answered.

Q. How many yards of sand did you figure in this estimate for each yard of concrete, can you tell without referring to this memorandum?

A. About one third of a cubic yard is what I computed for inter

stices and the sand and cement, in relation of 1 to 3 that are in there.

Q. Well, that don't answer my question directly; how
2445 many cubic yards of sand are there in the estimate?

A. I will figure it out for you.

Q. Can you tell me from your experience approximately how many cubic yards of sand were figured in this particular matter we are talking about for each cubic yard of concrete?

A. I submit this is getting to be absurd; the suggestion of yards of sand in a cubic yard.

The MASTER: Figure it if you can.

A. Assuming the interstices to be one third cubic yard and that the sand and cement would be in the volumetric proportion of one to three, you would have for the sand three-fourths of one-third of a cubic yard or about one-quarter cubic yard; you would have for the cement about one-fourth of a third cubic yard or about one-twelfth.

Q. You figured for each cubic yard your sand at $1.25, as you gave it a moment ago, in each cubic yard of cement?

A. No, Mr. Wheeler did.

Q. That would make the sand, if it takes one-fourth cubic yard, about $5, a cubic yard in Des Moines, wouldn't it?

A. I don't know on what basis Mr. Wheeler figured this.

Q. You do know, don't you, that the computation up to $5.85 carries $1.25 for sand?

A. That is what Mr. Wheeler's aggregate is.

Q. That is what you gave us a few moments ago?

A. No, Mr. Wheeler did.

Q. I want to get at what you did do; you did tell us a few moments ago, you accepted these figures, didn't you?

A. Certainly.

Q. And you did in answer to my question a few moments ago say that you figured in getting at this base price, that he
2446 figured for you, getting at this base price, was $5.25 and $1.25 for sand?

A. I didn't say anything of the sort.

Mr. BYERS: We object to this for the reason that so far as test questions are concerned they have not only approached the limit but have gone clear beyond, and the price fixed by this witness for this item of $10 a cubic yard is exactly the same price shown by complainant's witnesses, and the controversy with the witness now is whether or not he is giving the company more for sand than he ought, and it is wholly a waste of time.

Q. Now, then, will you hand that memorandum to the reporter and let him mark it as an exhibit?

A. No.

Mr. GUERNSEY: I ask that the witness hand this to the reporter to mark it for the purpose of identification.

The MASTER: It can be read into the record.

Q. In whose handwriting is that memorandum in your hand?

A. I had Mr. Hazard go and verify the figures previously given as far as $5.85.

Q. In whose handwriting is that memorandum?

A. That is Mr. Hazard's handwriting. I don't know what he has written on it beyond what I have mentioned; that is the reason why I would prefer not having it considered an authoritative document.

Q. Is it all in the same handwriting?

A. You would have to get the handwriting of an expert on that.

Q. How long has this gentleman, Mr. Hazard, been in your employ?

A. Six or seven weeks.

Q. Is that the extent of his employment by you?

A. Yes.

2447 Q. Are you familiar with his handwriting?

Objected to on part of defendants as being immaterial.

A. Well, no; I should say not.

Q. Have you any judgment as to whether or not this paper is all in one handwriting?

A. I have not even read the whole of it.

Q. Is it, any of it, in your handwriting?

A. None that I know of.

Q. When did you first see it?

A. About when you first asked the question, about ten or fifteen minutes ago, the first time I saw that paper.

Q. Now, then, you have testified that you could not from memory give us the contents of this paper while I had it in my hand. How can you tell if you only saw that ten or fifteen minutes ago that it gives the basis you took for this $10?

A. Because I stated to you before, my recollection was that my first figures ran to about $5.80 or $5.85 and I saw the line of your examination, and I thought the best plan was to get the figures direct from the fountain head; so I sent Mr. Hazard around to find them.

Q. Mr. Hazard went to Mr. Wheeler to get these figures since I cross examined you yesterday?

A. I think he did it last night.

Q. I cross examined you yesterday as to the cost of concrete?

A. Yes, and I said it was $7, I think, I figured it to the company.

Q. In order to verify those figures for to-day, instead of relying on your own knowledge you sent Mr. Hazard to Mr. Wheeler to get a memorandum showing the cost?

A. Yes, sir.

Q. And Mr. Hazard presented you this memorandum?

2448 A. He did.

Mr. GUERNSEY: I would like to read it into the record.

Mr. BYERS: We have no objection.

Mr. GUERNSEY: I will read it into the record and will ask you to state whether I read it correctly, as follows:

"Price of broken stone is $1.35 for X 2250#.

Locally $1.75.
Sand is worth $1.00 Cu. Yd. Locally $1.25.
Cement is worth $1.08 bbl. Locally $1.25.
Mixing by machine is 60¢ cu. yd.
Mixing by hand is $1.25 cu. yd.

$1.75 stone in cu. yd.
$1.25 sand " " "

$3.00
1. additional for shrinkage.

$4.00
1.25 cement in cubic yards.

$5.25
.60 labor machine.

$5.85 price cubic yard.

By hand:

$5.25
$1.25 labor by hand.

$6.45 cubic yard.

In a retaining wall being built in this vicinity of concrete proportion 1-3-5 and where it happens that a running foot measures a cubic yard of concrete with 57 pounds steel reinforcement a foot, and one pile to every ten fet with excavation down to 3 or 3½ feet below the surface of the water, the contract price is 10.23 per running foot."

Q. Now, referring to that memorandum do you think your computation as to the amount of sand in the amount of concrete as one-fourt yard is correct?

A. I know it is for my purpose.

Q. I want to know whether it is as a matter of fact?

2449 A. I don't think it agrees with what Wheeler had there at all.

Q. I want to know whether you think it is correct as a matter of fact?

A. It is probably about the best form of concrete you can get, because it has the most stone in it and just enough to fill it in with sand *a* cement.

Q. Do you think it is correct as a matter of fact?

A. I would make it correct as a matter of fact if I was working with it.

Q. Did you ever do concrete work?

A. I was the first man to do concrete on a large scale in this country. I built concrete work on the largest scale in 1887 and

1888 before this concrete furor that is going on now was ever dreamed of by existing engineers.

Q. You are familiar with concrete work?

A. From the beginning.

Q. Have been for forty years?

A. I won't say forty years; since 1887; I used concrete forty years ago under the specifications of William Farmer.

Q. You use now a 1-3-5 mixture?

A. I do not.

Q. That is what we are talking about?

A. Mr. Wheeler.

Q. What mixture did you take in this concrete we are talking about for this purifying house?

A. Just Wheeler's mixture.

Q. 1-3-5?

A. I don't know whether it is 1-3-5.

Q. So you don't know what mixture you took?

A. In a rough way it is about 1-3-5. I have not seen the
2450 specifications. You can get Mr. Dobson, the engineer in charge, to give you all the details.

Q. Does the cost of concrete depend anything on the mixture?

A. Somewhat.

Q. Is it usual to specify different proportions?

A. They do not often get away from 1-3-5.

Q. Would you have the same proportion of concrete mixture in the building on the corner here as you would have in a foundation for the pavement?

A. Whatever happened to be the cheapest would probably be sand or stone, would probably be predominant in the foundation for the pavement. The cheapest and meanest form is what is put in the foundation for buildings.

Q. That is what you said you figured in this foundation for this same building in your testimony yesterday?

A. Yes.

Q. Now, can you tell us whether in this 1-3-5 mixture which you have referred to, one fourth yard of sand is used to each yard of concrete?

A. It would be if I were mixing it for certain special purposes.

Q. Do you know anything about the ordinary practice?

A. I have practiced for years and years myself.

Q. Then what is the ordinary practice?

A. The ordinary practice I told you was about 1-3-5.

Q. How many yards of sand does that take for each yard of concrete?

A. The 1-3-5 mixture measured in yards, gives nine cubic yards, but there is a shrinkage there, stated by Mr. Wheeler, to be about $1. in $3.; that is, about one-third apparently; so that Mr. Wheeler expects to get about 6 cubic yards of concrete virtually out of nine cubic yards of material, I should judge. You can get all
2451 these figures from my assistant, Mr. Dobson.

Q. I want to get at what you know about it. Let me ask

you this: take your 1-3-5 mixture, one part cement, three parts sand and five of stone, put it in yards, one yard cement, three yards sand and five yards stone; is it the result of your experience if you mix one yard of cement, three yards of sand and five yards of stone you will get six cubic yards of concrete?

A. If I remember rightly, it was nearer seven. I can't tell without referring to my figures, and the specific figures on foundation work I have in New York City now in my office.

Q. You say then it would be six or seven yards?

A. No, I think it is nearer seven yards.

Q. What sort of a job is this Mr. Wheeler bases these figures on; what is the amount of concrete he is mixing?

A. I don't know, except that it is very large.

Q. He is mixing it in large quantities and putting it in *in* large quantities?

A. Yes.

Q. And is doing mixing by machine, is he not?

A. I presume in part; I am not certain on that, possibly the whole and possibly only in part.

Q. Do you know from your experience whether concrete costs more when it is mixed in small quantities put in place in small quantities, like 3-1/3 cubic yard-, than it does making a bridge as large as Mr. Wheeler is making?

A. The $5.85 given by Mr. Wheeler as the cost of concrete appears to me to be machine work.

Q. He says that on his memorandum, don't he?

A. Yes.

Q. Well, now, let us get to the question.

2452 A. The labor would cost probably as much more—60¢ more.

Q. He puts it at $1.25 for labor in hand work?

A. Yes, I see, by hand.

Q. Now, then, to go back to my question, in your judgment does concrete work in large quantities such as Mr. Wheeler is doing on the bridge here, cost as much as concrete work in small quantities such as we are estimating here?

A. Well, the concrete that is dumped in a ditch for a foundation probably costs less than carefully inspected work which Wheeler is bound to do on the bridge, even on a large scale.

Q. They use the same kind of cement?

A. Not always; there are certain natural cements.

Q. Have you used natural cement in this case?

A. No, in this case first class Portland cement.

Q. Let us go back to our question, which was whether in your judgment concrete in large quantities such as Mr. Wheeler is using in this bridge, costs as much in place as concrete in small quantities such as we are estimating here?

A. If of the same quality concrete in large quantities can be produced at a lesser cost for labor.

Q. Is that the only thing where the cost is less?

A. Sometimes buying in larger quantities, cement, sand and stone will give you a concession in the price.

Q. Now if you have taken *taken* for your estimate here Mr. Wheeler's hand mixing your base fixture would have been instead of $5.85 $6.50, wouldn't it?

A. $6.45.

Q. You took labor at 60¢?

A. Machine work at 60¢.

Q. If you deduct that from $1.25 you will have 65¢?

2453 A. Yes.

Q. If you add to that the $5.85 you get $6.50?

A. I think $6.50 would be near enough.

Q. That would bring you up to $8.50; by adding your profit of $2.15?

A. Well, there is a very large margin of profit there anyhow.

Q. When you made your estimate on this particular three cubic yards, how much of anything did you allow us for forms?

A. I will tell you, that the forms in that case would be two boards propped along side of each other——

Q. I understand that. I asked you how much you allowed for them?

A. Will you allow me to finish?

Q. Yes.

A. The forms in this case, for a standing up curb, would be a couple of two inch plank standing up along side of each other and held together and braced so as to keep them steady. These would be moved along as the curb was built after the matter had been rammed, and when the work was done, if the lumber was all worn out the cost for material for the whole business would probably be a dollar or a dollar and a half.

Q. That don't answer my question. I asked you how much you allowed?

A. $1 or $1.50.

Q. Do you know how much?

A. No, because it is in a lump sum here.

Q. It is in $10?

A. No, it is in the total.

Q. What?

A. Of $30.

Q. That is made up of three yards at $10 a yard?

A. About.

Q. Now, then, you take two planks how long?

2454 A. Well, I don't know what your standard lengths is out here. In New York state, the upper end of the state, 13 feet long that would be the length I would like best for a two inch plank for that sort of work.

Q. Then for your 90 feet you would have to start and stop about seven times in that 90 foot partition?

A. Oh, no; it is practically moving a trough on the bottom.

Q. I know, but you have to pour your concrete and you testified

of ramming it, and then you have to let the concrete set before you can move the planks?

A. No, not in this case; this kind of a job, the finishers will follow right along; you wouldn't have any trouble with this at all; you could pick up your planks and go along in a few minutes.

Q. How long does it take concrete to set so that you can remove the forms?

A. Well, where it is rammed in this way, by the time you get done with your ramming it will stick together in a loose sort of a way.

Q. Did you ever see them take the forms away as soon as they got through ramming?

A. Yes.

Q. How long after your concrete is mixed do you have to pour it to get good results?

A. Generally at once.

Q. So you would have to mix a batch and pour it 13 feet and then you would have to ram it and remove the boards, and what would your concrete mixers be doing in the meantime?

A. Standing around.

Q. You have estimated a job that way on the basis of continuous machine work?

2455 A. No, I was giving you $10 instead of seven.

Q. You would have to mix this concrete by wheel barrow fulls wouldn't you, to do it your way?

A. I would try to get it mixed about 13 foot, the length of the boards. While I haven't taken the trouble to figure that up, because of no possibility of being obliged to build the thing.

Q. That would run your labor cost up very materially, double that at least?

A. I wouldn't say that; I know the labor would cost a good $1.25; you are perfectly right in sticking to a $1.25 or something more perhaps. That's the reason I let it go at $10.

Q. Now take the next item, floor supports, what are they?

A. They are given here 26932 feet, board measure.

Q. What were they, joists?

A. Timbers.

Q. Were they joists under the floor, ordinary floor joists?

A. I do not recall whether these are iron or not shown here. They are timber used in the floor, accepted as such, I think all together intended to be joists or supporting beams perhaps, running from iron column to iron column longitudinally. At any rate I accepted it at $27 then the labor put in at $10 giving a total of $37, or about $996.48 for the floor supports in place.

Q. You figured here the labor of putting the floor supports in place, five times what the labor is in framing the roof then?

A. There was something about that—I think they were twisting in and around four purifiers and did it very awkwardly, or had to do it very awkwardly.

Q. Now, your doors, how did you figure these doors?

A. All these doors, the prices for them were gotten by Mr.
2456 Dobson or Mr. Hazard and I think by both, worked out by them. I notice four Batten doors $24, one panel door $16; and 70 plain windows——

Q. We will stick to the doors for a minute. You don't know how they got those figures $24 and $16?

A. Well, I know in a general way, because they talked them over with me.

Q. Well, how was it, don't you remember?

A. I made inquiry of some of the planing mill men and lumber dealers. I remember getting the following figures in regard to doors, a certain three panel door about $12, a sliding door about $18, and there were windows——

Q. We will stick to the doors?

A. Then there was a sliding barn door—Will you allow me to explain.

Q. I have no objection myself, except I don't want to be charged up with this time.

Mr. BYERS: I submit counsel has been badgering this witness long enough.

A. I also found a double hinge front door, $16, and then I put these young men, as these are trivial matters, to go around and look at the doors and the shingles out around there—most of them are rotten anyhow—and then I got the price new from the planing mills and allowed them about the new price and I gave them the batten doors $24 and the panel door at $16. I think they submitted them to me and I said, let it go at that; don't waste any more time at it.

The MASTER: $16 a piece?

A. $16 for one panel door and $24 for four batten doors, and I let it go at that, making a total of about $40 for the five doors.

2457 Q. Now, you stated in the last answer that you gave that most of them are rotten anyway. Please specify just what that referred to?

A. I used the word rotten in rather a slang sense. I mean by that they have that peculiar ancient, antiquated appearance; they appeared to me a little out of line, and rather rough things to begin with.

Q. They appeared to you about normal in view of their age?

A. It looks as though there had been a very large amount of paint put on them.

Q. Did you yourself get those figures you just referred to?

A. The figures I gave you I went out personally—the figures finally used—I think Mr. Dobson more particularly was the man that got them, being locally informed.

Q. Now on the windows, how much did you give us here for $70 windows?

A. Again the windows were looked up by Mr. Dobson and Mr. Hazard and given at $140.

Q. They got these figures as they did on the doors?

A. They got them.
Q. And the box windows, did they attent to that too?
A. Yes.
Q. How much was that amount?
A. $306.
Q. For the five box windows $306, isn't that a little off?
A. There is probably some typographical error there, though I find these gentlemen paid a good deal of attention to it. Finally your list speaks of 510 square feet and five box windows, which would mean your windows must be ten feet wide and ten feet high, in which case if your statements are correct, which of course is an absurdity—the probabilities are that the gentlemen looked
2458 and found the absurdity, but did not correct it here.
Q. You have no personal knowledge about that?
A. No, personal knowledge.
Q. Sills, cut stone, 34 cubic feet; who made the estimate on that?
A. I think Mr. Dobson is responsible for that.
Q. How much is it?
A. $1.50 cubic yard $51.
Q. Now lintels, cut stone?
A. The same thing, $1.50.
Q. Who made the estimate on that?
A. Dobson.
Q. How much did it amount to?
A. Mr. Dobson got the price and Mr. Hazard made the estimate.
Q. That is, Dobson furnished the price and Hazard did the figuring?
A. In this case, yes.
Q. Now, then, you got some iron there, 2555 pounds, what is that used for?
A. Personally, I don't know; it must have been identified for it was introduced as three cents.
Q. Who made the estimate on that?
A. Mr. Hazard, and I furnished the price, three cents.
Q. Furnished it without knowing what the iron was used for?
A. I did at the time; I don't remember now.
Q. How much is the total?
A. $76.65.
Q. Now, painting, who furnished the estimate on that or price?
A. It is difficult to say; both of my assistants were interested in that; it was a matter that bothered them a good deal in finding out.
2458½ Q. Did you furnish a price on it?
A. They worked it out between them. The total is $80.22. Painting brick work and wood work $39.80.
Q. Now, pit for piping, who furnished the figures on that?
A. I furnished the figure $16. and the computations were made by Mr. Hazard $2.88.
Q. What sort of mortar is used there?
A. I never examined it; I presume old fashioned mortar, maybe cement.

Q. Have you made any difference between the ordinary mortar and cement mortar in the estimate?

A. No—just — I made no difference between the hard red stock brick and your mud brick; I have taken an average.

Q. You figured the brick in place in this pit $16 a thousand?

A. Yes.

Q. Did you figure any other item of cost in that pit?

A. Not unless the form of excavation.

Q. Was it or wasn't it?

A. At the beginning of page 18 excavation is given 189 cubic yard-, 35c; if the pit was included in that excavation, of course it is included.

Q. Do you know whether it was or not?

A. I do not.

Q. Was anything else involved in the pit aside from the brick and excavation?

A. There is nothing computed.

Q. Now, the driveway; who got the figures on that?

A. I gave the figures $16. Of course it is vastly too much, because it is a lot of poor brick set on edge.

Q. Who made the figures?

A. They were made by Hazard, $9.39.

2459 Q. And were these poor brick as you stated paving brick?

A. Oh, just common brick, you know.

Q. You referred to them as a lot of poor brick set on edge?

A. Vitrified brick is the paving generally all over your works there is very poor; it is a collection of odds and ends stuck in.

Q. Can you tell us whether those were vitrified brick or not?

A. I do not; but I know $16 is way up.

Q. When you made the statement they were a lot of poor brick you didn't know whether they were vitrified or not?

A. No.

Q. Now, then, this next item here, who made the figures and gave the unit prices on that?

A. The unit price is $27 a thousand and $10 for labor, are my prices.

Q. $37?

A. Yes.

Q. What is your total?

A. One goes at 49c. and the other at 18c.

Q. What is your total?

A. 67c.

Q. For that other item of brick laid on edge?

A. 56 square feet, 12½, $6.95.

Q. Now, how did you compute the stairs?

A. These are the stairs at the north end of this building. I had occasion to walk up them to go on the purifying floor. They were very handsomely painted in red, but if you would run your hand underneath the rails at the time I was there, you will find it all rotted out, and the treads were very much of the same character,

and the price of three treads, 15c. 45c. and 16 treads at 40c. $6.40 computation was made by Mr. Hazard or Mr. Dobson.

2460 Q. What was the total for them?

A. $6.85—not worth anything to amount to anything, they are no good.

At this time an adjournment was taken until 1:30 p. m.

2461 1:30 P. M., THURSDAY, *August* 17, 1911.

WILLIAM D. MARKS being continued on cross-examination by N. T. Guernsey, Esq., testified as follows:

Q. Prof. Marks, do you recognize the photograph, Exhibit 40, as a photograph of this rotten stairway you have just referred to?

A. Yes, and recognize also the clever way in which the rottenness of the bannister has been covered up by paint, also some broken steps where the men are standing, or one broken step I should say.

Q. You can tell from the photograph that the ba*bb*ister has been painted and that that covers up some rottenness there?

A. I did it by personal inspection, by running my hand over.

Q. I was asking about the photograph?

A. I could not tell from the photograph.

Q. Was the bannister painted before or after this dry rot you refer to developed, or do you know?

A. It was I think painted anew immediately after my first visit to the works and a request on my part that I be given pieces of the bannister for use in the court room which was not granted?

Mr. GUERNSEY: We offer this Exhibit 40.

Objected to as not having been properly identified, irrelevant and immaterial.

Q. I suppose at a cost of a dollar or so that bannister could be replaced couldn't it?

A. I have not estimated it. It would not be very much.

Q. Now what did you put these brick steps in at?

A. 189 bricks at $16.00 per thousand, $3.02.

Q. And the platform?

2462 A. 162 feet board measure at $37.00 per thousand, $6.00.

Q. Now will the total of these items that you have given me in connection with this building equal $6,904.92 which you have given as the structural cost?

A. Yes, sir. I beg your pardon, it was not the structural cost, $6,904.92, the structural cost is $7,768.04 being the actual contract price plus 12 and one half per cent.

Q. What do you mean by contract price, the sum of these items which you have estimated?

A. The sum of these items on the assumption that on the average the work that was done by contractor, not necessarily the whole of it.

Q. And what profit did you estimate the contractor has in this $6,904.92?

A. I didn't estimate it in that way. I have tried to give the contractor about $3.00 profit on every thousand of brick and about

$1.25 and $1.50 on every cubic yard of concrete. It seems that perhaps a dollar would be nearer the actual practical facts.

Q. Now passing to the contents of this house you first take the steam hydraulic elevator.

A. What page please?

Q. Page 25 of Exhibit 15.

A. That is page 14 of my report Exhibit 23.

Q. Now you put that in at 500 and depreciate it $450?

A. Yes, sir.

Q. How long since that elevator has been used?

A. I don't know.

Q. Do you know whether it has been used in the last week or two weeks

A. I don't know.

Q. Was there anything to prevent its being used?

2463 A. It was not us-able at the time one of my assistants went out there and asked to see it move?

Q. Do you base that statement on what your assistants told you?

A. I do.

Mr. GUERNSEY: I move to strike out the statement as hearsay.

Q. What is there to prevent its being used?

A. The fact that its place has been filled by a bricket oxide conveyor, which is presumably put in for the purpose of reducing the cost of carrying up oxide.

Q. That would not prevent the use of this steam hydraulic elevator would it?

A. For economical purposes I presume it would.

Q. By that you mean it would be more economic to use the bricket oxide conveyor?

A. Certainly more convenient, yes.

Q. The steam hydraulic elevator is the only duplicate or reserve apparatus for use in the event that this oxide conveyor is either out of repair or for any other reason must be temporarily out of commission isn't it?

A. Yes, but then you know these oxide boxes are only occasionally filled.

Q. And what is the physical condition of this steam hydraulic elevator, good or bad?

A. As it was not necessary I did not examine it closely, it looked as if it had fairly decent use what I saw of it.

Q. And looked as if it could be used any day if it were not that they used the other which was more convenient and more economic?

A. No, it did not to me.

Q. What was in it as it appears there that you observed there that would interfere with its use?

2464 A. The fact that I thought it had been practically abandoned as an active operative business machine caused me to ask my assistant to go out and investigate it.

Q. Take your oxide conveyors, where are these produced?

A. My memory is bad on that subject, there is a firm of three young men in Philadelphia what started all sorts of link belts. I

think they started under the name Link Belt Engineering Company and while I did not examine this closely it looked to me something like their work and I thought that probably it came from there.

Q. Is that the only place where such conveyors are purchaseable, only reasonably convenient place?

A. Well it is one I would naturally turn to for that sort of thing.

Q. What others are there to which you could turn?

A. Be impossible to make the effort of memory. I would find some trad- paper and look it over if I wanted to get away from the Link Belt Engineering Company.

Q. When did you purchase the last one of these conveyors you purchased?

A. Never bought one in my life.

Q. Do you know what one ever sold for?

A. I do not.

Q. Did you ever make one?

A. Never made one.

Q. Eve- use one?

A. You mean the bricket?

Q. Yes.

A. No never used one.

Q. I see you take 5 per cent annual depreciation on these conveyors?

A. Yes, sir.

Q. Where did you get that?

2465 A. From the date of erection given on them— -

Q. That would not give you your annual depreciation would it?

A. On Exhibit 15 on page 25 at the end, one bricket oxide conveyor manufactured by the Link Belt Engineering Company, *n*I had forgotten that, with one five horse power engine installed in 1905—it was just as I guessed it is a link belt outfit.

Q. But my question was how you hit on five per cent annual straight line depreciation?

A. For these?

Q. Yes.

A. Because wherever you have any of these conveyors the practical engineer will tell you that they are peculiarly subject to wear and tear owing to the nature, the grinding nature of the material which they have to handle and five per cent covering as it did a 40 foot frame work leading up above the top of the eaves having this series of buckets, having an engine having the counter shaft, having a *b*belt, if I remember rightly, struck me as being a very moderate rate. It gives about 20 years' life to the thing which is quite a life for any apparatus of that sort.

Q. Now the purifying boxes are what?

A. They are cast iron boxes held up on iron posts, four of them in a row, and they are used for the purpose of allowing the gas to pass through a mixture of iron oxide usually with chips, some thing of that sort to render the mixture somewhat porous.

Q. Why do you pass it through this mixture?

A. On the assumption that the sulp-urated hyd*or*gen which is

disagreeable in its odor will be absorbed by the iron and that the gas in its purified state ready to burn will be passed on to the holders.

Q. Where can these boxes be purchased?

2466 A. Almost anywhere where man build gas works. They are heavy castings cheap on account of their size.

Q. What does one of these boxes weigh?

A. I don't think I have figured it at all, I am sure I did not. I put it at about four thousand dollars apiece.

Q. Who manufactures them?

A. Well there is R. D. Wood & Co. of Philadelphia. Then there is this tremendous gas manufacturing concern in Baltimore, then there is a Pittsburgh concern whose name I cannot recall. Then there is Stacy of Cincinnati, or Louisville, I forget which. Then there is the old firm, I don't know whether in existence or not now in St. Louis—well no trouble anywhere you go you could get anybody to take the job and do it — very low rates because there is a lot of *iforn* in it.

Q. When did you last buy some of them?

A. I think the last one I bought was a little one for North Carolina, I have told you the name of the town.

Q. Durham?

A. Dur'am, North Carolina.

Q. What size was it?

A. I have forgotten it and the price, haven't the faintest recollection of anything except the fact.

Q. Do you know of the price on any of these boxes for which they have actually sold since that time?

A. Since Durham?

Q. Yes.

A. I can't recall at this moment that I do.

Q. You never bought but one in your experience?

A. Oh, yes.

Q. What others have you bought except the one at

2467 Durham?

A. I could hardly say—for instance I think it was Stacy & Co. that did the work in St. Louis, they did a lot of it, taking care of a million cubic feet or more a day out there and I have forgotten as well about the price there.

Q. Been any variation in price in forty years?

A. Very little. That is the odd part of it.

Q. You are confident of that without knowing any prices at which things sold with one exception in the last forty years?

A. Oh I have had occasion on account of estimates to ask prices again and again and have them furnished to me.

Q. What do these center seal valves cost?

A. I didn't figure it at all, I threw it along with the four purifying boxes.

Q. Do you know what would be a fair charge for that?

A. Not without weighing it and putting a price at about three and

a half cents a pound I should say. If I knew the weight I would tell you what the thing cost. Three and a half, perhaps four cents.

Q. What is this 16 inch cast iron pipe, that is the next item?

A. Is a pipe that connects up underneath these purifiers.

Q. You put that in at what?

A. At $2.10 a foot.

Q. That is the same rate you put cast iron mains in the street isn't it?

A. Yes, sir. I allowed for the setting of this up on its piers and making its joints there just as much as I would have allowed for digging a ditch and sticking it under ground in the street.

Q. As a matter of fact that would not come anywhere near covering the cost of it would it or have you had any experience in doing that kind of work?

2468 Q. You think then that cast iron pipe around these boxes could be put in at a lower rate per foot than you could the cast iron pipe in the streets if run a long distance?

A. I am talking about straight pipe, not talking about bends and such things, talking about straight pipe.

Q. I am talking about the pipe that was there, you estimated there.

A. 327 feet of straight pipe.

Q. Where are the bends and the other things estimated?

A. Along with the boxes at $4000.

Q. Do you buy them from the people from whom you get the boxes?

A. Usually the whole thing comes ready to set up, ought to.

Q. You say usually, tell us one case where you know that happened within the last thirty five years?

A. In Durham.

Q. Tell us another one?

A. I think Stacy & Co. sent out to Fostoria the same year. That was ten years ago.

Q. All set up?

A. No it was not set up, it was already to set up. It would not make any difference really though.

Q. Will you please turn to sketch No. 7 in Exhibit No. 16. Does that represent some of this piping?

A. That is it.

Q. Now looking at the connections or specials do you still say that that piping can be put in place at the same price as sixteen inch pipe in the ground?

A. The straight pipe can be.

Q. I am not talking about straight pipe, you didn't separate the straight pipe from the other pipe?

A. Yes, I did, I excepted that.

2469 Q. This is 327 feet you have here?

A. Let it go as straight pipe.

Q. That as a matter of fact includes all of the piping doesn't it?

A. That I don't know. It was put in here by the building and

I just simply let it go at that, accepted it without dispute as they seemed to be very careful and very accurate in their work.

Q. Does the inventory show whether it is straight pipe or whether pipe that was actually there?

A. It reads this way, 327 feet six inches of 16 inch pipe at, and 2 sixteen inch valves at, and I accepted it as straight pipe and I had included probably the bends and center seal in my prices for the purifiers the $4000 estimate.

Q. What did you include then in your—you just included straight pipe in your estimate on the pipe?

A. I regarded it as straight pipe and let it go at that.

Q. You didn't take a practical estimate of what it would actually cost to do this kind of work?

A. Yes, I did.

Q. Where did you do it, what figure?

A. In allowing for all that kind of work for $4000.

Q. How much did you allow for it?

A. $4000 for each one put in.

Q. How much did you allow for doing the work?

A. I lumped it.

Q. Made a running guess at it?

A. No.

Q. What did you base it on?

A. Looked up purifying boxes of about the same capacity and general size elsewhere.

2470 Q. Where? *Q.* Some catalogue?

A. No, appraisement from New York. I don't recall where I got it, it is my opinion let it go at that.

Q. It is some inventory you got in New York you used this morning where you got this information?

A. No, I think not, probably I think I looked there. It was the Cleveland inventory. By the way, did you want me to bring that around?

Q. I believe I asked you for it if you have it here.

A. I will bring it around if you want it.

Q. Where did you get the information in the New York Inventory, get that from somebody's else inventory?

A. If I remember rightly I got it from Tom Rowland's inventory. I knew him very well when he was alive, got figures of most the different sizes there.

Q. When did he die?

A. He died long before 1905.

Q. Is there any difference between purifier boxes set up in Des Moines and one set up in New York?

A. Yes, I suppose there is some.

Q. What is the difference in freight?

A. Well you would not very probably get any purifier box, you would get what you wanted here through some concern in St. Louis, big iron foundry establishment or in Minneapolis or St. Paul, so I could not tell what the difference in amount would be.

Q. Do you know any foundry from which you could buy them in St. Louis or Minneapolis or St. Paul?

A. No, but if I wanted one I would know in about a week.

Q. You would have to find that out before and something about prices before you know what they were worth in Des Moines?

2471 A. No, I would know pretty well about what I ought to get them for.

Q. As a matter of fact as near as you can tell this traces back to some estimates Tom Rowland made in New York or somewhere?

A. No, it traces back, I have been thin-ing since you began talking about it, I think it traces back to Cleveland to an estimate which I made there and in which one of my assistants very carefully computed all the weights.

Q. Was he city engineer there in Cleveland?

A. No, I was trying to think, he was an Englishman, I was trying to think of his name but I can't recall it.

Q. Did his computation include something on account of pipe?

A. He computed everything all through and took a lot of trouble with it.

Q. Out that into the box instead of the cost of the pipe?

A. I think yes, I could only guess about it, my memory is not good. I think those boxes in Cleveland came to about $6000 apiece.

Q. What was the size of them?

A. The boxes in Cleveland?

Q. Yes.

A. Just speaking from memory I think they were about either 25 by 30 or 25 by 25 or 30 by 30, I can't recollect which.

Q. And how deep?

A. They were unusually deep, that is compared with the old fashioned, they were six or seven feet deep and used for oxide and if I remember rightly the oxide was on two trays one above the other.

Q. I see you have depreciated these things about $6.440. These boxes are made of cast iron aren't they?

A. Yes, sir.

Q. The pipes are made of what, cast iron?

A. Cast iron.

2472 Q. Are the boxes worn out?

A. No.

Q. How thick are they?

A. They will not wear out. I should judge, I am only trying to remember to oblige you, it is a matter of no importance, about three quarters of an inch cast iron.

Q. How much is that hoisting apparatus worth that is in there?

A. I will give you how I figure it if you like.

Q. All right.

A. I figured it at $1,500.

Q. Does it appear here on page 14?

A. On page 14.

Q. I mean the apparatus for hoisting the covers of these boxes?

A. Oh that was included along with the boxes.

Q. Well but how much was it?

A. I have not a very distinct recollection of it. It is a very crude piece of apparatus and rolled along on rollers if I remember rightly.

Q. How much is it worth, what did you put it in at?

A. I didn't put — in separately. I as I told you lumped the whole business at $4,000 to the box and I think these boxes were seven feet deep too weren't they?

Q. Yes, that is what your report says, I assume that is correct. So you can't tell us what it would be worth to do this piping, you can't tell us what this hoisting apparatus is wirth and you only have on the purifying boxes a sort of an estimate based on some other man's estimate in some other case?

A. Well I ought to say you know that I supervised the other man's work and that he did the mechanical figuring in the matter.

2473 It was not his estimate, it was mine except as he acted as an adding, subtracting and multiplying machine.

Q. And that is what you took as a basis for your figures here?

A. Yes, exactly.

Q. And what you have there in the Cleveland case which I suppose is what you refer to, am I right?

A. Yes, sir.

Q. Was not the result of any transaction but an estimate you were making there for use in the appraisement where you were to be a witness?

A. Yes, sir.

Q. So that this is not at all based on any actual transaction?

A. Well I didn't try it of course. The books are the best evidence as you know in all of these cases and would be very easy for you to tell me at once and the court too all that is necessary to know about this matter if the books are properly kept.

Q. I presume we could inform you about most everything, but I am trying to get at the information you had.

A. Well the books are the best evidence if properly kept and properly interpreted and are the only evidence, the rest is almost waste of time.

Q. Aside from the books?

A. Almost all through the whole trial has been a waste of time if you have the records.

Q. So you regard your estimates where they are not based on the books as almost a waste of time?

A. Not any more than I do others.

Q. But you regard them in the same way in which you regard others as practically a waste of time is that right?

A. If the books were here and produced it would be a most de-

2474 cided waste of time on my part and the part of everybody else estimating on it to put in an estimate.

Q. Why do you say you regard it as a waste of time, because in your judgment you can't tell what these things are worth without going to the books?

A. Oh I don't mean to quibble about the thing. The books are actual records as anybody knows. An extimater can make an aver-

age if he has had experience but there may be possibly some peculiar circumstance affecting the purchase of each piece of apparatus which would make it differ from the average, might get a series of averages and not be any particular one right, the average be pretty near right and yet be wrong on every detail.

Q. That don't answer my question. Do you mean your estimate is of practically no value if you cannot get hold of the books or what do you mean? Do you mean it is not possible for a man who is an expert and who kno-s this business without the books to determine the value of this property?

A. I certainly do not.

Q. It ought to be possible for a man who knew the business, who knew what this sort of machinery cost and has been buying it and selling it to tell what it was worth without referring to the books ought it not?

A. Not exactly and precisely as he would if he had access to the books.

Q. This was bought seventeen years ago. You have depreciated it 34 per cent haven't you?

A. Yes, sir.

Q. In what respect has it failed to be just as good as it was the day it was bought for the use to which it was put?

A. Do you mean will it purify gas just as well today as the day it was bought?

2475 Q. I want to know whether in any respect this property is not as useful today for the purpose for which it was bought as it was on the day it was bought?

A. It is not as useful today as the day it was bought because it is approaching inadequacy.

Q. Then this depreciation is solely on account of inadequacy?

A. I didn't say so.

Q. Well is that true or not?

A. It is also becoming obsolete as I think that other materials than cast iron will probably be used for purifiers on a vast scale in which case I think will be maybe not very far away.

Q. What other materials are used today?

A. They are building purifiers nowadays out of doors and out of concrete and some of them seem to be doing very well. There is still a dispute which would make an engineer hesitate somewhat before building a concrete purifier but some of them have begun today to build them.

Q. Did you know that the largest purifiers of this kind which were built in New Orleans are now being torn down and abandoned?

A. Of what kind?

Q. The ones you just referred to, concrete.

A. No.

Q. Would that modify your judgment only as to whether this ought to be condemned because probably we will some time use concrete?

A. I would like to know who the engineer or alleged engineer was that put that up before I expressed any opinion.

Q. Now so far as physical condition of these boxes is concerned they are just as good as they ever were?

A. Physical decay is apparently non-existent, I looked them over.

Q. Would there be any trouble in adding another set of
2476 boxes if the capacity of the plant required it?

A. No. But the chances all are that you would have to get at that work there pretty soon putting in more purifying surface, you are close to the edge of it there and if you do go about it you have got to build new buildings there, larger buildings and probably put in larger purifiers and larger surface and you might in my opinion be glad to dispose of these if you could and build the whole thing up on a larger finer scale than you have there.

Q. Is that the basis of your taking off 34 per cent?

A. On which I give it fifty years life, it is the same thing.

Q. Then you take straight line depreciation?

A. Oh yes. Straight line depreciation is purely a commercial matter. I don't say because I put in straight line depreciation for commercial payments that the depreciation that actually occurs in a straight line? It is only a question of getting uniform payment you know.

Q. So to sum this thing up these boxes are just as good physically as they ever were.

A. Yes, sir.

Q. They may be used indefinitely?

A. Yes, sir.

Q. Indefinitely because if additional capacity is required it may be obtained by getting additional boxes without abandoning those.

A. Not very well because they are not deep enough. If you get in new boxes you will probably put in deeper boxes.

Q. These are what you characterize very deep in Cleveland?

A. I mean as compared with the old style.

Q. What depth boxes are being used now, would you recommend here?

A. I have not given the subject any thought at all.

Q. Then are you sure that you would want to put in deeper boxes?

2477 A. I have only a general impression were I paid for taking the trouble to think about your concern I would be likely——

Q. To evolve some thoughts?

A. Suggest deeper boxes.

Q. And you did not know that the eleven foot boxes are now being abandoned?

A. I would attach no importance to it until I knew who the engineer was that was abandoning them.

Q. In other words, you haven't any judgment of your own about it, you would want to know whether the engineer was a man in whom you had confidence and would attach importance to it or not accordingly?

A. No I on the contrary have very decided judgment as regards some of the so called engineers of this country. I have most emphatic opinions on that subject?

Q. I didn't ask you for your judgment of engineers.

A. And that would assist me in deciding whether I would attach any importance at all to any move they might make.

Q. That covers the contents of the building I believe. I don't want to run through all of these things if I can avoid it. Can you tel- us, take the firebrick shed for instance how many brick you gave us credit for there, page 27, Exhibit 15?

A. Page 27, building 1-C?

Q. Yes.

A. Where you have bricks 389 I have brick 315. I don't see anything else.

Q. I see a new item in here, corrugated iron walls. What did you take on that, the unit price?

A. No. 20 corrugated iron?

Q. Yes.

A. 1.2 squares at $7.50 a square.

2478 Q. Where did you get your figures on that?

A. Mr. Hasek and Mr. Dobson went out and interviewed the iron men of this town and got their prices.

Q. And the same thing with regard to the roof, corrugated iron?

A. The same thing with the corrugated iron. I know that they went out and found local prices and local prices in small quantities too.

Q. I see this is brick in cement mortar, did you take the same old price, $16 a thousand?

A. $16.00 a thousand, $5.04.

Q. Who got figures on the roof supports in this building, these young gentlemen?

A. The roof supports?

Q. Yes.

A. There was an old column that would probably have gone to the scrap heap they had used for one corner, cast iron, 1311 pounds, I think it was cast iron I don't know, put in at three cents by my order giving $39.00. Then there was wood there which was taken at $37, labor and wood.

Q. This column held the shed all right?

A. It was a good deal of a column for a thin iron roof, put in there because handy and apparently no use for any other purpose, looked like it anyhow.

Q. Doing the work all right?

A. Oh yes, carry the whole building on top of it.

Q. In any of the buildings did you allow anything for clearing site and staking out?

A. Never.

Q. I notice in this next building here there is cellar excavation, what did you put that at?

2479 A. Kindly give me the page.

Q. Page 30.

A. Excavating foundations 161.28 cubic yards at 35 cents, cellar 945.86 cubic yards at 35 cents. That could probably be done with horse work at about 15 or 20 cents a cubic yard, but trying to be on the safe side I instructed Mr. Hasek who did this to put it in at

35 cents. You can take a horse and scoop and get most of it out at 15.

Q. I may as well refer to it now, this building you have used the so called Summer's method in getting at your depreciation. What account does that take of the actual condition of the building?

A. It takes into account three divisions, good fair and bad. And gives a different ratio of depreciation, percentage of depreciation for each one of these three. It also gives a different percentage of depreciation as the number of years increase. In other words the depreciation does not appear to increase uniformly.

Q. Now take your first proposition and stick to that for a minute. Take the purifier house, did you take this man's rule for good, fair or bad conditions?

A. It is either good or fair.

Q. Can't you tell us which?

A. No, I can get the copy I used if you wish me to bring it here.

Q. That won't tell us which condition you took there?

A. Yes it will give my percentage, 25 per cent in eighteen years for a brick building, then I can tell you what it was

Q. How does Mr. Summers make *yp* this 25*v* per cent for eighteen years?

2480 A. As I understand, and in this I may be at fault, that it is a matter of the judgment of men experienced in taxing and assessing buildings and that sort of thing that he has availed himself of. Mr. Summers himself explains at a great deal of length.

Q. Who is Mr. Summers, what is his business?

A. Mr. Summers is a gentleman who devised a system of taxation in which the land and the buildings are separated and this system of taxation has become the officially recognized system in Cleveland where it first came to my notice and has also been adopted in New York City at least insofar as separating the assessment on the land and on the buildings. It has also been taken up in a number of other places which I can possibly find for you but cannot recall now and I recall now the matter was discussed at great length in Cleveland and it was decided that the Summers' system was official at least the proper system to use in depreciating buildings.

Q. Now to go back again who is Summers and what is his business?

A. He is an expert on taxation and on depreciation.

Q. Is that his profession or avocation?

A. That is his profession and avocation. He goes from city to city superintending all this assessment and taxation.

Q. How long has he been doing this?

A. I never asked but the first I heard of him, the first mention I heard of him was along about 1905 or 1906 along about that time I think. How much earlier he has been at it I don't know.

Q. Do you know whether he has ever had practical experience in buildings or anything which related to buildings?

A. Well I only know—I don't know his life at all, I don't even know the man. I know the approval of his methods by these bodies engaged in taxation.

Q. You don't know the source from which he took his figures?

2481 A. I do not.

Q. Now then these figures of course give a big depreciation in the early years as you said?

A. Well I won't say that, but it is not a regular depreciation going on down.

Q. You say you take off more earlier years than later years relatively?

A. It so appeared to me.

Q. So it would give less valuation in this case, lower than your methods?

A. Will you allow me to bring that pamphlet in for the benefit of the Master?

A. I don't suppose I have any control over your actions and you can take it up and discuss it all you please.

A. I confess frankly while using it my memory is not good for all things and this Summers' method, the figures of it.

Q. Your memory is good for the adoption of this method which will give you lower valuati-ns than ordinary methods give you?

A. You mean lower depreciation?

Q. A bigger depreciation.

A. Why no I think the reverse is true, for instance here eighteen years at two per cent or two and a half per cent would give you from 36 per cent upwards depreciation while Summers give you only 25 per cent.

Q. And still he takes off more in the earlier years as you have told us relatively than he does in the later years.

A. Irregular. He assumes his depreciation to be due to a peculiar physical law which seems to peter out along towards the end.

Q. And the big depreciation comes first?

A. I won't say the big depreciation, the larger depreciation.

2482 Q. So if his larger depreciation is not as much as this two or two and a half per cent, what do you think of the two or two and a half per cent as depreciation if Summers is right?

A. If I knew nothing of Summers' system, if I did not know the respect and credence which it has gained for instance in Cleveland I would be likely to take two per cent annual depreciation being 36 per cent instead of 25.

Q. And take it off two per cent straight line?

A. Straight line, yes.

Q. Not on a sinking fund basis?

A. Oh no.

—. So that your opinion is that Summers is really a little too low?

A. Not a bit. It is that I don't know enough about that particular matter of depreciation to dispute Summers if it meets with public approval although I don't believe the building will live over fifty years.

Q. What is the method adopted by the public service commission in New York?

A. Well I don't think they themselves have established any definite system.

Q. Do you — of any commission which has adopted the Summers' system?

A. I do not.

Q. What is the method adopted by the Wisconsin commission?

A. Of depreciation?

Q. Yes?

A. I was not aware that they have established a regular system. If they had the- undoubtedly find it would not work.

Q. Then you don't know what their method is if they have one?

A. I have read a good many of their papers and have watched their depreciation I have not had from their statements of depreciation anything more than a general idea than they use the
2483 very best judgment of their assistants, their engineers and of the commission themselves and I have felt that they were exceedingly wise in the matter of depreciation because of the fact of not trying to create any hard and fast law, because you can't do it.

Q. Can Mr. Summer do it?

A. I don't think he can. But when he falls below me in depreciation I give you the benefit of it.

Q. How many brick do you charge us up with in this building No. 3?

A. The page if you please.

Q. The total is on page 32.

A. In place of 117,282 bricks you have I have 93,292 bricks and in the place of 6,194 bricks I have 4,682 bricks.

Q. On what page is the 6,194?

A. Page 32 at the bottom.

Q. I don't see it here.

A. There are a great many changes apparently between what you have and what was given me earlier in the year.

Q. Now did you make any deductions there from the 12,306 which is deducted for openings?

A. No.

Q. Uniformly did not do that did you?

A. Well I won't say that, I will say it is true in this case.

Q. Don't remember about that?

A. No.

Q. Now one or two other items in that building I want to ask you about. Did you charge all the brick work at $16.00?

A. $16.00 and scaffolding that was put in.

Q. How many did you add for scaffolding?

A. $1.00 a thousand I think.

2484 Q. Right straight through?

A. If it was put in in your list. I know my instructions were to give a dollar a thousand for scaffolding and let it go at that.

Q. Instructions to whom?
A. Instructions to Mr. Hasek and Mr. Dobson.
Q. Did they make all the figures then?
A. Oh they had to do the computing. One man could not go over this work following 15 or 20 computers engaged in originating it.
Q. What did you add for pilasters and cornice?
A. $1.50 per thousand and my instructions——
Q. Where did you get that figure?
A. My own opinion in regard to the matter that going around the corner that way added about $1.50 per thousand to the cost of adjusting and laying it in factory work.
Q. Anything extra for the gables?
A. That is too general a question, have you got any figures here——
Q. I mean the gables in this building.
A. What page, what number of brick have you got?
Q. There is one on page 32.
A. You have added 2,287 for the gables, I have added 1,870 for the gables in the first case. In the second case it is the same thing, the company 2,287, myself 1,870.
Q. Take the emplacements, page 33, have you added anything extra there?
A. Running down to the emplacements where the company gives 295 I have 236, the company 259, I have 203.
Q. I don't care for tho-e figures, all the way through you have put those all in $16.00 a thousand on that page or do you know what figures the people did take?
A. Referring to page 34.
2485 Q. No, 33.
A. Well you see this is carried over here.
Q. I didn't ask about that, I asked about 33. There is an item of the same kind on page 34 but I didn't ask you about it.
A. I had to look to see what prices I had fixed here. $16.00 per thousand shown on page 34.
Q. The next thing is water table dressed stone. Mr. Dobson gave you these figures?
A. Yes, $1.50.
Q. Window sills, cut stone he gave you the figures there?
A. Yes, sir.
Q. Lintels, he gave you the figures on that?
A. Yes, sir. $1.50 a cubic foot.
Q. Floors two inch of concrete on two inch planks did he give you the figures on that?
A. No. I think they came to be about that and I told them—there was a hitch about that somewhere there, I think it was about seven cents a square foot.
Q. I know, but where did you get the information did they work it out or did you work it out?
A. I think I worked it out in this case.

Q. Any definite recollection about it?

A. Not very much no. There is an immense number of these details that came up.

Q. Then you don't know whether they worked it out or you did?

A. I know that I approved the figure in the end as being about right.

Q. You approved of all of it did you?

A. Yes, as about right. Of course some things would get by me once in awhile as they would get by anybody because it was necessary for me to be busy ... machinery and apparatus sometimes and they were working on this.

2486 Q. When did they begin to work on this, Mr. Dobson and Mr. Hasek?

A. About the time I came here which I think was six or seven weeks ago. I know they haven't had time enough any more than I have had myself.

Q. About the time we began taking testimony here then that they began working on this ?

A. I think it was a little ahead of it, a week or so ahead of it perhaps.

Q. Are your assistants staying at the Chamberlain?

A. One of them was, the other is a resident of the city.

Q. Mr. Dobson you mean was a resident of this city?

A. I presume so, yes.

Q. He is the man you have already referred to as a member of the city engineering department?

A. Former member of the city engineering department, I think a present member.

Q. Is your assistant who came from out of the city, has he been staying at the Chamberlain?

A. Yes, sir.

Q. So you can tell us when he came here by checking up there can't you?

A. Yes, sir. I think I have paid seven weeks' board there, so it must be about seven weeks ago he came here.

Q. Have you been furnished copies of the appraisements made by the witnesses for the complainant?

A. As they came out, the exhibits were all submitted to me.

Q. You were furnished copies of them?

A. Well do you mean furnished——

Q. Were copies made for you from the copies that were furnished to the city?

2487 A. Well if I remember rightly there was a copy of a portion of Mr. Lea's work I don't think any other copy was made.

Q. What part of Mr. Lea's work was that?

A. The early part of it.

Q. Have you that copy with you?

A. No.

Q. Where is it?

A. Ithink it is at the hotel. I don't think I ever bothered with his copy.

Q. Were these copies also furnished to Mr. Dobson and your other assistant?

A. They were laying there on my desk and at their service as they wanted them.

Q. Now when was this work completed by your two assistants?

A. It was completed along about I should say about two weeks ago practically completed. They were picking up a good many things afterwards as they came up, getting them together, but I think the detail of the work was completed about that time.

Q. And when was your report complete?

A. On the 14th of this month if I remember rightly I signed my report. I think you will find the date in Exhibit 23.

Q. And that was the day when this work was finally completed?

A. When the typewriter finished it.

Q. When did the typewriter begin it?

A. Well you have got me.

Q. And what part of your report was furnished by Professor Bemis?

A. I don't think Professor Bemis has ever seen any part or parcel of that report even up to today. I don't know unless he may have picked it up by accident.

Q. You haven't conferred with him about it then?

2488 A. Why yes, I have been very glad indeed to discuss the matter with him and whenever any line of thought came up or any reasoning to avail myself of his ability.

Q. Have you discussed these unit prices with him?

A. Not at all.

Q. Simply been the theoretical part of the report?

A. Not even that so much as the line of thought. The question we will say, took up the question of depreciation for instance, I think it was after a discussion with Professor Bemis that I liked very much indeed what he had to say and I decided to distinguish between depreciation and residual depreciation after all repaurs had been done.

Q. That is a new thing in this case is it?

A. It is to me original.

Q. And what else did he suggest?

A. I don't recollect anything else except this matter of depreciation which is a subject that has always been an argument amongst all people connected with engineering.

Q. I don't think it need be limited to engineering. Well let's get back to this thing. Did Mr. Hasek and Mr. Dobson go and get the prices for this concrete floor in the basement and the floor timbers and this other concrete floor plank and so on through this building?

A. Referring to what building?

Q. The one we were talking about page 34 and 35 of Exhibit at these two pages.

A. Yes, sir.

Q. And then they worked out the amounts?

A. Yes, sir.

Q. And they did the same thing with the roof supports?

2489 A. Yes, sir. I can explain to you that all these unit figures were brought to me working in a room by myself and submitted to me and if they appeared about right after a little discussion with Mr. Dobson and Mr. Hasek or one of them I would approve of them and they would go ahead and make the computations. They were working elsewhere and away from me.

Q. Take the building then as a matter of fact the way these unit prices were arrived at was Mr. Dobson or Mr. Hasek went to work and figured them out and came in and talked it over with you and you said all right and they took them and went ahead and work-out the appraisements?

A. They got unit values and discussed them with me. Then if they were approved and after they were approved they took what had been furnished by the company as quantities except in the matter of brick where the error was too obvious and made up the computation using the company's quantities and the approved units of value whatever they might be that they had found in any way that they could for the locality.

Q. How much experience has Mr. Hasek had in estimating?

A. I understood Mr. Hasek has had considerable experience in estimating and I know that he is capable as a computer.

Q. Is he a graduate of some school of engineering?

A. Well you will have to ask Mr. Hasek I am not very well acquainted with the gentleman's biography.

Q. What is his age?

A. I should judge about 26 or 27.

Q. And what experience has he had with gas works?

A. None whatever I imagine. It is simply as a computer I asked Mr. Hasek's services.

Q. Tell us what unit prices brought to you by Mr. Dobson

2490 or Mr. Hasek you used?

A. That is a very difficult question to answer because it requires an effort of memory. I know I did not always agree with them. I know where Mr. Dobson brought local figures to me I was inclined after finding out the source from which he got them to accept them without change.

Q. I will put the question in another way. Can you give us any unit prices brought to you by Mr. Dobson or Mr. Hasek which did not use?

A. If I remember rightly I insisted on an addition of something like $10 a thousand for the work of handling lumber, that was one change and I think I probably changed more or less all of the smaller units, I don't know.

Q. Can you recall one that you changed?

A. Well yes, this happens to occur to me. Mr. Dobson told me that the iron used for reinforcement over here on this bridge which is rolled iron corrugations in it, cost about two cents or two and a half a pound and I rather insisted that the wrought iron should be

from three to three and a half or even four cents a pound which was used in the works.

Q. Do you recall any other unit prices you took?

Objected to as incompetent and immaterial.

A. All brick work I think in the case of the brick work that I made Mr. Hasek work out the cost of scaffolding and after he had worked it out added $1.00 to the thousand making the cost of the brick work where the scaffolding was used $17.00 a thousand.

Q. I think I also was the one who directed the addition of $1.50 to every thousand brick in this rough factory and warehouse work where pilasters were put in making the cost of the brick work in the pilasters about $18.50 per thousand where scaffolding was
2491 used. I don't know, I had a pretty active hand—of course I was busy all the time with the machinery and Mr. Dobson and Mr. Hasek worked along on the building for me and I grew to have a great deal of confidence in them.

Q. It was your first experience with either one of them wasn't it?

A. Yes, sir.

Q. Now take the apparatus in this building, what did you include under the head of laboratory apparatus, page 16 in your report? Turn to the inventory page 41, and tell us what items were included in that as laboratory apparatus. Before we go to that I want to ask you something else. You have given foundation excavation there $10 then brick and concrete—page 16 of your report brick and concrete 162 cubic yards at $7.00.

A. That is it.

Q. You lumped that by the cubic yard?

A. Yes, sir.

Q. How many cubic yards of brick there did you get?

A. About two and one sixth cubic yards in a thousand of brick or round figures a couple of cubic yards. Yes, I think that is about it. That would give you about $7.00 a cubic yard for brick work which is about in the neighborhood of the same as concrete as this was for the rough laid pitching work of a brick layer pitching brick into a foundation I just called it all concrete and let it go. He can pitch about three thousand bricks in *in* a day if he knows his business.

Q. That would make your brick in the foundation there, how much a thousand?

A. About fifteen or sixteen dollars along about there.

Q. Now how many brick did you tell us you figured to a cubic foot?

A. I think I gave you eighteen.

Q. How many cubic feet are there in a cubic yard?

2492 A. Twenty seven.

Q. That would — just about 500?

A. Yes, sir.

Q. 486?

A. So for a thousand it would be about two and one sixth, along

about there. It is an easy way of getting at it often used by engineers.

Q. Now then tell us what you included in your item laboratory apparatus?

A. I can tell you how I got at it.

Q. No please tell me what items you included, I didn't ask you hot you got at it?

A. On page 41 Goodwin Bar Photometer, American Meter Bar Photometer, Pentain Lamp, *Pentain Lamp,* Carbonic Acid Apparatus, Freezing Coil in box, stop watches, five foot wet meter, Hydrometer, Barometer, Transit, two T-squares, case of test tools, medicine chest, sulpahte test, C Sulphate test, one Orsat test apparatus 1 Still for tar or oil, 2 Double metal records, one 8 inch U *guage,* one 12 inch U *guage,* four 16 inch U *guages,* four 18 inch U *guages.* One steam *guage,* two steam *guages,* five 20 inch U-*guages,* all lumped at $2,000.

Q. Now did you put a price on each one of these things?

A. I did not.

Q. Take these two steam *guages* on page 57, where are they?

A. I didn't look them up, I accepted them.

Q. They appear in the inventory to be installed and operated, are they laboratory apparatus?

A. No part of the general apparatus around the works. Required I suppose a couple of thousand dollars to take care of them, that is what I took them at.

Q. Did you ever buy a Goodwin Bar Photometer?

2493 A. Yes, sir.

Q. When?

A. Franklin Institute I think in 1884 and subsequently for the University of Pennsylvania. I made some thirty thousand observations on one.

Q. I was asking about buying. When was the last one you bought?

A. I think it was along close to 1887. No it was not, I bought a lot for the Edison Company, a very small matter of 500 or a thousand a piece and I didn't pay much attention to them.

Q. Did you ever buy an American Meter Company Bar Photometer?

A. No, I never did. Goodwin was the fellow that got the orders.

Q. Do you know what they sell for?

A. I told you somewhere between 500 and a thousand. He has a short bar—I remember about $650, a long one run up fixed out about $1,000 complete. Then the rest of the stuff I could not tell what it cost no use trying to recall it.

Q. This first bar photometer is a 60 inch i*ns*'t it?

A. Yes, I should say that was in the neighborhood of four or $500.

Q. About how long are the long ones?

A. About a hundred inches.

Q. Now then did you ever buy these lamps, pentain lamps?

A. I don't know whether you would say I bought them or not. The last time I was at Minneapolis I asked the buying of one,

the city paid for it, and the inspector I believe did the ordering, that was a short time ago.

Q. What did it cost?

A. I don't recall, I didn't pay any attention to it, even if I knew I would not recall it, a small matter.

Q. You don't know what they cost do you?

A. Not now no, I could find out if I wanted to.

2494 Q. The C. O. 2 apparatus you don't know what that cost, do you?

A. I will say once and for all I don't know the details of a single item of that $2,000 mentioned, nor would I take the trouble to find it out unless I wanted to buy one of them.

Q. More than that there are no matters which you have bought or which have been bought under your supervision generally are there?

A. Directly the reverse is true.

Q. The next thing I see here is Connolly Automatic Governor. Are you familiar with the price on that?

A. Yes, sir.

Q. Where can they be bought?

A. I have their letters at home, I think it is some where in Indiana. I can bring their letters around if you like giving their prices if I remember rightly.

Q. How many makers are there of this governor?

A. Connolly?

Q. Yes.

A. I don't know. I would write directly to them in Indiana, look up my memoranda if I wanted them.

Q. They are in New York as a matter of fact aren't they?

A. Well that I don't know.

Q. Did you ever buy one?

A. Yes, sir.

Q. When?

A. If I remember rightly the last one I bought for Durham, one for Fostoria. I may not have bought one for Fostoria. I recall paying for it.

Q. Where did you get your price you put on this one that you have in here?

2495 A. I think I got that from Cleveland, I don't know.

Q. From Cleveland?

A. Yes, sir. I know it is an outside price, more than they would charge a good deal.

Q. By saying you got it from Cleveland you mean you took it from the estimate of somebody an estimate of the Cleveland——

A. No from my own work.

Q. Your own work on the Cleveland plant.

A. I think it was Cleveland, might have been Buffalo, I don't recall.

Q. Where did you get the Cleveland or Buffalo?

A. In the usual way by inquiry of the makers.

Q. Did you inventory this stationary washstand and if so under what head?

Mr. Byers: I submit it seems to me in interest of justice if nothing else, and the treasury of the city and of this gas company that this test examination has gone clear to the limit. Here is a gentleman apparently, it is apparent to everybody way past middle age and he has been bully ragged and nagged ever since early this morning upon matters that are not important and upon questions that will not assist this Master in arriving at a final conclusion. We object to it for that reason, if there — any items here of importance that the witness ought to be interrogated about, that is entirely proper, but the idea of badgering an old man for six hours is to me not only cruel, but inhuman.

Q. Did you list this stationary washstand, bath, flush closet and so on?

A. What else?

Q. Just take those three items, that hundred dollar item down here below fixtures?

A. What page?

2496 Q. The same page 16 and 42 in the inventory. I can put it another way, what does toilet fixtures at the bottom of page 16 cover.

A. Covers the water closet in the corner there.

Q. Is that all?

A. That is all that the toilet fixtures covered there. I don't suppose the water closet is worth a hundred dollars. The rest of them are covered if you want to know about it, bath tub and *laboratory* furnishings on the middle of page 17.

Q. The next two items safety blow back and drip pump*t*. You put them together?

A. Yes, sir, about four hundred. The drip pump is nothing.

Q. Nothing?

A. Oh a few dollars that is all.

Q. Are you familiar with the prices of these blow backs, have you bought them?

A. Oh I don't know. No, I don't recall buying what you call a blow back.

Q. Do you know what is being paid for them by people who are buying them?

A. I know about what they look like, make a pretty good figure on them just as I could what a horse is worth by looking at it probably unless there was something unusual about the brute.

Q. Do you know what people are paying for these as a matter of fact.

A. Yes, for that I should say about $400 of that size. I think a weight was given. No, it was not given here, it was given in another case somewhere.

Q. These are not standard articles are they?

A. I didn't understand it to be a standard article.

Q. You don't know what they cost as a matter of fact?

A. Well I should judge that thing was worth about $400.

2497 Q. But do you know what one was ever bought for or sold for?

A. Why certainly not.

Q. Take these exhausters with the connections, have you had any experience in buying those things?

A. Yes, sir.

Q. Where and when? Take this first one, this Green exhauster?

A. I think I have quotations on my desk now giving the prices of it. I will bring it down if you like.

Q. You did *right* then to ask somebody what it cost?

A. I wrote I suppose to the Green concern to find out the price of the Green Exhauster.

Q. Did they give the price f. o. b. Des Moines or f. o. b. New York?

A. If I remember rightly it was f. o. b. New York. At any rate I made a very ample allowance on them.

Q. Sort of a running guess for putting it in place?

Objected to as being improper question, the witness has not given any answer that counsel might infer it was a running guess.

Mr. GUERNSEY: I will withdraw the question.

Q. Did you make a detailed estimate of what it would cost to bring this exhauster here and install it?

A. No, I did not. I added sufficient to it to more than cover in every possible way the furnishing and installation.

Q. Then did you just make a sort of running guess on that what the cost would be?

A. No, I did not.

Q. Did you make any computation to get at it?

A. Yes, made up my mind about what would be more than the possible cost to land it here and land it on its foundation, then I added a lot to that and gave it all to you?

2498 Q. This page here covers quite a number of pieces of apparatus. Do you know the actual price at which any of this apparatus on page 42 is now selling?

A. You refer to the Wilberhham-Green High pressure pusher and that sort of things?

Q. All items on that page?

A. Yes, I can bring you a dozen letters lying on my desk if you wish.

Q. These letters written to you in response to inquiries from you as to prices?

A. I think so. Or might be written to my assistant in New York, I don't know.

Q. Inquiries made up recently for the purpose of getting information to make up this so called appraisement?

A. In the last month or two for the purpose of geting this information.

Q. If that the general plan you have pursued in getting at these prices to write to somebody and ask him what the price would be?

A. How else would you do it if a man manufactured anything, but ask him what he would sell it for?

Q. I should ask him if I hadn't any information on the subject. Has that been the *court* which you have adopted to write to these various manufacturers asking them for prices?

A. Wherever necessary, yes sir. Anything that was necessary to get a square deal I got and just put it down for a fact.

Q. Take this page 42, you wrote to the Wilberham-Green people?

A. My assistant did, I did not.

Q. At your direction?

A. My direction.

Q. And then you wrote to the people that make the roof exhauster?

A. Either he or I did.

2499 Q. How about tar extractor?

A. Well now if I remember rightly he wrote over to Newark and saw the man and the man told him a tar extractor like this was worth about $600 so I gave you about seven or eight hundred on it landed here.

Q. And in place?

A. In place.

Q. Take the Buffalo Duplex Pump, what did you do on that, write to those people?

A. What page?

Q. The same page 42, down near the bottom.

A. You will find on page 17 given to you at $200 which was its price set up.

Q. Did you write the manufacturers and ask them what it was worth?

A. I did not.

Q. You have estimated it yourself?

A. I gave you all that was coming to you in that and more too.

Q. Ever buy one of these pumps.

A. No, I don't think I did. I don't know, so many different kinds of pumps, I have bought a great many pumps.

Q. Take the Warren pump, and vertical pump, did you write either of these people?

A. No, I didn't write either of them.

Q. Use your judgment on them?

A. Used my judgment on them.

Q. Did you make an estimate on piping in this building or did your assistant make it?

A. Piping in building.

Q. Building contents, apparatus just referred to, referring to the bottom of page 42.

A. Referring to the bottom of page 42 and given on my

2500 report on page 17. I made that estimate myself.

Q. You put 16 inch pipe in this building $4.20 as against $2.10 in the purifying house didn't you? I notice below that double rates covering valves, etc.

A. Quite a lot of valves in here, I would not say an immense number. In other words I wanted to allow you thirteen or fourteen hundred dollars for your valves in there.

Q. The valves excepted you put this pipe in then at the same rate you paid for laying pipe in the street?

A. Yes, sir.

COURT: If I understand correctly this $13,750 includes the other figures there?

A. Yes, it is included in the figures above and the sum of these figures above is also about $2,750, the sum of all the figures beginning at 8 inch and going down to 24 inch inclusive, about $750, twice 1375.

Q. Now turn to the apparatus in the next building. I notice Payne Horizontal engine here page 52, 2 Payne horizontal engines for that matter. Are they indicated here for two engines for blowers in your report on page 19?

A. On page 32 you have one Payne Horizontal engine in building 4, A. B. and C haven't you? You also have one Payne Horizontal Engine six by eight, installed 1887 one 1889. They are these things that are in that shed covered with canvas and covered with rust.

Q. I didn't ask you about that, I asked you where they were if they are in your report?

A. Yes, sir; in the report.

2501 Q. Is it the item I called attention to, 2 engines for blowers page 19?

A. They are included in the six foot water gas apparatus in the estimate for that.

Q. Then I was right, it was two engines for blowers page 19 of your report.

A. My report two generators, two carburetters, two heaters, two washers, one scrubber, one condenser, two engines for blowers.

Q. That is the item which we refer to?

A. Yes, sir.

Q. You just lumped these sets?

A. Yes, sir.

Q. Without any particular information as to what they sell for?

A. Well as I happened to be concerned in paying for a set just about like it in Fostoria, Ohio, I consider I have very precise and exact information as to what they sell for.

Q. And that was ten or a dozen years ago?

A. I think it was long since 1900. I don't know when the people that owned the place bought them. I know it has not been very long since I had to go out there to run them.

Q. What does this note mean, annual depreciation water gas set only $461.00? How do you get at that? Bottom of page 19 of your report?

A. Annual depreciation of water gas set, I declare that is where that stenographer got into that again. At any rate it does not mean anything for it is never used afterwards.

Q. You find also on page 21 at the end of section 15 reference to annual depreciation do you not?

A. That too is a memorandum, that is true, but not used afterwards.

Q. The theory was changed while this was in course of construction?

A. Became such a vast number of items if I went on
2502 taking them item by item I would not have been able to complete my work so I changed the method or used the method used on page 80 which simply took three items instead of a very large number.

Q. Here you resort to another method to get the depreciation, you say depreciation by inspection 50 per cent. You took the actual condition as shown by inspection here.

A. What I thought it was, about half worn out.

Q. I am asking about the method?.

A. Yes, sir.

Q. You resort in this case to the actual conditions shown by inspection?

A. As I look at it you know.

Q. In your next building, this boiler house, that was erected in 1902 wasn't it?

A. It so shows, yes.

Q. And there you go back to Summers again and didn't use inspection for your depreciation?

A. Yes, sir.

Q. Boiler house in pretty good condition isn't it?

A. I don't think I use the depreciation b- inspection except on apparatus, I may have used it, I think I used the Summers system wherever I could uniformly on the houses. 17 per cent eight years, that gives it nearly 50 years which is a great deal longer than it could possibly last I think.

Q. Did you know the character of the building, brick and steel one story high foundations concrete and brick, walls of brick in lime mortar? Floors concrete on earth, roof of slate on steel purlins and trusses, do you think a building like that in eight years is seventeen per cent gone as a matter of fact?

A. Well if I had estimated it myself I should have said
2503 about 16 per cent gone, but Summers said 17 per cent. I should have said 16 per cent certainly.

Q. That is based on the present puer cent condition or is that obsolescence and that sort of thing?

A. The place is good for about 50 years and 50 years means two per cent depreciation.

Q. Straight line?

A. Straight line.

Q. You charge off the same rate two per cent and put it into your operating, do you think the same method should be adopted?

A. Charge it into operating expenses?

Q. Yes.

A. Well as you know I have taken it up as residual depreciation.

Q. I know that, but if you are going to charge off two per cent straight line depreciation don't you think if you follow the plan why shouldn't you continue it afterwards?

A. You mean later on?

Q. Yes.

A. Of course you ought to until the thing runs out.

Q. So that you would have on your method of charging off depreciation here you would have at the expiration of the life of the plant or any part of it a hundred per cent of what that part of the plant cost plus interest earned during the meantime?

A. No.

Q. That is you hadn't used your depreciation fund?

A. That would not be the way I would handle it at all. First of all I would like to charge off if I were allowed to do so by the board of directors the residual depreciation at the end of each year after making every repair I could make, charge off residual depreciation and just make a charge to profit and loss a deduc-
2504 tion or credit to the depreciative investment, whatever it might be, buildings, machinery or anything of that sort cutting down its value. I would then like to make extensions of plant out of that charge, depreciation of building being put into the plant if it was a good plant that you would earn more profit in that way than you could by investment and besides that you would have a surplus which would take the place of your depreciation fund if that were invested outside and as a consequence the value of your plant would be kept up. Your plant would not depreciate in value if your capitalization held even you would go right along and at the end of the term you would have say a million dollars in stock and a million dollar plant which you started out with, that is my idea. In the meantime you would be earning a lot of money and making dividends and nobody would be hurt.

Q. You would charge off for depreciation——

A. Residual depreciation.

Q. On a 2 per cent basis here estimating this building in your fifty year life 100 per cent of the value or cost of the building without taking into account interest?

A. Yes, and in the meantime I would keep the building in the best possible repair if I could.

Q. And in the same way with reference to each piece of apparatus during its life on the theory with which you have estimated depreciation in getting at your valuation here you would charge against that piece of apparatus or that piece of property 100 per cent of its cost without taking into account interest.

A. And at the same time, you follow me do you not, I put it back into plant.

Q. I am not asking you about that. You have got one
2505 idea in your mind and I have another. I — interested in mine.

A. Well I would not agree with you at all.

Q. Let me put the question again. On your theory on which you have charged depreciation here, you will charge against each piece of property during its life as depreciation its entire cost without taking into account interest?

A. Yes, but I would not do that unless I put that amount right back into the works and kept the works up.

Q. Does the amount that you have charged off on account of depreciа- depend upon what you do with the money after you make the charge?

A. As a practical matter it is very important. If you undertake any of these winking fund schemes you wo-ld find yourself with a trust fund you could not touch and a broken down works in a mighty short time.

Q. Now I notice in several of these buildings including this one you have figured the cost there as to the square foot or cubic foot. Did you make the figures or did somebody else?

A. That is you mean the area?

Q. You have given the area 2831 square feet, structural cost per square foot $1.958.

A. What page?

Q. 21.

A. I think these figures for section 16, boiler and engine room Buildings 6 A and B $1.958 per square foot were made by Mr. Dobson, I see his handwriting. I should say to you that the checking out of the structural cost per square foot was for the purpose of assuring myself that there was no abnormal results or values obtained. Costs about $2.00 a square foot and about right for a one story building like that.

Q. What would be about right per square foot in the purifying house?

2506 A. I could tell by looking at it.

Q. You said these figures were about right, I assumed that you have some judgment as to what was about right, if it is simply referring to the record I don't care for it.

A. You are always asking me for an effort of memory, which I don't see has anything to do with engineering or judgment either.

Q. Passing that I will withdraw that question. Now I want to call your attention to page 22 of your report referring to the boiler house extension. That building is brick and steel, one story, ıoundation concrete and brick in cement mortar, the north and east walls, brick and cement mortar, east wall structura- steel covered with corrugated iron, floor or brick cement grouted, roof corrugated iron with steel purlins and trusses one year old. What depreciation does Mr. Summers charge for a building like that?

A. In my report on page 22 near the top of the page there depreciation three per cent, one year, Summers, $30.14.

Q. So that on a building like that this theory you have adopted charges three per cent depreciation the first year.

A. That is it.

Q. And does that refresh your recollection so that you can say whether Mr. Summers begin- with a high rate of depreciation?

A. It does not. May I bring that book in if you would like to look it over.

Q. I said before I have no objections and no control over you.

A. Well I can't recall.

Q. Now turning to the next building you find that for four years Summers has given only 8 per cent don't you?

A. That is so.

Q. Are you still unable to recall enough to tell us wh-th-
2507 his metho- of depreciation results in a lower valuation than the ordinary method would?

A. I am not able as some are to generalize from two instances.

Q. Can you answer the question?

A. I cannot.

Q. Now take this boiler house extension where it is a new building brick in cement mortar and all that did you allow us any more for that construction than on these old buildings for brick work?

A. What page?

Q. Page 21 of your report it begins.

A. Section 16 boiler and engine rooms buildings 6 A and B.

Q. Boiler house extension is the one I had in mind, inventory page 68, building 6-C the last paragraph page 21 of your report, erected 1909, brick and steel construction?

A. I took for all brick work $16.00 plus $1.00 for scaffolding a thousand, plus $1.50 for pilasters making no difference, it was an average all through. I did so here.

Q. On the next building there is something I don't understand, page 74 of the inventory, page 22 of your report, you begin contract price as per company's inventory, $8,449.78. What does that mean?

A. Generator house?

Q. What I don't understand is this contract price as per company's inventory, what does that mean?

A. That assumption was made—it was worked up in detail and the assumption made that a building of that importance would be let to a contractor and that contractor must have his cash before the general expenses in the way of o-erhead charges come in.

Q. How did you get $8,449.78. Our inventory don't show any contract price?

2508 A. Where?

Q. This says contract price as per company's inventory, that is what I don't understand.

A. I will look up the way in which we got that.

Q. Do you know how it was obtained?

A. Oh yes, it was worked out in the ordinary way.

Q. How did you ordinarily work it out, from the company's inventory if the inventory don't give the price?

A. That contract price of $8,449.78 given there is the result of working it out just as the other houses were worked out and had in it cast iron floor which went under the generator making 11,718 which I directed should be subtracted from it leaving a corrected contract price of $6,731.56 the assumption being that the whole building would naturally be given to a contractor it being of that

size and in working it out as I have subsequently learned it was worked out under a sort of inside special arrangement by which the company furnished part and the contractor another part of the work.

Q. Then the words "As per company's inventory" don't refer to prices shown by the inventory, but the building as shown in the inventory.

A. The building as shown by the inventory

Q. You deducted cost of cast iron floors, stairs, etc., for generato-r, what does "and so forth" cover?

A. I was looking back for each of these details and I don't see how I can tell without checking for them and I don't see how we can check without knowing.

Q. Can you look that up this evening and let me know?

A. I will look it up for you.

Here the further hearing was adjourned until 9:30 a. m. tomorrow.

2509 Friday Forenoon Session.

AUGUST 18, 1911, at 9:30 a. m.

Counsel for the respective parties all present.

Testimony on part of defendants resumed as follows:

WILLIAM D. MARKS, continuing his cross-examination, examined by Mr. Guernsey, testified.

Q. Digressing for a minute, Professor Marks, I notice on page 24 of your report that in the fourth line you take from Somers 31 per cent depreciation for 14 years, and in the—I can't give you the number of the line—but about a third from the bottom you take 23 per cent for only 9 years. Do these percentages indicate fairly the way he piles percentages for depreciation for the early years?

A. On page 24, depreciation 14 years 31 per cent, Somers, is the depreciation of a frame building in fair condition at the end of 14 years as given by Somers. On page 24, depreciation 9 years, 23 per cent, Somers, is the depreciation of a frame building in fair condition for the period of 9 years. I can give you the depreciation for each year in the frame building, if you like, running down the list.

The MASTER: You didn't say what the per cent was.

A. 23 per cent.

Q. Well, now, for the first nine years then Somers takes off 23 per cent?

A. Yes.

Q. And for the next five years he takes off 8 per cent?

A. Yes, additional 8 per cent.

Mr. BRENNAN:

Q. Professor Marks, is there any difference in the buildings upon which the depreciation is computed; that is, the character
2510 of the buildings?

A. No they are both frame buildings, and the only differ-

ence in the buildings is the difference of age; they are both assumed to be in fair condition. I would say that according to the system of Somers that for 9 years a good condition is a depreciation of 20 per cent, a fair condition is a depreciation of 23 per cent and bad condition is a depreciation of 42 per cent; and for 14 years good condition is 28 per cent depreciation, fair condition 31 per cent, bad condition is 53 per cent.

Q. Now these are not both frame buildings, are they?

A. The coke shed building, 8-A, consists of a foundation under the ground, and cellar under the ground, as I recall it, excavated to a depth of 8 feet below the ground level; above it it has timber spaced so that it looks somewhat like open work, and it would be difficult to say—if you wanted to you might say a frame building and a brick cellar. At any rate, I took it as a frame building and let it go at that.

Q. I asked you whether these were both frame buildings?

A. Yes.

Q. Well, take the other building, you will find it frame construction on steel, wood braces, walls corrugated iron and corrugated iron roof—now what per cent of depreciation does Somers give for a building like that?

A. Somers gives depreciation for only two types of building, one is a brick building and the other a frame building.

Q. So that he does not give any depreciation for a building of the construction I have just mentioned?

A. Not going into details that way—it is not necessary.

Q. Now let us turn back a little—now take this first building A-B, you- page 13, section 7. You take Somers there for what con-
2511 dition and what kind of a building?

A. Somers' depreciation is used on page 13 for the purifying house in good condition, 18 years, 25 per cent.

Q. Now what does he give for the brick building with steel roof?

A. He does not specify about the roof.

Q. Well, wouldn't there be a decided difference in the amount of depreciation in 18 years between a steel roof, a tar roof or a tin roof or shingle roof?

A. That would depend, if it is a question of residual depreciation, I presume, on the amount of care given to the roof and the way in which it is kept up. At any rate, in this case, the purifying house was put in the highest class, the good; there are three classes, good, fair and bad.

Q. And it was classified as an ordinary brick building?

A. From the table for the depreciation of buildings, store buildings, dwellings, brick.

Q. Yes, now is it your idea that the depreciation on a building such as this which has practically no finish, no plaster, has it—nothing of that kind—would be as rapid as the depreciation on a dwelling, take a dwelling with a shingle roof?

A. The action of the gases, I should say depreciation would be greater because of the action of the gases which are continually more or less in the atmosphere of that room and floating up and attacking

the roof and perhaps even having some effect on the mortar in the walls.

Q. And is that the reason why there is a monitor on this building with an air space there to ventilate it and let the gas out?

A. No that is to avoid, by having the ventilation as good as they can possibly have it, the possibility of an explosion more than anything else.

2512 Q. Now, it is obvious though that this building does not come within the class of buildings that Somers had in mind when he said store buildings, dwellings—and what else did he say there?

A. Table for the depreciation of buildings, store buildings and dwellings, brick.

Q. Yes, and it is neither store building nor dwelling and it lacks many characteristics of each of them?

A. No, I should judge it was, if anything, rather good as compared with what the same type the old type of store in this town and I was inclined to place it in good condition in the classification.

Q. Isn't this the building that had this old brick in it, and things like that, the rotten stairway and other things you talked about, and the floor you said we hadn't seen, that if we had seen it we might think different?

A. The way it was put together——

Q. Yes, the building you made all this reference to?

A. As far as the rotten brick is concerned——

Q. Can't you answer the question directly?

A. No——

Q. Why can't you answer directly whether or not this is the building to which you made this reference?

A. Because you put two or three statements in one question.

Q. I asked you whether these statements were not made with reference to this building. Can't you tell me whether each one of these statements was not made with reference to that building?

A. Let me make each statement separately——

Q. Can't you tell me whether each one of these statements wasn't made with reference to this building?

A. I answer that no.

2513 Q. That is all I care to ask you about then. Now, then, the ordinary store building is how many stories?

A. I couldn't answer that.

Q. At least two, isn't it—you wouldn't say that was intended to apply generally to one story buildings that Somers has there?

A. Apply to buildings of average height, I should judge.

Q. The ordinary store building is plastered, isn't it?

A. Depends entirely on whether it is a warehouse or high class store building; warehouse wouldn't be plastered; this comes in in the warehouse class.

Q. Do you assume that warehouse, or rather store buildings include warehouses?

A. I assume in this case, they are practically in this same class.

Q. The ordinary dwelling has several stories in it?

A. Yes.

Q. Both store buildings and dwellings have large items of expense in the way of finish and fixtures and things of that kind?

A. Not the store buildings.

Q. Now let us take up the next one and see what sort of a building that was—this building #1-C 9: brick foundation, corrugated iron walls and roof, steel braces, dirt floor; what did you take as the classification of Somers to apply to that?

A. That is the building I have given the present value of $82.09.

Q. What classification of Somers did you take to apply to this building—that is what I asked you?

A. I did not take the trouble; it is a lean-to against the wall of the purifying house.

Q. Now take the next building in section 10; how did you classify that?

A. Store building, brick, in bad condition?

Q. Yes.

A. 63 per cent.

2514 Q. Does the ordinary store building have a slate roof?

A. That is a generalization I could not answer.

Q. You never observed enough to tell us?

A. Oh, it is too broad altogether, it would be absurd for anybody to answer——

Q. I don't care about anybody, I want to know whether you noticed it. Now take the next building, section 12 here, did you classify that—this is the building to which you referred, the roof of which you referred to as a sieve, isn't it?

A. That building has a depreciation according to Somers of 63 per cent, as you will notice.

Q. What did you take as the depreciation?

A. I looked the building over and thought that in putting it at 67, about two-thirds of its value gone, that I was dealing very liberally with that building.

Q. So that where Somers run over you inspected it?

A. Such an outrageous case as that where the roof was like a sieve, part of it gone, it was a question whether to give it any value at all or not.

Q. Now, then, Somers you say gives it 63—how did you classify it, in what class of buildings, stores and residences?

A. Brick store.

Q. Do you think that is a proper way of classifying it for the purpose of ascertaining the depreciation?

A. It was the most liberal thing I could do; it ought not to be classified at all; Somers assumes there was a roof at least on the building; in this case there wasn't.

Q. And you think a building with brick floors, dirt floor and operating floor of cast iron plates, with no plastering, nothing of that kind, and with what roof it has corrugated iron on steel

2515 pipes comes within the classification of ordinary brick stores or residences?

A. I do not. It falls far below it.

Q. A building of that character would depreciate in your judgment more rapidly than an ordinary residence or store?

A. It was long past the period of depreciation.

Q. I didn't ask you that. A building of that class would depreciate more readily than an ordinary brick residence or store?

A. Why, yes.

Q. How did you classify the coal shed in section 14 of your report?

A. Store building, brick, depreciation fair, 34 years, 38 per cent.

Q. You said depreciation fair, you meant condition fair?

A. Well, you might put it that way.

Q. That is what you meant?

A. Fair condition, yes.

Q. And then this you classification notwithstanding the fact that it has a corrugated iron roof, on part of it tin, and a brick floor, a part of it, with an ordinary dwelling house, with an ordinary brick dwelling house or brick store for depreciation purposes?

A. I noticed the north wall of that had fallen down recently and was replaced by a new wall, and I put it in a good, fair condition.

Q. Did you notice this wall fall down?

A. I wasn't present.

Q. What you noticed as a matter of fact was that the north wall was a new wall?

A. Somebody, I don't know who it was, told me the thing was falling down, somebody standing on the track.

Q. Was it Mr. Dobson?

A. No, sir; nobody connected with the city.

2516 Q. What you know yourself about it is that you saw a new wall there?

A. Yes.

Q. The reast you volunteered?

A. I think it was a brakeman, somebody connected with the railroad told me.

Q. Notwithstanding the fact that one wall was new you have treated that wall as old?

A. No; on the contrary, I put it in fair condition, raising it out of its class.

Q. You thought that justice required that it should be bad, I suppose. Now, then, take the next building, section 16. That is brick and steel construction, one story high, the walls of brick and lime mortar, floors of concrete on earth, the roof slate, steel purlins and trusses; how did you classify that?

A. Depreciation, store building, 8 years, fair condition, 17 per cent.

Q. Do you think that a building of this kind would depreciate as rapidly as an ordinary brick store or residence?

A. Wherever there is any reason to believe that the foundations have the slightest vibration from the movements of the machinery and wherever there is high speed machinery, the question of depreciation at once becomes a very serious one. There might be, if I had the time to observe a larger depreciation; as it was, I could do nothing more than what I saw as I walked through the place, to call it in fair condition.

The complainant moves to strike the answer as not responsive and asks that the question be read to the witness.

(Question read.)

2517 A. More rapidly.

Q. Now take the boiler house extension, that is brick and steel construction, one story high, foundations of concrete and brick, cement mortar, the north and west wall of brick and cement mortar and the east wall of structural steel, covered with corrugated iron, floor brick, cement grouted, roof corrugated iron steel purlins and trusses; did you classify that as an ordinary brick store or dwelling in giving it your depreciation?

A. I should call that below the grade of store buildings, but have classified it as a store building, brick, fair condition, one year depreciation, 3 per cent.

Q. What machinery is there in the last two buildings we have mentioned, building 6 A & B?

A. To what page do you refer?

Q. I refer to the buildings I just mentioned 6-A & B?

A. On page 66, Exhibit 15, furnished by the company, all of the machinery reported by them is enumerated under the head of contents of boiler and engine room, building 6-A & B.

Q. What there is in these two buildings is some boilers and engines and their appurtenances?

A. Yes.

Q. That constitutes all of the machinery in these buildings, does it not?

A. Speaking of cast iron piping erected also.

Q. Do you classify that as machinery?

A. Well, it is a part of the machinery of the gas works segregated here.

Q. It is put under the head of piping in the inventory, is it not, not under the head of apparatus?

A. Yes, it is put here under the head of piping.

2518 Q. You classified it as machinery?

A. Under the head you call apparatus and foundations, do you notice it.

Q. Yes, you run on down and you call the whole thing apparatus, do you?

A. Just put it that way, beginning with the foundation.

Q. Now, then, are these boilers and engines on foundations of their own which are separate from the foundation of the building?

A. The floor was brought right up to them, so that I would be unable to say, although I assumed they were.

Q. Now, are these boilers set in brick?

A. Brick around them—a fire place.

Q. Is it your idea that these boilers and engines will jar sufficiently to weaken the foundation of these buildings in the absence of an explosion?

A. Yes, the slightest vibration will do this in almost any build-

ing, even a tremor, hardly perceptible to the senses, as a serious effect on the building.

Q. Would you anticipate that the effect on this building would be extraordinary or about the effect we have normally from the operation of boilers and engines on separate foundations in buildings?

A. I should say that would be about a normal result in this case and for that reason assumed the depreciation percentage of an ordinary warehouse or store given by Mr. Somers.

Q. Now, let us have the next building.

A. Building 6-C boiler house extension.

Q. Now that is also brick and steel construction, 2 years old, one story high, foundation of concrete and brick, cement mortar, the north and east walls of brick and cement mortar, the east wall of structural steel covered with corrugated iron, the floor brick,
2519 cement grouted, the roof corrugated iron and steel purlins and trusses. Did you classify that in the class covering brick stores and residences of Mr. Somers, and what condition did you give it?

A. Store building, brick, fair condition, depreciation one year, 3 per cent.

Q. Now let me ask you generally, did you find anything that was conditionally considered good?

A. Yes.

Q. What was it?

A. It was your new installation of generators.

Q. I mean in buildings whose condition you considered good?

A. Yes.

Q. What was it?

A. It was your new installation of generators, there is nothing really first class that I know of.

Q. I am not talking about the building itself, that is the way it is designed, but did you find any building that was in what you call good condition?

A. You mean first class material or good of its class?

Q. I am talking about the condition of the building; did you find any building over there that you classified as in good condition for the purposes of ascertaining your depreciation?

A. Will you allow me to explain in regard to the generator house?

The MASTER: Just answer the question.

A. I did not.

Q. All right; that is all I wanted to know. Now take the next building, generator house #7, brick and steel, two stories high, concrete foundation, the north, south and west wall brick, the east wall timber construction, corrugated iron wood frame in roof;
2520 first floor concrete and brick; second floor cast iron plate steel supports; stairs structural steel and wood. How did you classify that building?

A. Will you allow me to correct a mistake?

Q. Would be glad to have you do so.

A. I see in the case of this building I made a mistake classifying it, condition good, depreciation for 4 years, 8 per cent, and should

have on account of a possible vibration of that building put it in a lower class; I have, however, I see, classified it as good.

Q. If you are resolving doubts in favor of the company, as you state all the time, shouldn't you, if it is only a possible vibration, have done the reverse?

A. I have done so.

Q. You done what you ought to have done?

A. You may put it in that way if you wish; it is evident I was in a very generous frame of mind.

Q. That is what I want to emphasize. You know there is an old adage about the proof of the puddin- being the eatin- of it—now then take your next building, coal and coke shed, 8-A?

A. That is a frame building on brick foundation——

Q. I asked you about that once before.

A. Yes, you did.

Q. Now did you make any difference in your classification for depreciation purposes between the building that you referred to as being built with these old mud brick, and all of the other charming characteristics, and these buildings that were built within the last two or three years of brick and cement mortar, steel roofs, and so on, or did you apply the same rule to each class of buildings?

2521 A. No, it appears the result of the use of mud brick appears in the depreciation more particularly.

Q. I asked you whether you applied the same rule from Somers to each of the two classes of buildings I mentioned?

A. No, because you take the case of the building in the northwest corner which was away past any power of Somers to cover.

Q. You didn't apply Somers' rule to that one. Take the purifying house for instance, which I think you devoted considerable attention to, did you apply the same rule to that building, 18 or 20 years old, constructed as you have said, that you have applied to these buildings I have just referred to, of brick and steel construction?

A. I applied the same method, Somers method.

Q. And classified them the same?

A. I did not. I classified the new #7 building as good, and by a generous attitude of mind was able to classify the purifying house as fair.

The MASTER: What do you mean by fair?

A. Somewhere between being good and absolutely bad.

The MASTER: That means fair for the kind of a building?

A. Yes, didn't look as though it had been abused; didn't look as if the material was absolutely worthless to begin with.

The MASTER: Of course, if it was fair, it would not be absolutely worthless?

A. Bad to begin with.

Q. Let me follow that up a little. What characteristics must a building have to be classified as good?

A. Such as your generator house #7 has.

Q. That is a conclusion; name the characteristics?

A. I don't know your local brick here; if you will take
2522 one of those bricks you will find it is hard burnt and rings, and that it is liable to be very durable. There will be no disintegration under the action of gas which *are* peculiarly active around gas works. You will find also if you will examine——

The MASTER: Let me ask you a question there. You spoke about mud brick. What do you reckon the life of a brick building built with mud brick?

A. Of course mud brick is indigenous to the town of Des Moines, and of course my observation of it is limited. If you will take the trouble to examine the building on the northwest corner of th*the*ir property, you will find brick there where you can take out your pen-knife and it will run down——

The MASTER: What is the life of that building?

A. It is 34 years, I think; I should think it was a little past its natural life.

The MASTER: I know brick buildings of that character double that age now. I want to know what you rated it at?

A. I should say 34 years would be about the limit of the life of the quality of brick they have there.

The MASTER: It is the kind of brick all the buildings in Iowa were made of in an early day?

A. The same kind I presume.

Q. What do you mean by a mud brick that you say is indigenous to Des Moines?

A. It is like these 16 brick in a cubic foot I sho-ed you here. I can bring you one in.

Q. I wish you would describe it so that we can see whether we can get some definite idea as to what you have in mind?

A. It is a brick which is not pure clay. It is a brick which has either not been burned sufficiently or which they are unable
2523 to burn sufficiently to take it out of the class of salmon brick, or imperfectly burnt brick. It has the characteristic of having rounded corners, not sharp ones, and if you will examine it after being, for instance, up against the gases in the old generator room, you will find that it disintegrates, and you can take your pen-knife, and you will find the old-fashioned mortar harder than the brick itself.

Q. Brick, today are burned harder than fifty years ago?

A. I don't know.

Q. All over the country?

A. I don't know.

Q. You said a salmon brick, do you refer to the color?

A. That, and being imperfectly burnt; the trade name for bricks not fully burnt is salmon brick.

Q. The color of a brick depends on what?

A. On the amount of iron in it generally.

Q. On the amount of iron in the clay, don't it?

A. I wouldn't specify it should be in the clay; you frequently see spots in the brick of iron which you can hardly call anything more than a mechanical mixture in the clay.

Q. Are these so-called mud brick made of clay or not?
A. Not pure clay.
Q. By pure clay, do you mean technically pure clay, kaolin?
A. I mean free from sand and silt which comes from overflows.
Q. Your theory is these brick were made out of a substance not entirely clay, but contained this silt and that results in soft brick?
A. Impurities; I won't say what they are; certainly not pur- clay.
Q. You couldn't make brick out of pure clay, kaolin?
A. I don't know anything about the crockery business.
2524 Q. I am not asking you about the crockery business; but do you know anything about the brick business?
A. A little.
Q. Then we will stick to that—you couldn't make brick out of pure clay?
A. I think I could; I think you can make elegant brick out of pure clay.
Q. You couldn't make vitrified brick out of pure clay?
A. I should think you could come pretty near it, but you would need some glazing material in it.
Q. Pure clay will not fuse, will it?
A. Except at very high heat.
Q. At what temperature is it your notion kaolin will fuse?
A. I don't know anything about the crockery business.
Q. To make vitrified brick you must fuse this mass with something that will permeate the mass?
A. I should think on the surface you would do well enough, without permeating the mass. I don't know anything about the crockery business.
The MASTER: It takes a 3,000 temperature for vitrified brick?
A. I haven't the slightest knowledge of the crockery business.
Q. Now turn to section 20, did you use Somers on the depreciation there—runway coal and coke shed?
A. I think I have already answered that question, stating that I used 3 per cent for 9 years, Somers' system.
Q. I am talking about section 20 at the top of page 25?
Mr. BRENNAN: Section 20 has reference to the scales.
Q. Turn to the top of page 25, the second line on that page, did you use Somers on that?
A. That is a set of Fairbanks' Standard Scales, the depre-
2525 ciation was by inspection.
Q. All right, I was wrong. Now speaking generally in using your Somers table, have you classified the structures here either as brick stores and dwelling-, that is, taking the table he applies to brick stores and dwellings, or the table which he applies to frame dwellings?
A. Yes.
Q. What is the heading of the table he applies to frame buildings?
A. Store buildings and dwellings.
Q. Does Somers anywhere in this pamphlet you have there or whatever it is give rates of depreciation on factory construction?
A. So far as I am able to locate, he has confined himself and in-

cluded all buildings under store buildings, dwellings and office buildings, meaning by that the type of buildings known as sky-scrapers.

Mr. BRENNAN: Is that store buildings and dwellings?

A. Store buildings and dwellings and office buildings, meaning by the words office buildings the type familiarly known as sky scrapers.

Q. What is his language in describing what he means by office buildings?

A. The highest class of steel construction buildings.

Q. Now does Somers give any table there covering what we call slow burning factory construction?

A. No.

Q. That is given in the table there covering ordinary brick and steel construction?

A. No that comes under the head of store buildings and dwellings as I understand it.

Q. Now turn to page 25, 20-A.

A. I have it.

2526 Q. You have first a steam hydraulic elevator there. Where would that be purchased?

A. I don't know.

Q. Does your $1,500 mean the price of this apparatus in place?

A. $1,697 means my estimate of the price of the apparatus in place.

Q. Is this something that is kept in stock by manufacturers?

A. No, can't be; because there are different lifts of these hydraulic elevators. I don't know what their habits are——

Q. Then it would be necessary to design these first, would it?

A. To the extent of taking the top measure, getting the distance you want to lift your stuff; the manufacturer would furnish the rest.

Q. What would the apparatus cost, not in place, but f. o. b. cars at the place where it is manufactured?

A. I don't know.

Q. Do you know anything about it?

A. Yes.

Q. Then tell us approximately what it would cost f. o. b. cars at the place of manufacture?

A. Approximately, I cannot give you that. Of course I am not a sales agent. It is my estimate it would cost about $1,500 or $1,600 for the lift to be 16 feet which is there, and the necessary apparatus that goes with it, that is the amount in round figures I should judge it would cost. Of course the books are the best evidence. You have the records and you have the invoices and the bills.

Q. The books are not the best evidence of what you know about it, that is what we are trying to get at. Now, then, how can you get anything like an accurate estimate of what it will cost in place without knowing first what your manufacturer's cost would be?

2527 A. Just as I could tell you, being skilled in the art of the probable value of a horse, by looking at it, and what I think he is worth and what I would be willing to pay for it, the same process.

Q. Let us see if it is. You judge the value of a horse by comparing that horse in your mind with what other horses will sell for?

A. It is an intricate process of unconscious cerebration.

Q. How can you judge the value of this thing without knowing what something else just like it does cost by your horse process?

A. Well, such a statement is correct; I have no doubt I have in my mind the average cost of a number of those which I have seen elsewhere, but I did not take the trouble in this case to do so. As I said before, the true and exact cost can be obtained at once from your vouchers.

Q. Having these things in your mind, where you are looking at the horse, your mind unconsciously gives you the benefit of them. Let us look at this and you tell us what in your mind the manufacturing cost of this would be?

A. I shall have to decline to answer that question. I think it is worth about, nearly $1,700 in place there and refer you to your own books if you want to know the exact cost.

Q. I have already told you, what we are after is what you know.

The MASTER: I think the witness has explained what he knows now.

Q. Then what would it cost to install this apparatus, or rather what in your estimate did you take as the cost of its installation?

A. $1,697 was what I have given you here as the total structural cost installed, and somewhere about $1,500 as the price probably delivered.

Q. Delivered where?

2528 A. Here.

Q. And your $1,697 is obtained by adding to the $1,500 supervision, general management, interest and taxes?

A. About that, yes.

Q. So that it does not include the item of erection about which I asked you?

A. Yes, cost delivered here $1,500. I should perhaps add a rate for your contractor to put it in that way.

Q. I want to know what these things would cost or whether you know what it would cost?

A. I wish to say with the utmost emphasis and frankness that I told you repeatedly this is an estimate and if you want the exact facts you have them in your own books and vouchers and it *it* is futile piffle, to use the phrase, and at which you laughed a good deal yesterday.

Q. In other words, is that a brief way of stating that you don't know?

A. I know well enough to know that is the outside limit of value which I wish to place.

Q. If you know, will you tell me what it would cost to install it?

Mr. BYERS: I submit the witness has fully stated what his judgment is and how he got at it and all about it.

The MASTER: He has not stated a word about the cost of installation.

Mr. BYERS: He has twice stated it was included in this cost of $1,697.

Q. I want to know how much he included; if he don't know, let him say so.

A. I told you very frankly I didn't know anything more than what is in my general estimate.

The MASTER: Do you know what it would cost to put
2529 it up?

A. After it arrived here?

The MASTER: Yes, that is what he wants to know; if you don't know, just say so.

A. I can give you a rough estimate, if you want; if the Master wishes to know, I can do it.

The MASTER: That is the question. Answer it if you can.

A. I should think after it landed here, by the time they got the platform sunk and the hole bored for the plunger and the foundations for the engine and hoisting machinery, in the neighborhood of $200 or $250 would have been spent in addition to what they probably paid for the machinery to the factory. But of course, as I look at it, their own vouchers and books will give it exactly.

Q. Now, then, tell us the name of some available manufacturers of these apparatus.

A. I can't recall one.

Q. Tell us the last apparatus of this character which you installed or which was installed under your supervision, I mean as to date, the most recent.

A. In gas works?

Q. Or any other works?

A. I think somewhere about 1900, in Fostoria; I didn't pay very much attention to it.

Q. Do you know whether they put one in or not?

A. They did, to punch their coke up to the platform of the water gas process.

Q. That is the extent of your experience with reference to installation for the purchase of apparatus of this character?

A. As far as I can recall at present.

Q. Did you write any letters to anybody and ask them what this cost?

2530 A. I don't know what my assistants may have done; I certainly did not, because I didn't take the trouble.

Q. Now, turn to section 22; will you please without going into details, specify any apparatus covered in that section which you have recently bought or sold or as to which you have information as to recent actual prices?

A. I have been in the employ *for* the city of New York for the last five years as an estimator and consequently not actively engaged in the business, but I have had to buy a lot of grind stones, emery wheels, and I have paid for anvils, and a complete soldering outfit, counter-shafting, and I have rather a complete shop of my own. Of course the Buffalo forge drill press and screw cutting lathe are standard materials, so that I have not been forced, as your engineers

have been, like myself, to make inquiries of people who dealt in them.

Q. That I don't think answers my question exactly. Have you specified each of the things here which you have either bought or sold recently or of which you have recent information as to the actual prices paid?

A. Grind stones, emery wheels——

Q. I asked you whether you had specified it?

A. Yes.

Q. Now, digressing for a moment, on your direct examination you stated there were a number of these buildings that had been built out of scraps lying around and that were useless for any other purpose; will you tell us which buildings they were?

A. Particularly, what you call the oil barrel store house, is a sort of a bird cage arrangement where the men found it convenient to pile the barrels outside of instead of inside.

Q. What other buildings?

2531 A. Then you have what you call the fire brick store house which is also of the same general character, scrappy construction, for instance, you mentioned the old holder oil tank there which happens to be an old boiler turned up side down with the steam dome used for the purpose of drawing oil from it; and there happens to be another old boiler——

Q. I asked you about buildings built out of scraps—if you can just concentrate your mind on that I will appreciate it.

A. The coke shed for instance which is specified across the street is at the present moment a very old building and in scraps——

The complainant moves to strike the answer as not responsive.

Q. You stated certain buildings were apparently built out of scraps, boards, and I ask you to name them, and you talk about boilers and things like that, and you name two small buildings; were there any other buildings that in your judgment were built out of scraps of boards, if so, what were they?

A. You mean wooden buildings entirely?

Q. If you know any brick buildings built out of scraps and boards put them in?

Mr. Byers: Didn't you put in scraps of boards? The witness I think stated scraps.

A. For instance, you have what you call a rubbish kiln which is valued at a considerable amount of money; this is a brick building drawn with a great deal of care and built out of old brick.

Q. You say valued at a considerable amount of money, how much?

A. I forget, I will look it up.

Q. I wish you would.

A. The structural cost new $23.18; present value $11.59; which was built out of old brick and has no value at all except that

2532 it is useful for the purpose for which it is intended.

Q. Do you know anything that has much value that is not useful for the purpose for which it is intended?

Mr. BYERS: That is hardly a proper question.
(Question withdrawn)

Q. Can you identify any other building in addition to those you mentioned that you claim is over here and built out of odds and ends of lumber?

A. There is a lean-to against the purifying house, which is not built out of lumber but is made out of an old column of some corrugated iron.

Complainant moves to strike the answer as not responsive and asks that the question be read to the witness.
(Question read)

A. For instance, the dipping trough—I don't know whether you call that a building or a piece of machinery—looks as though it was built out of picked up lumber, and it is not in good condition.

Q. What is the dipping trough used for?

A. Dipping services in tar.

Q. And the tar trough is used for what?

A. Dip service pipes in tar.

Q. When you say dipping trough and tar trough, do you mean the same thing?

A. Yes. That is about all I can recollect at the present moment.

Q. If you think of anything else, let me know. Now take page 28, you have a Davidson pump 6 by 8 by 12; how recently have you bought a pump of this class, or has one been bought under your supervision so that you have some personal knowledge about it?

A. Are you referring to the oil pump there, are you not?

(Question reread.)

2533 A. It has been a good while since I bought a pump of that sort; that price is altogether too high; I don't know how much too high.

Q. Do you know what a pump like that is worth in the market?

A. Looking at that now I consider $250 a big price for it.

Q. Do you know what a pump like that is worth in the market?

A. No, I don't know; I should consider $250 a big price for it. I recall it, it is underneath the fence there in the brick house where you unload oil, if that is the one.

Q. I don't know whether it is or not; I supposed you were familiar with those things; do you know really what pump this is that is referred to?

A. That is the one I assumed used for pumping oil out of the tanks.

Q. Did you just guess at this $500?

A. It is evident I did; I overestimated it, I can see that now, since you called my attention to it; I probably over-estimated it double.

Q. You found, didn't you, when you checked with the reports of our engineers that $250 was about right, and you had not checked with those reports when you made your Exhibit 23?

A. As a matter of fact I have not used your engineer's reports in any manner to check my work; I wouldn't look at them.

Q. Who did tell you this was wrong?

A. Nobody until you brought it up.

Q. You just hadn't given it any consideration?

A. It was evident to me at once that it was one of those slips I and everybody else will make.

Q. Now, you have under section 29, station meter; how are they customarily bought, installed or not?

A. The maker of a large station meter is expected to
2534 deliver that in position and in perfect working order.

Q. Then if I understand what you mean is that they are customarily bought installed; that was the question, whether they were or not?

A. The word installed may mean a great deal. It may mean putting in the foundation, in fact almost a building around them; it may mean simply they will put the meter in.

Q. What is the customary method?

A. There is no customary method beyond what I have stated to you, to make the maker entirely reasonable for the accurate performance of the meter.

Q. Do you know who builds those meters?

A. You mean these big station meters?

A. Yes.

A. The Goodwin people, the American Meter Company; you can see it on the label.

Q. It is customary for them to sell them at a price which includes the foundation and the meter in place?

A. I do not think they put foundations in; I think they furnish a drawing and you do it and then they put it on top. The main point is to guarantee the accuracy of the performance of the meter itself.

Q. By the way, I forgot something a while ago. Tell us what gases generated in the making of water gas have deleterious effect on brick?

A. All the sulphurous gases have a deleterious influence straight through.

Q. What are all these sulphur-us gases that have this effect on brick?

A. It is impossible to say.

Q. Can you name any of them?

A. Well, more commonly known as sulphuretted hydro-
2535 gen, known by its smell.

Q. Do you know any other?

A. There are a lot of gases. You are asking me a question the best chemist of gas in existence couldn't answer; men who spend their lives working on gases, if they are the real stuff, will tell you flat-footedly there is lots of gases that they have not succeeded in separating.

Q. I asked you whether you could name any other?

A. No, I can't; I am not a chemist.

Q. Do you mean that the chemists who have devoted their lives to it could name but one, which you have named, the odorous gases?

A. You are asking me to speculate.

Q. You speculated a moment ago by telling us what these chemists couldn't do.

Mr. BYERS: This is all argument; it has cost too much money to fool with those things.

Mr. GUERNSEY: How long did you cross examine one of our experts?

Mr. BYERS: I was trying to get somewhere all the time.

Mr. GUERNSEY: A great deal depends on the point of view.

The MASTER: You claim it is satan rebuking sin.

Q. I notice a curious thing in this meter house to me; that is the brick you figured 1.6 cents, why was that?

A. Isn't that the same as $16 a thousand?

Q. I think it will give you the same result; how did you happen to figure them by the cents, or do you know?

A. No; I think I am responsible for that.

Q. Then why was it?

A. I had very little time and hustled along and put it in in that way. Remember we didn't begin this thing until a few weeks ago.

Q. When was it?

2536 A. The computation on this I should say began six or seven weeks ago.

Q. Did you look up that date I asked you about when Mr. Hazard came here?

A. No, I did not. But that was about the time the computation began. I forgot to say that I brought the Cleveland reports here.

Q. I thank you, I will look at them.

A. Also such correspondence as I had in regard to machinery of various manufacturers.

The MASTER: Will you turn to your report at page 83?

A. I have it.

The MASTER: The figures you get there are from the books?

A. From the books of the company.

The MASTER: They were furnished you?

A. By the city's accountants.

The MASTER: Now I notice here beginning with 1906, the last column gives the total cost of manufactured gas; how many months is that?

A. For two months.

The MASTER: At 67.14 cents; and then I find in 1907, 64.90. Is that correct?

A. Yes.

The MASTER: Then for 1908 it is 63.50 cents?

A. Yes.

The MASTER: Is that the total cost?

A. That is the total cost at consumer's meter.

The MASTER: Now I notice 59.72 cents for the whole year, is that it?

A. Yes.

The MASTER: What is the 63.50 cents for, for the same time?

2537 A. That is for the whole year ending February 1908.

The MASTER: 64.90 cents, what is that for?

A. For the year ending February 28, 1907, 64.90 cents.

The MASTER: Now the 62.56 cents, what is that for?

A. That is for the ten month- ending December 31, 1909, 62.66 cents.

The MASTER: What is 65.30 cents for?

A. That is for the whole year ending December 31, 1910.

The MASTER: What is the 62.74 for?

A. That is an average of four years ending December 31, 1909, 62.74.

The MASTER: Now, then, what is 63.33 cents for?

A. That is the average for five years ending December 31, 1910, 63.33.

The MASTER: That is not for the year, but the average for four years and the other an average for five years?

A. Yes.

The MASTER: That 65.30 cents for the year 1910 includes these attorneys' fees and that $10,000—$15,602?

A. Yes. About $16,000 or $17,000 over and above the preceding four years.

The MASTER: So that the average for the whole time including that is 63.33 cents?

A. Yes.

The MASTER:

Q. Separating that from the five years would make six cents difference?

Mr. GUERNSEY: That six cents was added on account of depreciation.

A. Residual depreciation being depreciation not able to be cured by thorough repairs, I added six cents on top of the 63.33 cents.

The MASTER: The actual cost of gas outside of that you figured and average of 63.33 cents?

A. Yes, sir; including——

The MASTER: You included 65.33 for the year ending 1910?

2538 A. Yes.

The MASTER: There is another matter here I want to understand. You will find it on page 76.

A. I have it.

The MASTER: Now what is that figured on here, for instance, is that figure on the whole amount of pavement?

A. Pavements claimed by the company $204,094.

The MASTER: Do you figure that on the whole length of the pavement that are now over or was, December 31, 1910, over mains?

A. I do.

The MASTER:

Q. Can you tell me by reference to the inventory the amount that you figured, the number of feet?

A. On page 66, section 86, I have the items as follows: Asphalt on concrete——

The MASTER: That is not answering my question. I want the whole number of feet that are figured as being over mains, don't make any difference what kind of pavement.

A. On page 68, section 87: Cost of lifting pavements on street gas mains the whole length of pavements claimed to be over street gas mains from the records of the company is 443,577 lineal feet.

The MASTER: That is what I wanted. Referring to the inventory, is that the number of feet you figured?

A. That is the number of feet I figured for lifting pavements; and then I had figured the cost of making pavements by the square yard

The MASTER: How much did you put that at?

A. On page 66 I gave each kind of pavement, the number of square yards of each kind of pavement, the price per square yard and the sum total of the various kinds of pavement, amounting to 112,045 square yards, $204,994. or about $205,000. in round figures.

2539 The MASTER: This $204,994. and $28,242. includes the cost of lifting the pavements and replacing them and laying the mains for the entire 443,577 feet?

A. It does.

The MASTER: Page 66 gives the items and amount you figured on the different kind of pavement?

A. Yes, sir.

The MASTER: How many lineal feet will make a square yard?

A. I can give you an average by taking 112,045 square yards and dividing it by the total length in feet, which will give you the fraction of the yard to each foot.

The MASTER: What is the width they have to replace pavements?

A. Well, about three feet, I should say; I have it liberally worked out in the blue print exhibit.

The MASTER: Three feet wide and three feet long would constitute a square yard?

A. Yes.

The MASTER: Every three feet there will be a square yard of pavement to lift and replace?

A. That is with the larger size mains.

The MASTER: The average will be about two and a half?

A. The smallest ditch to work in is about 18 inches. About as little pavement as you can cut is about two feet, and if you don't look out and give the men their way, they will have two feet and a half.

Mr. GUERNSEY:

Q. Will you turn to page 83 of the inventory and tell me what the reasonable value of the one vapor extractor as there specified is in place?

A. I lumped that whole apparatus at $60,000.

Q. I know you lumped it. Do you know what the reason-
2540 able value of one vapor extractor such as is described here is in place?

A. No; I didn't even know you had a vapor extractor there when I got to that.

Q. You didn't pay any attention to details of that kind?

A. I happen to have in my possession a contract for almost exactly the same outfit you have here at $45,000 and looking over the contract and finding it was equivalent capacity, nearly, I made such additions as I thought necessary and let it go at that.

Q. Where was that apparatus covered by that contract to be erected?

A. It was erected in Cleveland.

Q. When?

A. A few years ago.

Q. How long ago?

A. I don't recall; not more than seven or eight years at the outside.

Q. Look at the contract and give us the date?

A. I haven't it with me.

Q. What was the size of the water gas sets?

A. Three 8½-feet water gas generators.

Q. What did the contract specify to accompany them in the way of accessories?

A. Everything necessary excepting the buildings.

Q. Did it cover foundations?

A. Oh, foundations, no it didn't. I have added those separately for the apparatus in this case.

Q. That contract is the knowledge you have which is the basis of your estimate on what apparatus is covered by page 83 of the inventory?

A. It is authentic knowledge, second only of course to your books, which of course is the best evidence every time.

Q. I will reiterate as frequently as you do—the fact is
2541 what we desire to learn is not what the books show, but what you know; now to go back to the question, is that contract or copy of that Cleveland contract the only information you had as to the basis of your estimate of the apparatus described on page 83 of the inventory?

A. It was the only information I used.

Q. What other information did you have if any, that you could have used?

A. I can't answer that question; it is too broad.

Q. Did you ever buy a water gas set?

A. I think I told you yesterday that I settled for a little six foot set; I didn't buy it.

Q. Aside from that little set in Fostoria——

A. We went over it yesterday.

Q. All right. Will you produce this Cleveland contract for us this afternoon?

A. I think I have it; it is $45,000. I can tell you what it is.

Q. I want to know whether you will produce it here for us this afternoon?

A. I will if I have it complete. I have certainly a memorandum. If I have it complete I will be glad to produce it if the Master cares to see it.

Q. If you haven't it, will you send for it so that we may see it so that we may have your basis for your estimate to use in our cross examination?

A. I will look it up and bring it along.

Q. Who gave you that copy of the contract?

A. I shall have to decline to answer. I have it.

Q. Of course I don't want to ask you, if it will embarrass you at all to answer it, I won't press the question. It would embarrass you to answer, and I presume that is the reason for your re-
2542 fusal?

A. I shall have to decline to answer.

Q. Or is your reason purely because you are arbitrary?

Objected to on part of defendants as being immaterial.

The MASTER: I don't know that it is material.

Q. Now do you know the present value of any single item of apparatus mentioned on page 83 of the inventory?

A. I didn't figure out any of them, having the sum total near enough for the purpose.

Q. I don't think you understood the question?

(Question read.)

A. I make the same answer.

Q. Do you know the value of any single item of apparatus?

A. I did not estimate, consequently can not know.

Q. Turn to page 111 of the inventory.

A. Yes.

Q. Do you know the present value f. o. b. cars at the place where it is manufactured either of the pumps mentioned there, Benson or Warren?

A. No, I looked them over and calculated they were worth a couple hundred dollars a piece and let it go at that.

Q. Then you don't know the value of either of them at the place of manufacture f. o. b. cars?

A. I haven't the price list.

Q. Can you answer whether you know it?

A. I do know. I say about $200 the outside limit.

Q. How much variation is there in the size or capacity of these pumps?

A. The pumps you will notice in duplicate, 6 by 7 by 10, large size; then they go on down 4½ by 3½ by 6. They seem to be of about those two sizes.

2543 Q. What would be the minimum price f. o. b. cars at the place where it is manufactured of any pump mentioned on this page just referred to?

A. I thought as I look- in the door I thought some about $70 and others went up considerable higher.

Q. Do you know what the price of either of those pumps is f. o. b. cars at place of manufacture?

A. No, I didn't take the trouble to write for a price list; I presume you did.

The MASTER: I think that is a complete answer to that question.

Q. Do you know what it would cost to install either of those pumps?

A. Do you mean the foundation?

Q. I'll change the question. The total cost that you would have added to the price f. o. b. cars where it is manufactured, to get the pump in place in the works, ready for use, without any overhead charges in it?

A. I took it for granted looking the matter over, a matter of general judgment entirely, about $200 as about what these pumps would cost installed, foundations and piped up. I think I was right about the matter. I still think I am perfectly right about the matter. I know it is considerably over-estimated in favor of your company.

Q. All of your estimates have been made over-estimates?

A. If I have made any serious variation amounting to anything it has always been in favor of the company, you will find.

(Question repeated.)

(Answer repeated.)

(Question repeated.)

A. First of all, I don't know freight rates on pumps. I judge that the smaller pumps would be built at about $70 and $75
2544 net. The larger pumps about $200 to $250 net. That the average would fall somewhat below about $160, and that about $40 each on an average would cover the amount necessary to get them ready to go into action; that was all that I did.

Q. Can you tell me as to either of the pumps which we have been discussing what the additional cost would be taking the pump f. o. b. cars at the place where manufactured, and incurred thereafter until the pump is installed in the works without overhead charges?

A. I have already stated that as nearly as I can. I did not send for a price list.

Mr. GUERNSEY: It may be conceded that the witness did not send for a price list.

The MASTER: I think he stated everything necessary.

Q. Now, turn to section 44 of your report and take the relief holder at page 36?

A. Yes, I have it.

Q. Now that holder you estimated at so much per thousand cubic feet of gas?

A. $175. per thousand cubic feet of gas contents.

Q. Now how do you get at a figure like that $175.

A. Per thousand cubic feet gas contents—because in the case of the inventory in New York City there was a score or more of these old-fashioned gas holders with practically tanks just like it and about $175. per thousand cubic feet contents appeared to me to be a very liberal estimate of the cost of the construction of such a holder at the time when it was constructed.

Q. Now, boiling that down, you took it from a cost you put on the New York holders?

A. Yes.

Q. Did the Master in New York accept your valuation?

A. He did not.

2545 Q. Did the court accept your valuation?

Objected to as not the best evidence and immaterial.

The MASTER: I don't think so myself.

A. Do you refer to the Supreme Court of the United States?

Q. No, to the lower court.

Objected to as immaterial and not the best evidence.

A. It would be difficult to answer that question.

The MASTER: What has that to do with this case?

Mr. GUERNSEY: The only materiality I claim for it, the witness has testified he was accepting and using here valuations that had been to such an extent discredited in New York that they were not accepted by the Master or Court.

Q. Now, then, how did you get at the $175 in New York?

A. Because I and my assistants had to compute a very large number of small gas holders of the general appearance and size of the old relief gas holder you have here. As soon as I looked at it I recognized an ancient acquaintance and put it down $175 per thousand cubic feet.

Q. Have you any idea what the question was?

A. Yes; how did you get at it.

Q. Did you get at it in New York by coming out here and recognizing this holder?

A. I supposed you referred to the value per thousand cubic feet capacity.

Q. How did you compute in New York this value of $175 per thousand cibic feet capacity, what basis have you for that?

A. Please read my previous answer.

(Previous answer read) to which the witness added: which is the price I had found to be a good average in New York City.

Complainant moves to strike the answer as not responsive and asks that the question be reread.

2546 The MASTER: I think that is. He said in his judgment that was a pretty fair average.

Mr. GUERNSEY: The question is how he got at this computation in New York.

The MASTER: I don't know whether he explained it fully or not; if that is what he intended for it.

Mr. GUERNSEY: If that is the way the witness wishes to be understood; I didn't so understand it. I want to ask one or two other questions.

Q. When were those holders of this size in New York built?

A. I can't answer that question, but I can say that they are old holders, of course.

Q. Naturally.

A. Yes.

Q. And a holder of this size would naturally be older in New York than in Des Moines because New York outgrew this holder much sooner?

A. I beg your pardon—New York still has horse cars and small gas holders.

Q. Didn't New York generally outgrow the holders of this size sooner than Des Moines did?

A. No; it has got holders smaller than this and in use. So it has not outgrown them.

Q. What size holders are they building in New York now?

A. I think about five million cubic feet capacity, the smallest.

Q. What is the largest?

A. Fifteen million cubic feet.

Q. What are they building?

A. Fifteen million cubic feet.

Q. When, so far as you know, was the last holder built in New York with a capacity of about 175 thousand cubic feet?

2547 A. I should judge about the same time as this, 25 or 30 years ago, as the holder here I mean, about the same time.

Q. They were built of that size for use in New York at that time?

A. Yes.

Q. Now, then, did you ascertain in order to make the New York figures, what holders of this size were costing at the time you made your figures in New York?

A. I had some of the figures of Tom Rowland who was a big gas contractor in New York City. I had the figures of others as to the matter of cost, the results of some investigations of books, and for the time and when this type of holder was being built I carried in my memory as being just about as near right as you can get it, did actually cost then $175 per thousand cubic feet.

Q. Then as nearly as you could ascertain in New York the holders of this class cost when they were built in New York 25 or 30 years ago, $175 per thousand cubic feet?

A. Yes, meaning by that holders with brick tanks anchor columns and usually with one lift and sometimes with two lifts, but not over 200,000 cubic feet capacity.

Q. You took the cost of these holders in New York 25 or 30 years ago as your value on this holder in Des Moines as of January 1st, 1911, or November 31, 1910?

A. I did, it being the best I could do, without access to the books; but it turns out on comparison with the books, that the estimate made at that time subsequently proved very close as to the structural cost.

Q. Have you compared this with the books?
A. Personally no.

Complainant moves the witness' statement as to comparison as being incompetent, hearsay and secondary.

2548 The MASTER: So far as that question is concerned, I do not understand that he any more than meant to say in the absence of the books.

(Last answer read, to which the witness added): In other words, the accountants for the City were overhauling the books——

The MASTER: The books are the best evidence.

Q. Do you mean the accountants for the city of New York?
A. For the city of Des Moines were overhauling the books.

The MASTER: Do I understand you to say you computed this rate of $175. per thousand cubic feet of gas which they would hold?
A. Yes, capacity of gas.

The MASTER: Did you compute the larger holder at that rate?
A. No, the large holder I computed at about 100. per thousand cubic feet capacity, the million cubic feet holder. The smaller your holder gets the larger the cost per thousand cubic feet capacity.

Q. Did you ever buy one of those holders, or has one been bought under your supervision so that you know the actual price from your own knowledge, paid for one at any time?
A. Let us see—I forget the size of the holder at Fostoria. The holders at the Laclede Gas Works were quite good size for that day, but I forget their capacity.
Q. You mean the St. Louis Laclede Gas Works?
A. Yes. And the holder at Durham, North Carolina, was quite a small one and quite costly. My figures are placed on the New York results in this case, on numerous computations.

The MASTER: I notice you computed the 300 thousand cubic feet holder only at $150.
A. The 300 thousand is comparatively old-fashioned; they were expensive things in those days; they are getting cheaper now.

2549 Mr. BYERS: I would like to have brought down at the convening of court this afternoon the two record books containing the records of the meeting of the directors and stockholders of the Capital City Gas Light Company and the Des Moines Gas Company which we had here the other day.

At this time an adjournment was taken until 1:30 P. M.

2550 1:30 P. M., FRIDAY, *August* 18, 1911.

WILLIAM D. MARKS continued on cross-examination by N. T. Guernsey, testified as follows:

Q. Referring to this holder in this holder the lift is made of what, steel?
A. Probably not. Probably of wrought iron. It is 34 years old.
Q. And the tank is made of brick?
A. Yes, sir.

Q. Is that an underground tank or not?
A. Yes, most of it. I noticed one thing the rim stuck up a little higher than usual above the ground.
Q. You have depreciated it here seventy per cent haven't you?
A. Yes, sir.
Q. So far as the physical condition of the holder itself is concerned the holder is all right isn't it?
A. No.
Q. What is wrong about it?
A. It is 28 years old and it *it* is my opinion that it will not be safe after it reaches forty years of age.

Mr. GUERNSEY: I move to strike the latter part of the answer out as not responsive.

Q. Now what is there in the present physical condition of this holder tha- is not good?
A. Do you mean I should specify flaws and defects *Q*erceived in it in particular?
A. I want to know whether as far as physical structure is concerned it is in good condition, if not what is wrong with it.
A. It is another case of the old man, it is doing its work
2551 well enoug- but it won't last much longer.
Q. Now you think that the wrought iron is about done?
A. It will be done in about 40 years.
Q. You don't mean that exactly do you?
A. Forty years after the time it was put in.
Q. How many years from the present time?
A. Twelve years more I think.
Q. Are there evidences that you have been able to perceive of deterioration in this wrought iron?
A. It is covered with tar partly used I think as paint and partly brought up in going up and down. There is another conviction that makes me more confident as to 40 years limiting its life and that is the fact that where you use it as a relief holder you are continually running it up and down. It is not like a storage holder which in a quiet way goes up and then goes down slowly but is a holder which goes up and down a good many feet a good many times in a day.
Q. Now going back t- the question again what if any evidences of deterioration in the wrought iron did you observe?
A. Nothing exceot the general appearance that I spoke to you of.
Q. You mean it was painted and had tar on it?
A. Didn't look clean and fresh and in good shape.
Q. Now what was there aside from the paint and tar that indicated depreciation?
A. I had ni opportunity to do anything more than form a general opinion in regard to it.
Q. That means I suppose you did not observe anything that did indicate deteri*roat*tion don't it?
A. If I had not known its age, being perfectly frank with you about the matter I would not have looked after it as sharply as
2552 I did, and I would not have depreciated—I may say if you

wish me to put it another way that I depreciated it on its age rather than on clos- inspection which I might make.

Q. How much money will it cost to replace this holder itself?

A. You mean just the iron tank.

Q. Yes. The brick work has not depreciated very seriously has it nor the excavation nor foundation?

A. I should think it would cost about half as much as the structural cost, about fifteen or sixteen thousand dollars to put a new tank in, but I don't think any engineer would ever be talked into putting a new holder in the tank.

Mr. GUERNSEY: I move to strike out what he thinks about what an engineer would do as not responsive.

Q. Getting at half, you mean half of what, half of thirty thousand?

A. Half of thirty thousand, yes.

Q. How much does that lift weigh?

A. I don't know, because I don't know the amount of water it throws as they call it.

Q. What is the size of it?

A. Of the holder?

Q. Yes? I don't mean in cubic feet, but what is the diameter of it and height of it.

A. I think it is on the blue print.

Q. Well pass that for the present. I see I have here that this throws five inches. Now can you tell us about what the weight would be?

A. That was not furnished to me at the time.

Q. No, I have furnished it now.

A. Are there counter weights on it.

Q. I think not.

A. The weight of the holder, that is the weight of the iron
2553 in the holder is measured by the depth of water or weight of the depth of water which it displaces you know and it would be the weight of the depth of water—if it measure five inches, about five inches deep a disc is about the diameter of the tank I presume knowing what the holder is at the bottom, whatever it might be.

Q. Just figure the weight for us there.

A. The weight of the water?

Q. Weight of the holder?

A. You say no counter weights on it.

Q. No counter weights and throws five inches.

A. Displaces five inches you say.

Q. Yes.

A. Will you give me the diameter. In what position does it throw five inches when it is full up at the top?

Q. Yes. 80 feet is the diameter.

A. The area of a circle is equal to pi into the square of the radius and the radius is 40 feet and the square of that is 1,600 feet and pi is taken in this case only roughly about 22 sevenths so I divide by seven and multopky by 22 and that gives me 5,060

and you tell me that the thickness of the displaced water is 5/12 of a foot, about a half foot, but call it 5/12 and that if my figures are correct gives me about 2,110 cubic feet of water displaced and fresh *a*ater weighs about 62 and a half pounds to the cubic foot and multip*k*ying about 62 and a half pounds to the c*i*bic foot you get 131,875 pounds, that is if my figures are correct, they are made hastily.

Q. So that you figure this wrought iron costs something over ten cents if you make it $15,000.

A. No, I beg your pardon I simply; use them accepting the statement made to me with regard to this holder and I have told
2554 you if these statements are correct that this disc of water will roughly weigh 131,875 pounds.

Q. Well is that the way you ascertain the weight of the lift?

A. If correct that would probably be near the weight of the lift, as it is I tell you it is rough rapid calculation.

Q. I don't mean the accuracy of the figures, I think they are approximately correct, I was simply talking of the method?

A. The method is a recognized method of obtaining weight, it is the method of specific gravity displacement of water.

Q. You said that lift would cost about half of the 30,000 dollars in your judgment?

A. In round figures, yes.

Q. So that if this estimate as to the throw there is correct you have estimated that wrought iron something over ten cents a pound.

A. Ten cents a pound in the old days when it was built.

Q. Is that your notion as to a fair price for wro-ght iron in place?

A. It is not simply fair, used for different wrought iron work in the old days when it was built.

Q. Now then how much will the lift of the million foot holder weigh?

A. I don't know.

Q. How much would that holder be worth at ten cents a pound on the lift?

A. I have not figured that way.

Q. Can you figure it?

A. I can figure the weight of water for you if you give it to me, but I decline to go any further without careful consideration and thought to go further than to act as your computer.

Q. How much excavati-n does this relief holder require?

A. I didn't figure it.

Q. How deep is the excavation?

A. I didn't figure it.

2555 Q. Well don't you know anything about it?

A. Yes, I know the average value about 175 dollars per thousand cubic feet.

Q. You mean excavation?

A. No, the holder.

Q. That was what we were talking about, excavation. Don't you know anything about the depth of the *depth of the* excavation there?

A. I didn't figure it, didn't examine it.

Q. Do you know whether 30 feet?

A. I didn't examine it.
Q. Can you tell us whether 40 feet?

Mr. Byers: I submit when the witness says he has not examined it, what is the use asking further?

Q. This is a two lift holder or one lift holder?
A. Two lift holder.
Q. What are the heights of the lifts?
A. I didn't examine them.
Q. Have you any opinion on that *w*uestion, can you tell us about what the — would be?
A. I tell you I confined myself entirely to the cibic contents and let it go at that.
Q. Your general information is not such you could give us approximately what the height of the two lifts would be?
A. It is not.
Q. Now what would the foundation cost, did you estimate that at all?
A. I meant what I said, I toold you I took it as a whole.
Q. To go back if at the end of a dozen years or at the end of 20 years it should develop that this lift was no longer fit for use another one could be put in its place couldn't it?
A. Yes, sir.

Q. And that would not have to be put up at the cost of
2556 wrought iron thirty years ago?
A. No.

Q. And then whatever there is in this structure aside from the lift would be available for use after the time that this lift becomes unusable if that should happen in the near future?
A. Well do you mean that in a technical engineering sense or do you mean it just as a bald statement of a layman's ideas?
Q. Well if I knew what you meant I would tell you?
A. For a bald statement I will answer you yes if you will make a bald statement of a layman's idea for instance not an educated man not a gas man or some of these alleged engineers that you have around the country.
Q. Now then I wish you would be a little more specific. Speaking for yourself and not for the alleged engineers in your opinion would this structure, aside from the lift be useful if it became necessary to renew this lift within five or ten years?
A. You mean would I renwew it and repair the holder within five or ten years if it gave out?
Q. No. I asked you whether this would be useful what remained after the lift was gone if the lift should go within five or ten years?
A. Yes, as a car well it would be quite useful.
Q. You think it would be worth while to repair a holder assuming that it would not cost $15,000 but cost about six or seven?
A. That is a knotty question in one—you see I give the United Gas Improvement Company credit for doing business in a large way. Unless forced by necessity I don't think a concern would replace that holder after it once gave out. They are so much cheaper and better to build larger holders.

Q. This is used for what purpose? As a relief holder?
A. As a relief holder.
Q. And up to what capacity of a plant, what maximum
2557 day would it be adequate for that purpose?
A. That is very difficult to say, but it is none too big for what you are doing today.
Q. If the maximum day were doubled it would be adequate for relief holder purposes wouldn't it?
A. Have you watched it? I don't think if it was doubled it would be adequate.
Q. What determines whether or not a relief holder is of adequate capacity?
A. The amount of movement, the rough usage that it gets from being driven up and down as for instance the one there is continually being driven up and down now.
Q. Now can you imagine any relief holder that will not be driven up and down whatever its capacity?
A. To the extent that that is being driven up and down it seems to me it ought not to be used although every relief holder has to go up and down.
Q. A relief holder goes up when you're making gas?
A. Yes, sir.
Q. It goes down as soon as you stop?
A. Yes, sir.
Q. Goes up when you begin again?
A. Yes, sir.
Q. At what intervals do they make gas and stop?
A. I didn't time them.
Q. No, but you know from general knowledge don't you?
A. I should say if they are running right along that holder would move every fifteen minutes on an average the day through.
Q. That would be true whatever the size of the holder.
A. Yes, but not to the same extent.
2558 Q. If it were larger it would not move quite so far?
A. That is it.
Q. If smaller, it would move a little farther?
A. That is it.
Q. A holder is built to move up and down isn't it?
A. Slowly, yes.
Q. Will you say the holder will not be adequate as a relief holder up to a maximum day of five million cubic feet?
A. In my opinion it would be too small although it could be used and probably would be used by a concern a little short of funds.
Q. You- heavy depreciation here is predicated not on physical deterioration, but upon your theory that a larger relief holder would not move so far each time?
A. Not at all. It is predicated on such general information as I was able to gain as to the point at which a holder one of the old fashioned kind would become unsafe, not even broken down but unsafe, regarded as unsafe by gas engineers and that was forty years.

Q. Do you know of any holder that has ever been abandoned because it was unsafe?

A. There is a very large fine one in the old style in Cleveland that has been abandoned for two or three years now simply because re-g-ded unsafe.

Q. How large a holder is it. Give us approximately, I don't care for it exactly.

A. I find upon looking over my list of the People's Gas Light Company in Cleveland that I put in only the holders which were in use leaving out in valuation any statement as to the contents of an abandoned holder so that I cannot give it to you. I can't recall it without going further back into my detailed papers from which the report was prepared.

Q. Can give us nothing whatever as to the size of it?

2559 A. I should think just recalling it that it was about a couple of times anyhow as large as the relief holder which you have here.

Q. How long had it been built before it was abandoned?

A. About forty years.

Q. And what was the reason for its abandonment. What part of it developed an unsafe condition or was it simply like the one horse shay, general?

A. No, when I inquired for the reason for the abandonment the reply of the engineer in charge was that it was unsafe.

Q. Can you give me his name?

A. I can give you his first name, everybody called him Charley, he was a son of the principal stockholder, I think it was Beardsley. If not Mr. Beardsley can tell you who the man is.

Q. Was it abandoned about the time they began using natural gas in Cleveland?

A. I don't know. I simply asked why it was abandoned and the reply was that it was unsafe and they had abandoned it. I went no further.

Q. Do you know of any instance where a holder has been ab*d*n-doned on account of the deterioration in the lefts?

A. Unless you shoose to take this case and the case of a little gas holder, Inwood, New York City, Manhattan. I never knew what was the matter with that. It was abandoned too.

Q. Those are the only two cases you know of of the abandonment of holders?

A. The only cases I recall at present.

Q. And on the strength of that you depreciate us here seventy per cent?

A. Oh no. On the general information which I had from men whose opinion I respected as gas men that forty years was a good life for a holder.

2560 Q. Now the next holder here is the three hundred thousand foot holder. What difference is there in the construction of this holder and the other one we have just referred to?

A. It is of the same general type with a tank under ground.

Q. Wrought iron lifts?

A. I don't know whether they are wrought iron or steel lifts in that case.

Q. And you put that at $150 a thousand?

A. Yes, by way of an outside value expecting to give you ever-advantage of price I did so.

Q. Didn't you do it because you thought it was right?

A. Because I thought it was right to be sure not to do your company any injustice and if I made any error to make it in your favor straight through.

Q. What I want to get at is whether you have taken your estimates on some broad philanthropic charitable basis or based on what you thought was right?

A. I was trying to get at the truth and give you something to come and go on.

Q. What makes the difference of $25.00 a thousand feet between this holder and the one preceding it No. 18?

A. The skin of a holder and the skin of the tank do not increase with its cubic contents.

Q. In other words the larger the holder the less per thousand.

A. Yes, sir.

Q. Did you find in this holder anything you could see indicative of deterioration or decay?

A. Nothing except the ordinary decrepitude that comes with age and I gave it a life of forty years and an annual depreciation of two and one half per cent.

2561 Q. Now the million one hundred and thirty two thousand foot holder you put in at $100 per thousand?

Q. Do you think we would be warranting in figuring this there at ten cents plus a pound if we were trying to itemize the various factors that go into the cost of it?

A. It is a question that I have not take- up. I should have to to have some time to form an opinion as to the price that ought to be put on that work——

Q. How did you get at your value that you put on this holder No. 19 did you take the New York prices for that and simply follow them?

A. Do you mean the 300,000?

Q. Yes.

A. Yes, I took the averages of the old holders of New York. You see it is an old style holder.

Q. How did you get at your $100 on No. 20, the same way?

A. I had seen a number of estimates and a number of bids on the large new type or steel tank holder of such forms and those would run all the way from $75 to $85 a thousand cubic feet capacity, as you get up beyond a million or more than a million running donw as the capacity went up. This holder itself, the one now here in Des Moines is not only of most modern workmanship, but in addition to that has an excellent piece of brick work enclosing it. It seems to be true in every way I assume from the way in which it stood that its foundations were excellent and I felt that you ought to have credit for what appeared to be extra pains taken and so instead of taking about $85.00 or something of that sort plus foundation I

estimated it a round hundred dollars and computed it on that basis and then added overhead charges at 12 and one half per
2562 cent making the total price or structural cost of $1,127,350.

Q. These large holders in New York you have talked about were five and ten million capacity.

A. No, I have not talked about anything but one fifteen million capacity at Astoria, I spoke of five million capacity as showing what we are getting now in New York, as a starting point.

Q. What was the capacity of these holders in New York where you got your eighty and ninety figures if I remember them correctly?

A. You mean seventy five dollars to eighty five dollars. One to two million cubic feet capacity of holders?

Q. Built by what company?

A. If I could recall it, I would, I think it is a Baltimore company and the *ie* engineer at that time was a man by the name of Myer.

Q. What gas company?

A. Built for the consolidated gas company.

Q. Within how many years.

A. Well certainly within the last eight or ten years. This holder here is more finished than most of theirs.

Q. How did you get at the structural cost of your oil tanks?

A. Will you mention the page?

Q. Page 38 of your report?

A. And the section please. There are a series of them.

Q. You used the same method for all didn't you?

A. No, I did not.

Q. Take the first one, what method did you adopt in estimating the value of oil tank 21?

A. Fixing the price of brick work at I think $18.00 and the cost of your wrought iron work at about five cents, and turning the blue prints and your inventory list over to my assistants, I requested them to give me the result of their computations
2563 which they did in this case and oil tank 21 the contract price for that in position was returned to me $4,180 and checked by figuring the structural cost about 33 cents per cubic foot.

Q. Is the wrought iron in one of these lists worth twice as much as it is in the tank?

A. I never said so.

Q. Who were the assistants that made these figures?

A. Mr. Dobson or Mr. Hasek and I think both of them, one checking the other.

Q. I don't care which one it was. Now this oil tank is steel in brick, is there anything about that structure that is not either steel, brick or cement?

A. Is it submerged top?

Q. The same tank you have been estimating.

A. Tank submerged head type. I don't know whether the head has any supports inside the tank or not or whether the head is suppo-ed to support itself.

Q. I think this is it in Exhibit 16, you can look at the plan and perhaps answer your question better than I can.

A. No. 21 capacity 100,000 gallons. It appears to be of cement and iron and brick and as computed.

Q. You think that would deteriorate 20 per cent in eight years.

A. No, I think it would be out of use in forty years though, and you have got to prepare for it.

Q. What would prevent its use in forty years?

A. If Des Moines continues growing as it is growing you will find it very much in the way won't be large enough.

Q. Need more tanks wouldn't we?

A. Yes, sir.

Q. Now take the next tank, what was your method that

2564 was taken there to get at the value?

A. All of these tanks were computed by assistants and computed in the same way, there were unit values to brick work unit value of concrete and unit value of a pound of iron.

Q. Your brick work was $18 was it not, each one of them?

A. Brick work $18, concrete $7.00 a cubic yard, back filling 15 cents, excavating 50 cents including sheathing, iron work five cents per pound.

Q. Those were the figures you gave them and they *they* made the computation?

A. They made the computations.

Q. You got these figures I think you testified as to excavation and perhaps several of the other matters from Mr. Dobson?

A. No, I would like to make that very clear. I asked Mr. Dobson, I asked Mr. Hasek, I asked Mr. King, I took occasion to ask the contractor on the bridge here, Mr. Wheeler whose name I can rarely recall, and I asked several other people who I thought kn-w about these prices making note of it every time. My active assistants in this were Mr. Dobson in particular and Mr. Hasek in general. In every case I have taken whatever was suggested to me o- brought to me, considered it looked it over, and just as your engineers or any engineers would have to do further advised myself as well as I could as to local prices by any inquiries or lists I could make and when I had gotten to what I believed to be a liberal fair valuation of any unit I fixed this and I gave it to my assistants and they did the computation. I have forgot to mention that my assistants also have an adding machine by somebody in the place which I presume ought to be mentioned.

Q. Isn't it a little curious when you work out these two

2565 tanks you find the smaller cost a little less per cubic foot than the larger ones when about 50 per cent larger?

A. Referring to what?

A. These two tanks we have been talking about.

Q. Being which ones?

Q. Tank 21 and tank 22 section 47 and section 48.

A. If you will go into details of this you will find that the emplacement and excavation for these tanks are quite costly and that

therefore the iron work in each of these tanks is relatively not a small factor, but not a great factor.

Q. About how much is the iron work in the brick tank?

A. You are referring to which one?

Q. The larger one?

A. Give me the number if you please.

Q. 21.

A. 36,800 pounds of iron at five cents, $1,840.

Q. How much was the iron in the other one?

A. What tank, what number?

Q. 22.

A. 24,700 pounds of iron at five cents, $1,235.

Q. You explained the fact that the price per cubic foot in the small tank is just under what it was in the l-rger tank by the difference in the amount of iron used in the two tanks.

A. I did not generalize, these are figures that were turned in.

Q. If that was not the reason what is the reason for it? Naturally you expect as the quantity is larger the price per cubic foot is smaller don't you?

A. I can work it out if you like.

Q. I don't want to spend much time on it. If you can't
2566 tell me without working it out we will let it go. Now I see you have got steel tar tank here in section 49 that you have depreciated 47 and a half per cent. Is that on account of any physical deterioration in the steel tank or the brick emplacement?

A. It is a question of probably life, forty years.

Q. As far as the physical condition of the tank goes it is in as good shape today as it was when built isn't it?

A. No, of course you know I *put* very little time to look over these works. I have been obliged to go over them rapidly. It looked about the worst in the lot.

Q. Now what was there about it looked badly?

A. Its general appearance.

Q. Did you get at this, that is did you have your assistants work this out as they worked out this other matter?

A. Yes, sir.

Q. And the same thing with the tar separator?

A. Yes, sir.

Q. The same thing with the oil tanks in 1907 and 1910?

A. You mean oil tanks 24 and 25?

Q. Yes.

A. Yes, sir.

Q. This plate No. 28 shows these two oil tanks 24 and 25, doesn't it?

A. Yes, sir.

Q. Now you charged us off for three years seven and a half depreciation on No. 24, don't you?

A. Yes, sir.

Q. And there is nothing to it but steel, brick and concrete is there?

A. That is it.

COURT: What is the life you give to them?
2567 A. Forty years probable useful life.
Q. What life do you give to the ordinary frame dwelling?
A. I will have to refer you to Mr. Summers.
Q. What life do you give to the ordinary brick building?
A. The ordinary brick building according to the Summers' system in bad condition has depreciated seventy five per cent at the end of 50 years. It is impossible of course to generalize because you know perfectly well that in the old country——
COURT: That would make the life of the building then depreciate seventy five per cent in fifty years, be about 62 and a half years life?
A. Something of that sort if you could live in a building when it don't exist, a building three fourths gone in fifty years.
COURT: So you explain this way it is the life of the steel tank and brick here.
A. I am speaking of the useful life not of any question of what might be or what we might possibly agree might be the utmost life.
COURT: Is there anything about the oil that would injur- them or affect the steel?
A. On the contrary it would preserve it. It is one of the best preservatives.
COURT: Anything about the exposure there to affect them there on the outside?
A. The action of the weather would rust and injure them. The collection of water possibly on the inside of the emplacement would rust and injure them particularly the bottom underneath the tank.
Q. Are the tanks painted?
A. Not the bottom underneath.
2568 Q. What do you mean by the bottom underneath, the part that is underground?
A. The part that constitutes the bottom of the tub.
Q. You mean the part that is not exposed to the weather?
A. Yes, sir.
Q. Painted before it is put in there isn't it?
A. Usually set in dry cement.
Q. Steel is supposed to last a good while in cement isn't it?
A. Yes, sir.
Q. Otherwise reinforced concrete buildings would not be much good.
A. None of them are sure about them yet. I asked that question of distinguished architects who were building them and their answer is that they will be dead before the building falls down anyhow so they are not interested.

COURT: By actual observation the life of a steel building is unknown?
A. It is unknown.
COURT: That is largely true of these steel tanks isn't it?
A. I think so.
Q. I notice here in section 55 you have lumped off the works yard apparently, is that right?
A. Using the unit values which I gave you a short time ago my

assistants have computed every detail of the yard and then put it altogether. There has been no jumping at conclusions in that.

Q. Can you tell what in the inventory is included under your heading works yard in section 55?

A. Referring to the inventory page 158 well, valve boxes, tar separators, etc., erected at various times covering a period of thirty four years.

2569 Q. You mean the items detailed in the next two pages, 159 and 160?

A. 159 and 160. You wish me to go into details?

Q. No, I don't care to. I notice something here on page 46, you say as company's attendants appeared to be directed to answer no questions merely pointed out the objects, it was impossible to learn anything regarding buried pipes from inspection. How did the silence of the company's attendants affect what you might learn by inspection?

A. Your point is well taken. That was improper use of the English language. May I add by way of explanation that as the attendants appeared prevented from saying anything I went to Mr. Haines and told Mr. Haines I should like to have somebody who would explain these matters to me and he said he would authorize me to use laborers to dig up anything I wanted to in the yard, laborers, of course being at the city's expense, but I did nor do so because of the fact that it was an interminable job and my time was limited.

Q. Mr. Haines also told you in that connection didn't he that he refrained from attempting to influence you there because he wanted your estimate to be entirely without any influence emanating from the company?

A. He may have said something of that sort, but I don't recall it.

Q. Now I want to turn to Section 75, page 53, you say that in the distribution system that is the street mains and services you have not used your 12 and a half per cent as overhead, but have added 26 and a half per cent to the cost of raw material and productive labor.

A. Yes, sir.

2570 Q. By that you mean the cost of the pipes, the fittings, and valves, the material you use for making joints, drip pots and all the other material that goes into a completed main, is that right?

A. That was the fact of the matter.

Q. That is what you mean by your raw material?

A. Yes, sir.

Q. And productive labor, what special significance do you give the word productive there?

A. Meaning by that not including all of the salaries of the officials of the company which are charged to operating expenses and the cost of gas?

Q. Simply the salaries or wages of the people who are directly and solely engaged in the work of laying the mains?

A. And their foreman.

Q. I suppose the foreman would be devoting his entire time to it too.

A. Yes, he would stay right on the ditch.

Q. Now you took here as I understand it the figures that were shown on the blue print, the Buffalo blue print that you produced on your direct examination?

A. Yes, approximately.

Q. Well what does approximately mean?

A. As near as I could get at it.

Q. Couldn't you get at it exactly, for instance turning over to page 57 of your report, you have cast iron pipe three inches, I suppose that means three inches and under?

A. No, just three inch size that is all.

Q. There was nothing under that then?

A. Nothing was given me as being under that.

Q. The reason I asked that was that my recollection is that in the inventory it is inventoried as three inches or two and a half inches or under, something like that.

2571 A. If you look again you will see at the time wrought iron two and one half inches.

Q. I see, depreciation 33 per cent.

A. Yes, sir.

Q. Going back, you took up three inch pipe, you had the number of feet and you took a specific number of centes per foot?

A. Yes, 36 cents.

Q. And that is what your Buffalo plat shows?

A. Yes, sir.

Q. And you did that in the same way all the way down didn't you?

A. Yes, sir.

COURT: That included pipe and laying both or just pipe?

A. These figures include all and every expense of laying pipe digging ditch, buying iron, making joints, filling in and everything but putting a pavement over the pipes afterwards, 36 cents per foot for three inch pipe.

Q. And it not only includes that every expense, but it is 126 and a half per cent of that every expense as you compute it. In other words this 36 cents is 26 and a half per cent added to the original cost figures as you made them.

A. This 36 cents per foot is what in Buffalo three inch cast iron pipe cost taking into consideration all the records given me by the city of Buffalo worked out to be, but if you were to take the cost of the pipe and the cost of labor as you naturally estimated it without having all the troubles that arise from running into street railways, running up against sewer inlets, bad weather interrupting you, poor soil, occasional ledges of rock and things that could not be anticipated and would not be anticipated by any engineer purely as a matter of preliminary estimate, then if you sit down

2572 and figure it that way, then I would have to add 26 and a half per cent to what he got to equal what acrually happened in the city of Buffalo.

Q. You state here, and I want to get at this so there won't be any misunderstanding between us, you say on page 53 the system of over-

head charges heretofore used at 12 and a half per cent is changed to an addition of ten per cent for undistributed expense and fifteen per cent for contractor's profit making a total of 26 and a half per cent added to the cost of raw material and productive labor.

A. Yes, sir.

Q. Now that 36 cents that we referred to a moment ago for three inch pipe is the cost of the raw material and productive labor plus this 26 and a half per cent is it not?

A. That is it, yes,

Q. And that 26 and a half per cent is figured on pipe and every other article of raw material that goes in as well as upon this productive labor as you defined it heretofore?

A. No, that would not be that way for this reason. If you were asked to make a preliminary estimate in a system of mains you realize at once—so many miles long and you undertake to estimate so many miles of it you realize at once you could not go into details by any possibility as to the extra expenses, you cou- simply figure the length of pipe in that system, number of feet and probable cost of the ditching for it and then getting that in straight pipe you would have to add ten per cent undistributed charges and fifteen per cent which would cover one of two things: either the contractor's profit if you had the advantage of laying a very large amount of mains at one time or the expenditure for idle men and preparation for short jobs where the company itself keeps
2573 its own men on and does its own work on the installment plan as it is required. That frequently becomes necessary to keep the men on, you do not dare part with reliable men when really they are not earning their wages or are put at something at which they are not good for much.

Q. That don't make it clear to me, what I want to get at is this. whether these figures are 26 and a half per cent more than the cost of the raw material and the productive labor or not.

A. I will try to make that clear to you if you will allow me——

Q. I don't want to know why, but can you tell me whether it is added in.

A. The 26 and a half per cent over the estimate covering cost of pipe per lineal foot for any given number of miles of feet and over cost of ditch for any given number of miles or feet of that, those figures in that scale are what -ctually happened in the city of Buffalo in the five years prceding the year 1907.

Q. Then there is in these figures no addition over the actual results of the work in the city of Buffalo?

A. As a fact, yes.

Q. Then there has been nothing added in your estimate here to the actual cost or what you estimate would be the actual cost of the material and the productive labor?

A. There has been an addition of 26 and a half per cent or we will say fifteen per cent because of the fact that the work is done interruptedly and in small installments.

Q. That was added to what?

A. Added to what it could be done for in a large way with large gangs to get results, but it is mostly extra labor.

Q. Now let's see about that. Did you make any computa-
2574 tion of what it could be done for with large gangs and as consecutive work.

A. That was the reason that I sought this explanation that I did make these computations.

Q. What did you get as your figures then for the actual cost of doing it?

A. In round figures every one of these figures represents 126 and a half per cent of any estimate I would make on straight pipe or straight ditch work.

Q. These figures represent then the actual cost in Buffalo without any overh-ad added whatever.

A. They are the actual cost in Buffalo done in small ditches without any overhead added.

Q. Now your blue print that you produced on your direct examination and which has just been marked by the reporter Exhibit No. 41 says this, "Note, figures include ten per cent undistributed expense and 15 per cent contractor's profit."

A. Yes, sir.

Q. Now do the figures shown on this blue print show actual cost of doing work in Buffalo or is this note correct, and was there added to the cost ten per cent undistributed expense and fifteen per cent contractor's profit?

A. There was added to that cost as near as we could figure it from the quantities as ten per cent undistributed charges. That made $1.10. Then in addition to that there was added to it 15 per cent of $1.10 making $1.26 and a half on the original hundred per cent. Now it was found as a result of these computations based on the exact data from the city records of Buffalo that the actual facts run from this in small quantities down to about fifteen per cent lower
2575 than that in large quantities. There was a great deal of time spent on this, a month or so I think not only myself but my assistants.

Q. Mr. Dobson and Mr. Hasek?

A. At that time I had not the pleasure of knowing either of them.

Q. I understood you to testify on your direct examination that this blue print marked Exhibit 41, was made up from the records of the city of Buffalo?

A. Yes, sir.

Q. Now do I understand you to say that it was not but that you added ten and fifteen per cent to some computations or estimates which you made at Buffalo? Which is right?

A. I will give you a concrete example of it. If I was asked to lay down a hundred miles of main of a given size or of a number of given sizes I could easily figure the ditch work on it and the straight cost of the iron pipe and the straight cost of lead and open and caul-ing and of handling it. I would find out though that after figuring that that I would have to add ten per cent if I had a hundred mile job to get the cost as a contractor after I had done the best

I could, mind you I have not talked about bends, valves or anything of that sort, I was just estimating miles of pipe. If I add 15 per cent to that contractor's profit I would then get these figures shown in this blue print and I would as a contractor have a hundred miles and expect to make fifteen. But I find and you will find on examining my report elsewhere that owing to the uninterrupted way of doing work on the installment that this cost the gas company in Buffalo, the gas company in Cleveland and Mr. William Henry White for Des Moines, they have all wiped out that profit of fifteen per cent by reason of the conditions under which they are
2576 obliged to do their work with small gangs and in an interrupted way. Is that clear?

Q. No. Now let's back to earth.

Mr. BYERS: I submit that was rather an unkind remark.

Mr. GUERNSEY: If unkind and hurt the witness' feelings I will withdraw it.

Q. Now you said didn't you, this is at page 2306 of the record in this case, "Well in Buffalo I had occasion to originate a graphic system of recording cost in a gravelly or alluvial soil. For this purpose I made a very large number of computations based on the actual records of the cost of laying pipe, water pipe, in the city of Buffalo, New York." Now is that much of it correct?

A. That is correct.

Q. "The whole of it after being tabulated was reduced to a graphical form for sizes of pipe running from two inches up to sixty inches in diameter." Now the whole of it, that means the computations based on the actual records of the cost of laying pipe, water pipe in the city of Buffalo does it not?

A. Yes, sir.

Q. And is this Exhibit 41 the tabulation or blue print of the tabulation showing the graphical system to which you refer?

A. Yes, sir.

Q. Now then is this blue print made up, this Exhibit 41, is that made up from figures based upon the actual cost of laying water pipe in the city of Buffalo, New York?

A. Well in laying water pipe in Buffalo, New York——

Q. Can you answer that without explaining?

A. No, you can't answer a technical question yes or no. They got their pipe——

Q. (Question read.)

2577 A. In the case of water mains in the city of Buffalo, New York, they got their cast iron pipe under large contracts and they also contracted——

COURT: You need not explain but just the fact is this made up from the record?

A. It is made up from the records of the Buffalo City contracts for iron pipe, contracts for ditching in the streets, contracts for laying water mains and the cast iron pipe for gas is of wider weight and shown than cast iron pipe for water. Cast iron pipe for gas is usually laid in small installments, they are compelled to in gas and

only run a short distance out one street and then out another. In the case of water at least the case that we had under consideration there the work was done in much larger quantities and for longer distances and as a consequence I found that what I would figure as the cost of raw material and productive labor for gas taken a large way was less than the actual facts with regard to the smaller way of doing work used by the gas company. The consequence was that to my estimate which I would have made of the cost of laying gas mains on the basis of large and continuous work I was obliged to add not only the ten per cent that would come in in either case in undistributed charges, but also fifteen per cent in contractor's profit in difference in the way and for loss due to laying the main in small quantities by the company.

COURT: Then it is not made up of water mains?

A. There is no water main in that but all work of ditching everything done for water mains and laying cast iron gas pipes substituted.

Q. Now to get back to the question can you tell me directly and without qualifying the statement whether this Exhibit 41
2578 shows the actual cost to the city of Buffalo for the laying of water mains?

A. For the laying of gas mains to the city of Buffalo it shows the actual cost.

Q. Do you mean by that, that is predicated upon figures derived from the books of the gas company or from any other records of the gas company of the city of Buffalo?

A. Nothing except the price paid for cast iron gas pipe by the gas company of the city of Buffalo.

Q. Were those prices obtained by you from the books of the gas company in Buffalo?

A. They were not. They were obtained from the sworn return of the gas engineer of the gas company antedating the era of President Humphreys.

Q. I am not as familiar with these historical epochs as you are, about how many years ago was this?

A. This was 1907 when this happened.

Q. I know, but these prices I am talking about.

A. They were somewhere between 1900 and 1907?

Q. Are you sure that the prices contained on Exhibit 41 for cast iron pipe were obtained by you from a sworn report made by the Buffalo gas company or some officer of that company?

A. By an officer of that company, yes.

Q. Absolutely sure of that?

A. Yes, and not only that, but they are higher than the figures given by this gas engineer.

Q. What do you mean by that, did you take them from the report, the figures shown in the report or not?

A. I took this man's—the statement that was handed to me of this man's oath, this man engineer in charge of the Buffalo gas
2579 Light Company or something of that sort. He was the man who had been busy building it up, who had been with it for

years. He had disappeared then and president Humphreys was in his place. I took his figures and worked from them.

Q. Then these are not the figures he swore to as the actual cost of gas pipe to the Buffalo Gas Co.?

A. They are somewhat larger and higher.

Q. They are not his figures, however?

A. Oh no, they are my own figures selected after a great deal of study and care, a great deal of comparison, doing everything I knew how to get right and put down by myself.

Q. Now as a matter of fact in Buffalo you testified these prices were given you by R. D. Wood & Company didn't you?

A. You mean for cast iron pipe?

Q. Yes.

A. I don't recall it may be, but I don't think I did. Thank you very much for reminding me, I did have them verified by R. D. Wood & Company I know and I think some others. I know I exhausted every means at my po-er to get right.

Q. I call your attention to this which appears page 533 in the record of the Buffalo case, part of your testimony: "Q. Now I would like to have you state to the commission the pipe costs on which you have based your estimates and for the different sizes. Ans. The pipe costs per shot ton of 2000 pounds delivered on cars in Buffalo have been fixed as follows: 3 inch pipe $26.80, 4 inch pipe—I beg your pardon, 3 inch pipe $30.80" will you check these as I read them and see if they agree with the prices on the blue print—"4 inch pipe $28.80, 6 inch pipe $27.80, 8 inch pipe $27.80, 10 inch pipe $27.80, 12 inch pipe $27.30; 16 inch pipe $27.30; 20 inch
2580 pipe, $26.80; 24 inch pipe $26.80; 30 inch pipe $26.80; 36 inch pipe $26.80. Q. We haven't got any such price as that? Ans. I will stop there. Q. What is this chart you have got, where did you get these figures? Ans. These are the Wood & Co. figures for 1905. Q. And you adopted them? Ans. Yes, sir. Q. Without making an investigation of the conditions here in Buffalo like these conditions stated here? Ans. I assumed them more suitable for my use than even present prices today." Is that what you testified to in Buffalo about the source of your figures on the price of cast iron pipe as given in this chart Exhibit 41?

A. Very probably that. Of course I can't recall so far back exactly what I said in this case. But I am very glad to be reminded I had so great an authority as R. D. Wood & Co. back of my work.

Q. What do you say now whether you got the figures from a sworn statement of an officer of the Buffalo Gas Co.?

A. I did also, also got figures from a good many more besides which I can't recall but perhaps you have dug it up and may be able to direct my attention to it.

Mr. BRENNAN: That record which counsel have defendant's desire to look at the testimony in the Buffalo case from which counsel for complainant has just quoted in his cross-examination and let the record show this request has been refused.

Mr. GUERNSEY: On the ground that counsel for complainant de-

sires to make further use of this book without first turning it over to the defendant.

—. Now then is what you testified in Buffalo true or did you obtain these prices from R. D. Wood & Company as 1905 prices?

A. It must have been so if I said so. That must have
2581 been the final result of all my hunting around that I settled on these and put them in.

Q. So that these figures do not represent either the cost of pipe in Buffalo or to the city of Buffalo or Buffalo Gas Company, but represent figures given you by R. D. Wood & Co.

A. As I stated the best figures and in my judgment the most accurate figures I could obtain.

Q. Now did you testify on your direct examination in this case page 2307 this way, referring to this chart, "The cost of cast iron mains was taken from the records of the purchase of the city of Buffalo for water purposes and $1.00 a ton added to the piping used for gas purposes." Did you testify to that in this case?

A. I think that was it. Of course I don't know while you read a sentence in that way how much more comes into the context, of course you can twist it all around.

COURT: If you want to look at it you may do so.

A. This is a long ways back.

Q. This is only a few days ago, I am reading the testimony given here.

Mr. BRENNAN: I think the witness is correct there, his attention is not called to the general subject, just a sentence here and there.

Q. Well I will go back and give you the discussion beginning with the beginning of the answer. "Well in Buffalo I had occasion to originate a graphical system of recording costs in a gravelly or alluvial soil. For this purpose I made a very large number of computations based on the actual records of the cost of laying pipe, water pipe in the city of Buffalo, New York. The who-e of it after being tabulated was reduced to a graphical form for sizes of pipe running
from two inches up to sixty inches in diameter. The basis
2582 for the excavation and back filling in this ditch which was used in this place, the ditch being dug under the ordinary difficulties occurring in the streets of any city such as interference of sewer inlets, or going under street railways or going under steam railways or occasional slight difficulties from water small quantities of rock and occasional small quantities of paving and crossings that come up, in other words what might be called the rough and tumble condition of the city street work as is usually the case they kept out of the way of the more expensive pavements as far as they could. Under these conditions I have the actual practical fact of the cost of excavation and back filling in these ditches of various sizes averaging about 40 cents a cubic foot. The question then came up of the cost of the cast iron mains. This was 1907. The cost of cast iron mains was taken from the records of the purchase of the city of Buffalo for water purposes and $1.00 a ton added to the piping used for gas purposes." Now is that what you testified to on your direct exam-

ination as to the source from which you got this cost of cast iron pipe?

A. You mean direct examination here?

Q. Yes.

A. Yes, and taking pains to be exactly right all of them are not mentioned there. I had the quotations for water pipe, R. D. Wood & Co. and further had every advantage in the accounts of the city of Buffalo and also the quotations for cast iron pipe through the kindness of the director of the public works there what the cast iron pipe were gotten for and in some other cases I don't recall what it was, but finally these figures were fixed by assuming that the lighter cast iron pipe for gas would run at an average of about $1.00 a
2583 ton above the heavier for water. I think that is a fact that is practically accepted all over the country.

Q. I know it is a long way from what we are talking about. Of course we know gas mains are worth more than water mains. These same things you testified here that you obtained from the record of the city of Buffalo for water purposes, then you state on your cross-examination here you obtained them from the sworn statement of the engineer of the gas company of the city of Buffalo——

A. That was equally true.

Q. You testified in Buffalo in 1907 at the time the chart was prepared you obtained of R. D. Wood there?

A. Yes, sir. I think every word of that, every statement is equally true. I have no reason to try to conceal the truth in any way.

Q. Now I want to get back to where I started before you led me off on to this digression. I want to know whether on this chart you took the actual cost of pipe as shown by the records of the city of Buffalo and showed it graphically here or not, whether they are these costs or whether they are something else.

A. They are these figures in this tabulation shown here.

Q. This is one of Mr. Bemis' exhibits in the Buffalo case or copy of it?

A. I don't think Mr. Bemis made an exhibit of this sort.

Q. Who made it?

A. I did.

Q. In the Buffalo case?

A. I don't know about that so far back, you know I have not been able to hire anybody to look the thing up.

Q. Do you know who made this paper you refer to?

2584 A. This one?

Q. The one you have in your hand just referred to in your last answer.

A. I was always under the impression I made it.

Q. Well just let me know whether you made it or you did not.

A. Why of course I made it.

Q. Did you make this up from the books of the city of Buffalo?

A. I did not.

Q. Who did?

A. This is the result of my own opinion straight through. My results from the engineer to whom you refer at the same time my

result from what I was able to learn of R. D. Wood & Company, my result from what I was able to learn from the records of the city of Buffalo, my results from such information as I could obtain elsewhere and I think there is perhaps a dozen other directions from which I sought for information in order to do the square thing by the gas company of Buffalo as near as I could.

Q. Then this statement in your direct examination is not true is it on page 2307 of the record in this case for this purpose I made a very large number of computations based on the actual record of the cost of laying pipe, water pipe in the city of Buffalo, New York, the whole of it after being tabulated was reduced to a graphical form for sizes of pipe ran-ing from two inches up to sixty inches in diameter. Is that the statement you made in your direct examination that Exhibit 41 is a tabulation of the actual results in the city of Buffalo, is that true or not?

A. It is true and accurate, what you have said is true about various ways in which I got at it.

2585 Q. That involves that tabulation your opinion as well as these actual results that your opinion happened to coincide exactly with these results?

A. Why certainly. Did you expect me to put anything down I didn't believe in?

Q. Don't ask me questions because you might be embarrassed by the answer. Now then this chart, Exhibit 41, does show the actual results of the city of Buffalo over a period of years of laying water pipe in that city.

A. It does not.

Q. Well then I will go back to my other question, is the statement shown on page 2306 of your direct examination in this case for this purpose I made a very large number of computations based on the actual records of the cost of laying pipe, water pipe in the city of Buffalo, New York, the whole of it after being tabulated was reduced to a graphical form for sizes of pipe ranging from two inches up to 60 inches in diameter, is that true?

A. Yes, that is true.

Q. Now then is it true that this Exhibit 41 does show graphically the result of the computations based on the actual records of the cost of laying pipe at Buffalo, New York?

A. It shows that and a good deal more besides as you know from what I have told you and is an expression of my final opinion.

Q. I am asking about this one thing that I want to know. Now you say here on this Exhibit 41 figures include ten per cent undistributed expenses and 15 per cent contractor's profit. Do these figures contain anything added to the actual costs as shown by the records of the city of Buffalo, this chart Exhibit 41?

2586 A. You are getting too far back, I should have to look that up before I could answer you. Good gracious you know that is three or four years ago.

—. I recognize the fact that your memory is not trustworthy, but haven't you confidence in your statement on the plat here.

A. Indeed the utmost confidence in that blue print. You can

regard it as my opinion and my final conclusion not only with regard to Buffalo, but also Cleveland and also as a liberal statement for the city of Des Moines.

Q. And recurring to my question it says here figures include ten per cent undistributed expense and fifteen per cent contractor's profit?

A. Yes, that is correct, too.

Q. Now are these items added to the actual cost of this work in the city of Buffalo as disclosed by your examination of the records of that city covering that work?

A. That is a long ways back, three or four years, I think I explained to you that if I had made an estimate for mules of mains at certain fixed costs different from the city of Buffalo that I would have had to add to it ten per cent undistributed charges and fifteen per cent of contractor's profit. That table was gotten up for the purpose of making preliminary estimates as well. It is, however, my final opinion, my verified opinion and the facts on which I wish to stand. I don't recall all that Buffalo business three or four years ago and it would take a good deal of time to read it up.

Q. Now do you know whether the statement in your report is true where you say that the report includes ten per cent and then fifteen per cent *to* addition to the original cost, I am referring to your report, Exhibit 23.

A. Do I know that is so?

2587 Q. Yes.

A. Yes, I know it is so, I stand by it.

Q. Now then do you know whether these figures shown by Exhibit 41 show the actual cost in the city of Buffalo or show these costs plus ten per cent and 15 per cent.

A. I have used all the English language I know how to use when I say to you these are the actual cost to the city of Buffalo so reported there and further state it was more than the actual cost here in the city of Des Moines.

Q. Now then I wish you would take the matter of excavation for these ditches, what does this chart show per cubic yard or what have you taken as the basis per cubic yard.

A. 40 cents for excavation and back filling on unpaved streets per cubic yard.

Q. Is that what this chart is based on?

A. That is it.

Q. Now take off 26 and a half per cent, what would that give you?

A. Why should you take off 26 and a half per cent? You mean divide by 126 and a half per cent?

Q. I don't believe you could divide 40 cents by 126 and a half per cent. Be about 30 cents a cubic yard if you take off 26 per cent.

Q. So if you have added this 26 and a half per cent your cost of excavation here is based on thirty cents and that includes back filling and all, about thirty?

A. Yes, that includes bare cost of labor, back filling, streets without pavement. It frequently runs down to 15 cents as an actual

fact, but don't hold of course that sort of work where you can get any horse work.

2588 Q. You told us on direct examination Mr. King told you and he was a contractor who had done work in all streets in the city that his excavation for telephone conduits cost 40 cents?

A. Well that was with trials and tribulations of paved streets where I am talking about unpaved streets when you talk about 40 cents with only occasional difficulties that come in.

Q. Did that include removing and replacing paving, Mr. King's 40 cents?

A. Oh where it was outside in cheap pavement yes.

Q. Mr. King told you that?

A. I asked him that, so understood it.

Q. When did this conversation occur?

A. About a week or two ago down in the doorway of the—I forget the name of the hotel here, the place you all live in.

Q. Chamberlain?

A. Chamberlain, yes.

Q. A week or two ago, what time of the day was it?

A. It was in the night.

Q. What time of evening?

A. I don't know.

Q. Did you ever have more than one conversation with him about the matter?

A. I think two, City Solicitor Brennan introduced me to Mr. King first and I think I met him afterwards.

Q. You had two conversations with him then about the cost of excavation?

A. Yes, sir.

Q. Now how deep is a telephone conduit trench?

A. I didn't ask him.

Q. Well don't you know?

2589 A. No.

Q. Don't you know that they simply put these conduits under the pavement, go down low enough to get under the pavement and stop?

A. I don't know how deep they run down I never inquired that sort of thing. I have seen a great many of them, had a lot to do with them.

Q. But you don't know how deep they would run?

A. I don't know how deep they would run, I didn't even ask how many ducts they had in the thing, I know they go down there so they dig a shallow ditch, the 40 cents would make a deeper ditch somewhat cheaper so I didn't worry about it at all. I have been at this work for years.

Q. Yes I observe in Durham, Fostoria and St. Louis.

A. In addition to that had a part in underlaying the whole of Philadelphia, the business part of the town.

Q. How many miles of conduit did you lay there in Philadelphia?

A. I have never figured it out but a great many miles.

Q. Well two or three hundred or five or six?

A. Well that would be the way you put it. I would have to look that up too.

Q. Don't remember it?

A. Oh no.

Q. You say it was as much as ten miles?

A. I would say a good many ten miles.

Q. How deep is your trench for your gas pipe?

A. It is all laid out for you on the blue print.

Q. Can't you tell us what the cover is?

A. Well now three feet eight inches deep in the case of two inch pipe, three feet nine inches deep in the case of cast iron
2590 three inch pipe, three feet ten inches deep in the case of four inch cast iron pipe, four feet deep in the case of six inch cast iron pipe and so on going deeper as the size of the pipe grows larger.

Q. Can't you tell us what the cover is, give us a general statement by how much it is covered above, the cover.

A. What do you mean by the cover?

Q. The distance from the top of the pipe to the ground?

A. Well about three feet and a half it would be about right that way.

Q. Now then it is your idea that this shallow trench could be excavated more economically than a deeper trench?

A. Oh yes.

Q. I suppose the deeper you go the less it costs?

A. Within certain limits of three or four feet you know. It is practically straight work after you get down where you can handle your shovels and spades pretty easily.

Q. Now I want to go back to this chart again, that is something I think very interesting. Are these prices of cast iron pipes shown on this chart the prices you took for Des Moines?

A. They are.

Q. And do they include the pipe delivered where?

A. In Des Moines.

Q. F. o. b. cars in Des Moines, is that right?

A. Delivered 'long-side the railway platform or whatever you chance to call it on the cars.

Q. Are you sure that you took these prices on the pipe?

A. I had this chart and this chart is the basis of them.

Q. I want to get what some of these things cover, you have here cost oer foot for tools, etc., one line here what does the and
2591 so forth mean?

A. That includes shovels and things that they take home at night and think you are not looking.

Q. Well does it include anything except tools?

A. No.

Q. Are you sure about it?

A. I don't think so, I am not certain.

Q. Can you refer to the figures there and find out whether it does or does not?

A. No, I can't go any farther than that, too far back to recall what

the rest is, it is a very small matter. Call it all tools and leave it and so forth.

Q. Now miscellaneous per foot, what does that cover?

A. It covered practical actual expenditures brought out in the investigation of the records of pipe laying of all sorts and kinds which it is better to throw in that way than to attempt to itemize it and we did so.

Q. Could not be classified?

A. They could be classified.

Q. Give us something that illustrates what it included?

A. If I remember rightly that had something to do with street permits, in part something else. There are a great many expenditures of that sort for inspectors and street permits that you may not have to expend in a place like Des Moines, but they certainly would have to expend in a larger eastern city.

Q. Now then lead, cement, etc., for joints, the next curve covers the material used in the joints.

A. Yes, sir.

Q. Cover anything else?

A. No unless it says so.

2592 Q. Well it says lead, cement, etc., for joints and what is this, and so forth?

A. When you want to make a joint you have to put in open and then you make a clay roll and bring it around the pipe and make a gate at the top to pour the lead in, these are all little things, but they take trouble and time to get.

Q. This curve covers material of that sort?

A. Of that kind, yes.

Q. The next giver per foot for special castings, that explains itself I suppose?

A. Yes, sir.

Q. The next line is cost per thousand for carting pipe?

A. Yes, that is it. You will observe that when you get to 48 inch pipe the cost per foot for cartage becomes something terrible.

Q. Well that depends on whether you are interested on- side of it or the other. The next line is cost per foot for excavating filling city proper at 40 cents per cubic yard. Now that is excavation I suppose?

A. Excavation and filling, yes.

Q. Then you have some paving costs which follow I believe?

A. Down below concrete p-ving.

Q. I don't care to go into those at present. Now do the items that I called attention to include all of the items of cost which you have taken into account in unpaved streets?

A. The cost per foor for pipe laid witho-t pavement includes the following items. Straight pipe, special castings, lead, cement and so forth for joints, carting pipe, tools, etc., miscellaneous per foot, excavation and filling in the city proper, making a total given by the curve cost per foot for pipe laid without paving. I

2593 should say in addition to that that when I mentioned carefully the city proper in this that I did not intend to include expenses pavements, but I did intend to include difficulties with

sewers, difficulties with street railways, difficulties with steam railways, difficulties with occasional crossings, difficulties with occasional macadam in a small way, just enough to keep them out of the mud, an occasional valve and all of the various practical things that it would be difficult to fo-esee in an estimate, in fact you would not foresee it in an ordinary estimate.

Q. Did the items which you have enumerated include all of the items which go to the cost of a pipe in the ground?

A. Well yes, as far as human fallibility would permit me to give it.

Q. Now then your cost of pipe here is the pipe on the cars, which item do you include cost of unloading it and storing it, your store house expenses?

A. You don't put cast iron pipe in a sto-e house, you lay it out in the yard.

Q. Now which item will include cost unloading it and piling it out in the yard?

A. In the carting, sufficient to cower it and the miscellaneous some charges to that.

Q. And which one do you include it in?

A. Well I think I would rather let it go in the miscellaneous with a little on the carting.

Q. You didn't split that up in making this chart did you and include part of it under one head and part of it under another?

A. You must remember one thing, I began my report by stating clearly no man can be absolutely accurate in his work.

2594 Q. You didn't split up this item of expense of unloading and piling up in the yard and put part of it into miscellaneous, part of it into tools and part into cartage and that sort of thing did you?

A. No, but I just left it in the miscellaneous, where it happened to occur. Didn't always occur, sometimes hauled straight to the ditch.

Q. You left it in the miscellaneous?

A. If it happened that way.

Q. When you made this chart up you took and analyzed some figures and separated them?

A. Yes, sir.

Q. So as to get these separate items of cost didn't you?

A. Yes, all of these were not important you know.

Q. Did that just happen to be sometimes one kind of an expense and sometimes be another kind of an expense?

A. In the miscellaneous.

Q. This expense occurred in unloading and piling up your pipe in the yard?

A. I should — perfectly willing to have you put it in miscellaneous and let it go at that.

Q. Now take the chart and take six inch pipe how much would the miscellaneous amount to? Can you read it from the chart or is it necessary to refer to the figures?

A. About three cents a foot miscellaneous seems to go here on six inch pipe.

Q. And that weighs how much a foot?

A. About 500 pounds a foot in this case I think. Wait a minute, maybe I have got that wrong. About 350 pounds per foot. That would be a little less than a cent for a hundree pounds.
2595 Weight per foot is 29.2, it is per length I gave that 350 pounds.

Q. Going back further in which one of these things do you put the labor of pipe laying, I don't find it anywhere in your cost of laying pipe?

A. Lead, cement labor, etc., in joints you will find that in.

Q. But I don't see any lead, cement, and labor on joints?

A. No, labor should have been put in there.

Q. You told us a few moments ago that curve simply covered material used in making joints and nothing else?

A. Just simply a misleading question on your part which I being rather tired answered without looking at very carefully.

Q. Do you mean the question which was asked you whether that curve included anything except the curve was misleading?

A. It mislead me.

Q. You are satisfied that this labor is in that curve?

A. That is where it is, yes, on your calling my attention to it.

Q. I didn't call your attention to the fact that it was in that curve, I didn't know where it was, I thought it was funny you didn't have any here. You are sure now it was in that curve and is there?

A. It is there.

Here the further hearing was adjourned until 9:30 A. M. Monday, August 21, 1911.

2596 SATURDAY, *August* 19, 1911.

At this time, 9:30 A. M. of this day, an adjournment was taken until Monday, August 21, 9:30 A. M.

Monday Forenoon Session.

AUGUST 21, 1911—at 9:30 a. m.

Counsel for the respective parties all present.

Testimony on part of defendants resumed as follows:

WILLIAM D. MARKS, continuing his cross examination, examined by Mr. Guernsey, testified:

Q. Professor Marks, I find on page 2574 of your cross examination, referring to Exhibit 41, the blueprint chart, this: "Those figures represent then the actual cost in Buffalo without any overhead added whatever?" Answer: "They are actual cost in Buffalo done in small ditches without any overhead added." And then with reference to the same matter on page 2585: "Now then this chart, Exhibit 41, does show the actual results of the city of Buffalo over a period of years *on* laying water pipes in that city?" Answer: "It does not." I want to ask you again whether the figures which are shown on this Exhibit 41 of the cost of pipe in the ground are based or are the actual results in the city of Buffalo or not?

A. Results in what, gas or water pipe?

Q. Either.

A. They are intended to represent the actual results occurring in Buffalo with a ten per cent added for undistributed charges and fifteen per cent contractor's profit if the contract is made in a large way or if the work is done in an interrupted way the loss or the additional charge due to the trouble with holding labor and
2597 with starting and stopping work in small quantities.

Q. I don't think you understand my question. You do not claim that these figures shown on Exhibit 41 are made up from the actual results of laying gas pipe in Buffalo as shown by the books of the Gas Company, do you?

A. I do not.

Q. Now, then you do claim, do you not, that they are made up from the actual results of laying the water pipe in the city of Buffalo as shown by the books of the city?

A. By the accounts of the city.

Q. What is your distinction between books and accounts?

A. The city is more apt to let large contracts for water pipe than the gas company is to do large amounts of gas piping. The consequence was, as I remember, that some of the memoranda which are furnished us from the city inv*l*oved quite a considerable amount of water pipe laid for certain sums of money or certain rates. It was not always the charge for the labor of the city—independently bossed by the city. It was four or five years ago since I went into the matter and of course it is difficult to recall the exact details.

Q. But what I asked you was as to the distinction which you made between books and accounts; it all appears on the books of the city if it is the city's business?

A. I can't say; we had access to the books of the city; we had access to the accounts of the cost of laying water mains.

Q. On what did these accounts appear?

A. Sometimes on forms of contracts for a certain price, sometimes in *in* transcript, which transcript I simply accepted as being the same as the books.

Q. Well, then, who furnished you this information?

2598 A. The gentleman who was then director of public works. He was—the most that I recall about him is that he was a very obliging and very energetic gentleman—I cannot recall his name.

Q. Don't you remember that he was a man thoroughly competent and of very sound judgment?

A. I was so told.

Q. I inferred that had been omitted. In what shape did he furnish you this information?

A. I just related that to you as nearly as I can.

Q. That is, partly from contracts, partly what you call transcripts—what do you mean by that?

A. Pay rolls, cost of the amount of ditching done, localities and streets, all of the engineering memoranda that we wanted to get,

as well as the ultimate facts and figures as near as he could furnish them to us.

Q. And you yourself did not verify it with the books or records, whatever character they were, of the city of Buffalo?

A. I did not.

Q. Now do you know what period this memoranda covered?

A. A period of five years back from 1907 was my instruction to those who were looking up these matters for me.

Q. From January 1, 1907, or December 31, 1907—was the year 1907 included or not?

A. I think the year 1907 was not included, because in was during the year 1907 that this matter of gas came up.

Q. I was going to suggest, I see this was copyrighted March, 1907, so that the inference would be that the year 1907 was not included.

A. No.

Q. Now, would the contracts for laying of pipe in large
2599 quantities show the items making up the aggregate per foot; that is, would they show how much was on account of grading, how much on account of miscellaneous, how much on account of lead, cement, etc.?

A. You are going into details that I can not recollect for a period of four or five years.

Q. What I was going to get at was how you could get these items here from the contract; wouldn't it be very unusual to put these items into the contract?

A. Why, of course the men made their bids.

Q. And they based their bids on either so much a foot or mile, or something like that, wouldn't they?

A. They based their bids, if I remember rightly, in most cases on so much a foot—even that I cannot accurately remember.

Q. So assuming that this did not come from the contract, can you tell us where you did obtain those details that appear here on Exhibit 41?

A. There were also a number of memoranda of work done by the City's own employés at times.

Q. Is that where they originated?

A. In part at least. You must recollect one thing: that in each and every one of these quantities I trusted to no one else's judgment, obtaining such data as I could obtain, examining it carefully, I was the one to give the final decision; that is a matter I carry out in every appraisement I make, no matter how many assistants I have.

Q. Does this show then the results in Buffalo or does it show something else?

A. It shows the results in Buffalo with a liberal margin in favor of the company.

Q. Then it does not show the results in Buffalo, this chart, Exhibit 41?

2600 A. It does as near as one can show it. You must recollect I begin by saying in my report that anybody is insincere

who pretends any extreme accuracy on a large number of decimals for an appraisement.

Q. What I want to get at is whether this is an estimate or whether this is the result of analyzing and tabulating the figures which were shown by the actual work in Buffalo?

A. They are the result of analyzing and tabulating the figures shown by the work in Buffalo with the utmost care.

Q. Then it is based upon the actual figures in Buffalo?

A. I did not say so. I said taking those quantities, the results of that analysis, I used figures which were always outside, largely more in favor of the Gas Company, if I had any doubt in my mind in the fixing of the scale of prices for Buffalo.

Q. Then is this right; did you first analyze the Buffalo figures and ascertain the actual cost from the figures given there, assuming them to be correct, of laying water mains in the city of Buffalo for five years prior to 1907?

A. You are assuming a question of analysis of the water main business—I see what you are trying to get at.

Q. I am trying to find out how those were made up?

A. You are assuming I first calculated the water mains, and having calculated all that, then went back down the hill again and calculated it up on the gas main business. I used the water main business particularly if I remember rightly in the matter of excavation, to get that as accurately and as closely as I could. If I remember rightly I used it too in the matter of materials, getting that as accurately as I could. Now, mind you, I am talking just what a man can recall about it some four years after the thing oc-
2601 curred, please. You asked me a day or so ago about another matter, about where the calking came in; that labor that comes in the miscellaneous; I tried to think that matter up; that miscellaneous labor too was gotten from the water mains record. Then the weights of the pipes used, the gas mains were gotten from the Buffalo gas mains. I think that is about all I can tell you about it.

Q. We will go back to the question for a moment; what you call calking, I called it pipe laying; you told me then it was in the lead, cement, etc.

A. I thought it was at first; after looking it over I concluded it was in the miscellaneous.

Q. Now, to get back, did you ascertain the actual cost of the matters contained in Exhibit 41 from the records of the city of Buffalo for the five years preceding 1907, and did you then add to that ten per cent for undistributed expense and then an additional fifteen per cent, and does that give you the result shown in this exhibit 41?

A. In the case of some contracts I did so, being large and street work; you will note I put something in there, and I wonder since why I put it in; that was the contractor's profit, fifteen per cent.

The MASTER: You explained that before.

Q. Then this Exhibit 41 is not predicated upon actual results in the city of Buffalo, plus the percentages I have stated?

A. As near as I can*t* get at it, it is.

Q. Then I will put the question the other way. The results shown here on Exhibit 41 are the actual results shown for the five years in question for water mains in the city of Buffalo, plus ten and fifteen per cent to which reference has been made?

A. Not at all. I told you distinctly that I did not compute
2602 the water mains.

Q. Did you have any data from the books of the city of Buffalo as to the cost of laying gas mains?

A. No. The books of the Buffalo Gas Company were inaccessible.

Q. I asked you about the books of the city of Buffalo?

A. I don't recall they did anything but gas main laying in the city.

Q. Let me ask you this question over again. I will put it in another way. Does Exhibit 41 contain an addition of ten per cent and a further addition of fifteen per cent to the cost of labor and material, as you ascertained them in some way in Buffalo?

A. In large quantities it contains an addition of fifteen per cent contractor's profit, where large contracts are made, and I left it that way because I knew from practical experience that — it was done in short lengths, it would cost that much more.

The MASTER: Doesn't it contain ten per cent too?

A. The contingent ten per cent, but the ten per cent applies equally to the large contract and the small work on the contract, and the fifteen per cent was assumed contractor's profit, or adduced, whatever phrase we may adopt. That made a difference between large contracts' costs and small and interrupted work.

Q. Was this 26½ per cent computed on the cost of the pipe as well as upon the other things?

A. It was computed on the cost of everything.

Q. That includes the cost of the pipe?

A. The cast iron pipe you are referring to.

Q. It includes the cast iron pipe?

A. The cast iron pipe.

Q. Do those prices shown here include 26½ per cent or not?

A. You will see it is two thousand pounds laid down in Buffalo.

Q. So that those prices shown on Exhibit 41 do not in-
2603 clude that 26½ per cent?

A. That is the actual cash cost, real money paid by the Gas Company to the pipe people.

Q. And that 26½ per cent was added thereafter?

A. Thereafter.

Q. To the cost of the cast iron pipe?

A. And the ditching and all the other things that go into these unit prices.

Q. That go into these unit prices?

A. Not all of them; the straight pipe, without extras, bends and curves and all that sort of thing. I will make that a little clearer. The last time I was here I told you I took the straight pipe and of course straight ditching, and with this ten per cent and the con-

tractor's profit was supposed to cover irregularities difficulties and that sort of thing, making a total of 26½ per cent.

The MASTER: If I understand you correctly this chart shows simply the actual cost without the percentage added?

A. You mean ten and twenty-five per cent and fifteen per cent?

The MASTER: Yes.

A. That chart shows ten per cent and fifteen per cent added.

The MASTER:

Q. I had understood you both ways; I wanted to know which was correct.

A. I could explain it all to you in fifty words.

The MASTER: That is all

Q. Let us have the fifty words.

A. That blue print shows the result of the Buffalo computations, inclusive of ten per cent undistributed charges and fifteen per cent contractor's profit, on the assumption that the pipe is all laid we will say, in one large contract, we will say 180 miles of
2604 pipe a year. The man that gets that contract would make fifteen per cent on that at those prices. If, however, the company does, as it generally does, lays a little piping at the start and then runs a block in one street and stops there, and then picks up the work at the other end and runs two blocks on another street, and then sends its gang of men off somewhere else and runs three blocks, and changing back run another block, you will find that by the end of the year the men are wasting a lot of time getting ready for work and getting the stuff on the work, they waste time in between their jobs, and in addition to that the men themselves know perfectly well when the work is being rushed under a systematic drive that they are expected to do a little better than where they are allowed, as they are with the Gas Company, to go from small job to small job.

The MASTER: Have you added ten per cent on that account?

A. Ten per cent goes into the contract, for the large contract, and also goes into the small job. Fifteen per cent goes into the large contract for profit for the man who lays the pipe; fifteen per cent goes into the small jobs to cover interferences and delays and annoyances, and puttering around and doing a whole lot of little jobs instead of one big job.

Q. What I cannot understand is this, Professor, if this is made up from actual figures, it seems to me that you must either have taken those figures as they were, or taken those figures and added those percentages; can you explain this and make that clear to us as to whether it was made up from actual figures and if it is, did you take them as they were or did you add something to them?

A. I will say, in getting at the quantities in Buffalo a discrepancy
at once appeared, one no theory would have predicted, and
2605 that was the fact that the same number of small jobs giving a given length, the sum of the cost was always greater than one straight job of the same length. In other words, a contractor would lay a thousand feet of main, we will say, for in the neighbor-

hood of fifteen per cent less cost than the company's men would lay the same thousand feet in lengths of one hundred feet or two hundred feet or three hundred feet and so on. I don't know that I can possibly go any further. I have not a sufficient command of the English language if I am not clear now. I never will be able to be clear as to what I wish to convey.

Q. Can you tell us whether this is made up of actual figures or not?

A. I have told you repeatedly that it is.

Q. Did you take the actual costs in Buffalo during the period referred to, and add to that ten per cent and fifteen per cent on both labor and material and then tabulate them for the purpose of getting the result shown in this Exhibit 41?

A. I have endeavored to explain that repeatedly to you. If I have not made myself clear to you, I will simply have to say that I have no further command of the English language to make it clear.

Q. Can you answer that question by yes or no?

A. No, I can't and won't.

Q. Then you cannot say that you did take the actual results in the city of Buffalo during the period referred to and add to them this ten per cent and fifteen per cent and then tabulate it to get the results shown on this chart?

A. I have repeatedly endeavored to explain to you exactly how I did it.

Q. Would it be correct to answer the question I just asked you in the affirmative without qualification?

2606 A. In technical questions it is impossible to undertake the methods of a police court and answer yes or no; sometimes explanation is necessary, particularly if the witness is trying to make clear the truth of the matter.

Mr. GUERNSEY: I don't know whether that is intended as a criticism of the court or counsel.

The WITNESS: It is intended as a criticism of counsel.

Mr. BYERS: We all agree to that.

The MASTER: Did you get the costs from the contracts under which the mains were laid in the city of Buffalo, where there were contracts?

A. I did.

The MASTER: And then fifteen per cent would be included in that contract?

A. Yes.

The MASTER: In that case you took the contract price?

A. Yes.

The MASTER: Then when you come to the small jobs put up by the city it is?

A. Not by the city itself so much—yes it is the city itself, but I would want to say irregular jobs. You see, whenever you get at a thing practically and try to get at the honest facts about the matter, you are very apt to bump up against two things you can't reconcile and in this case, I could not reconcile after a very laborious com-

putation covering weeks of time, I could not reconcile the difference in prices for irregular and small jobs, and the large contracts. The question at once occurred, if it costs as much as this per foot to lay down certain size pipe and a contractor comes along and bids on it at the same price, where is the profit for the contractor. He
2607 is not working for his health you see; he is in business for money.

The MASTER: The fact is, you took the actual cost the city incurred in laying the pipe per foot?

A. Yes.

The MASTER: Did you add ten per cent to this?

A. In both cases, the ten per cent always came in.

The MASTER: You didn't add fifteen per cent on account of contractor's profit because that would be included in the contractor's price?

A. Yes.

The MASTER: But you found ten per cent in the small work?

A. Yes. That is exactly it; you stated it in another way, in a way I am very much obliged to you for stating it.

Q. Now taking your three inch pipe, what is your cost for tools?

A. You mean mains?

Q. You have certain unit costs for your three inch pipe which is 36 cents, I believe. How much does that include on account of your item of tools per foot?

A. I should judge about one cent.

Q. Can you give it to us accurately?

A. No, not nearer than that; I wouldn't get it nearer than that; I never pretend to decimal accuracy.

Q. Now, how much is miscellaneous, about?

A. One cent.

Q. Joints, lead, cement, etc.?

A. About one cent.

Q. And specials?

A. About one and one half cent.

Q. Carting?

A. That is about a cent.

2608 Q. Excavation and back filling?

A. That jumps up to about eleven cents.

Q. Now take four inch pipe, tools, how much?

A. About a cent.

Q. Your typewritten memorandum shows one and one half cent?

A. I don't know; I had so many books to carry, I didn't get that in.

Q. Refer to this copy, a part of the Buffalo Exhibit?

A. Yes, one and one half cents.

Q. This typewritten memorandum is more accurate than scaling the plat, isn't it?

A. Yes. If that is correctly typewritten it would save a good deal of time if you will accept it.

Q. I will accept it if you will?

A. Barring typographical errors.

Q. This is the memorandum you referred to Friday which is marked "Respondents' Exhibit G" in Buffalo?

A. That is intended to be correct; I think it is too.

Q. Referring to this typewritten memorandum, will you read the prices per ton in Buffalo of 2,000 pounds of the various sizes of pipe as I will give them, commencing with three inch cast iron?

A. $30.80.

Q. Four inch?

A. $28.80.

Q. Six inch?

A. $27.80.

Q. Eight inch?

A. $27.80.

Q. Ten inch?

A. $27.80.

Q. Twelve inch?

A. $27.30.

2609 Q. Sixteen inch?

A. $27.30.

Q. Twenty inch?

A. $26.80.

Q. Twenty-four inch?

A. $26.80.

Q. Those check with the same amounts on Exhibit 41?

A. Yes.

Q. Now the weight per length in pounds—they are the same in this Respondents' Exhibit G, typewritten memorandum, that they are in Exhibit 41?

A. Yes.

Q. The same way the weight per foot given in this typewritten memorandum checks with the weight per foot in Exhibit 41?

A. Yes.

Q. Now then taking the width of trench, that checks in Exhibit 41 with the typewritten memorandum?

A. It does check.

Q. And the depth of the trench given in Exhibit 41 also checks with the depth of the trench in this memorandum, does it not?

A. It checks.

Q. The cubic yards in trench per foot as given by Exhibit 41 also checks with the typewritten memorandum?

A. It does.

Q. Now, then, referring to the various items, will you give me the cost of the special casting as I read them, first take three inch pipe?

A. One and one half cents.

Q. Four inch?

A. Two and one half cents.

2610 Q. Six inch?

A. Three and one half cents.

Q. Eight inch?

A. Five cents.

Q. Ten inch?

A. Six and a half cents.
Q. Twelve inch?
A. Eight cents.
Q. Fourteen inch?
A. Not given.
Q. Sixteen inch?
A. Ten and one half cents.
Q. Twenty inch?
A. Twelve cents.
Q. Twenty-four inch?
A. Fifteen cents.
Q. Thirty inch?
A. Eighteen cents.
Q. Now will you give me the cost of lead and cement, etc., for three inch pipe?
A. One cent.
Q. Four inch?
A. Two cents.
Q. Six inch?
A. Three cents.
Q. Eight inch?
A. Four cents.
Q. Ten inch?
A. Five cents.
Q. Twelve inch?
2611 A. Six cents.
Q. Sixteen inch?
A. Nine cents.
Q. Twenty inch?
A. Twelve cents.
Q. Twenty-four inch?
A. Fourteen cents.
Q. Thirty inch?
A. Eighteen cents.
Q. Will you now give me the cost for carting for three inch pipe.
A. One cent.
Q. Four inch?
A. One cent.
Q. Six inch?
A. One and one half cent.
Q. Eigght inch?
A. Two and one half cents.
Q. Ten inch?
A. Three and one half cents.
Q. Twelve inch?
A. Four cents.
Q. Sixteen inch?
A. Six cents.
Q. Twenty inch?
A. Eight cents.
Q. Twenty-four inch?

A. Ten cents.
Q. Thirty inch?
A. Fifteen cents.
Q. Will you give me the cost of tools, etc., for the same
2612 sizes, beginnign with three inch?
A. One cent.
Q. Four inch?
A. One and one half cent.
Q. Six inch?
A. Two cents.
Q. Eight inch?
A. Two and a half cents.
Q. Ten inch?
A. Three cents.
Q. Twelve inch?
A. Three and a half cents.
Q. Sixteen inch?
A. Four and a half cents.
Q. Twenty inch?
A. Five and a half cents.
Q. Twenty-four inch?
A. Six and a half cents.
Q. Now miscellaneous, what is it for three inch?
A. One cent.
Q. Four inch?
A. Two cents.
Q. Six inch?
A. Three cents.
Q. Eight inch?
A. Three cents.
Q. Ten inch?
A. Four cents.
Q. Twelve inch?
A. Five cents.
2613 Q. Sixteen inch?
A. Seven cents.
Q. Twenty inch?
A. Eight cents.
Q. Twenty-four inch?
A. Ten cents.
Q. Thirty inches?
A. Thirteen cents.
Q. Does that cover the items aside from the excavation?
A. The total cost per foot consists of the cost of columns 5, 6, 7, 8, 9, 10 and 13.
Q. We have taken 6, 7, 8, 9, 10, haven't we?
A. Yes.
Q. Now 13, take the three inch pipe, what is the cost for installation?
A. Eleven cents.
Q. Four inch?

A. Twelve cents.
Q. Six inch?
A. Sixteen cents.
Q. Eight inch?
A. Eighteen cents.
Q. Ten inch?
A. Nineteen cents.
Q. Twelve inch?
A. Twenty-three cents.
Q. Sixteen inch?
A. Twenty-six cents.
Q. Twenty inch?
A. Thirty cents.
2614 Q. Twenty four inch?
A. Thirty-two cents.
Q. Thirty inch?
A. Forty cents.
Q. Now, take this twenty-four inch pipe, because it is an easy one to figure, that runs 200 pounds to the foot—I am giving you that correctly, am I not?
A. Yes, I remember that.
Q. Now, what would the pipe cost for a foot there without any profit added?
A. You mean on the railroad track?
Q. Yes, on the track at Buffalo; it is $26.80 a ton, and $2 is one-tenth of that or $2.68?
A. I presume; I haven't any copy here of the blue print.
Q. I am making this an independent computation anyway. Will you add to that 26½ per cent. to the $2.68?
A. If I have made the computation correctly, it is $3.39.
Q. $3.39?
A. Yes.
Q. Now, what did you estimate the cost of this pipe per foot, laid and all in Des Moines?
A. $3.60.
Q. Now, will you deduct from the $3.60 the cost of the pipe on the cars at Buffalo, plus those percentages and tell us what you have left?
A. You mean deduct from $3.60, $3.39?
Q. Yes, sir.
A. Twenty-one cents.
Q. Now, Professor, the cost of the tools, miscellaneous, lead, cement, special castings, carting and excavation for that size
2615 pipe per foot amount to 88 cents; where did you get the other 69 cents?
A. You made a mistake there; that $3.60 includes all those costs you just mentioned.
Q. I understand it does in your computation, you gave us a moment ago for tools; will you take those figures for 24 inch pipe, tools, etc., per foot, six and a half cents?
A. Yes.

Q. Miscellaneous per foot, ten cents.
A. Yes.
Q. Lead, cement, etc., fourteen cents?
A. Yes.
Q. Special casting fifteen and a half cents?
A. Yes.
Q. Carting pipe, etc., ten cents?
A. Yes.
Q. Excavating and back filling thirty-two cents?
A. Yes.
Q. Will you please foot those?
A. I want to go at that pretty slowly.
Q. I have no objection to your going at it slowly—will you foot those items for us, Professor?
A. Just a moment; I get those as follows——
Q. Pay attention to the question I asked you, to foot the various items I gave you and give me the total of the items?
A. You would be misleading——
Q. We will get to that later. I want to know the total of these items first?
A. You asked me to foot 6½, 10, 14, 15½, 10 and 32.
Q. Yes.
A. That makes 88 cents.
2616 Q. When you deduct your $3.39 which was the cost of the pipe, plus 26½ per cent from the $3.60 which you allowed here as your total cost of this pipe in the ground, you get 21 cents to cover these items that amount to 88 cents?
A. You would the way you do it; that is an error; I want to explain that.
Q. Let us do it another way——

Mr. BYERS: I think the witness ought to be allowed to explain.

Q. Will you take your $3.39 which is the cost of the pipe, plus 26½ per cent and add to it the cost of these other items for pipe of that size and tell us what the total is? The cost of the two miscellaneous, lead, cement, special casting, carting pipe and excavation and back filling which amounts to 88 cents?
A. You want me to add 88 cents to $3.39?
Q. Yes.
A. The two added together will give you $4.27.
Q. And that is the aggregate of the items taken from this Exhibit 41 and adding your 26½ per cent to one foot of pipe of this size, is it not?
A. As a computation it is; but it is not a fact; I am ready to give you the figures any moment.
Q. Now will you take the next smaller size, 20 inch pipe, and tell us what one foot of that pipe would cost according to your figures, plus 26½ per cent?
A. Do you wish me to act as your computer or tell the facts in this case?
Q. I would like to have you answer the question?

A. You wish me to add 26½ per cent to what?

Q. The 20 inch pipe is 4.2 pounds. For convenience, if you prefer, I will take that cost per foot from this Exhibit G; it will
2617 save us a little computation; that is given here 2.067 per foot in the typewritten memorandum?

A. 20 inch pipe?

Q. 20 inch pipe, yes. Will you add 26½ per cent to that?

A. That makes $2.61.

Q. Now, then, will you give me the total of the items in addition to straight pipe that as shown by Exhibit 41 go into pipe this size: they are 5½ cents for tools; 8 cents for miscellaneous; 12 cents for lead, cement, etc. per joint; 12½ special castings; 8 cents for cartage; 30 cents for excavation and back filling. The total as I have it is 76 cents?

A. 76 cents.

Q. Add that if you please to the cost of the pipe, plus 26½ per cent and that gives us what?

A. $3.37.

Q. And at what price have you computed this pipe in your estimate on page 57 of your report?

A. At the correct figures which are $2.83.

Q. $2.90?

A. I know I gave you the big end of it.

Q. I asked you what figures you computed this at in your report?

A. $2.83. I presume I gave you $2.90.

Q. Now, let us get the next one.

A. If you will allow me to state one fact, you will save a great deal of labor.

Q. All right, what is that one fact?

A. The City bought the pipe and delivered it to the contractor and paid for it and therefore the 26½ per cent don't come in on that at all.

Q. Well, you said, did you not, on Friday and today that
2618 these figures which you used here were used and allowed a profit of 26½ per cent on the pipe?

A. I don't know what profit R. D. Wood & Company made on the pipe, but the city bought the pipe, paid for it, and delivered it to the contractor, and the ten per cent and fifteen per cent comes in on what the contractor does after he gets the pipe on board cars; so you see these figures are entirely correct and with the actual facts.

Q. I don't see it yet. Well, then, tell us whether these prices of pipe shown here on Exhibit 41 are the prices of pipe f. o. b. cars at Buffalo, or whether they include 26½ per cent?

A. The exact statement is right here on the blue print, the cost per two thousand pounds in Buffalo, and the city paid for them and the contractor took them off the cars and hauled them.

Q. Does your estimate then include any 26½ per cent of the cost of the pipe?

A. It does not.

Q. You told us Friday and this morning that it did?

A. Possibly I may have done so. If I have done so it was of a statement which was an old thing, three or four years back; I might have overlooked it; in fact I didn't have the pipe in mind when you brought it up.

Q. When I asked you about the pipe?

A. As to the contractor paying for it, I mean?

Q. Now, you say in your report at page 53, when you come to the distribution system, referring to street mains and services but not attached meters system of overhead charges heretofore used at 12½ cents is changed to an addition of ten cents undistributed expense and fifteen per cent as contractors' profit, making a total of 26½ per cent added to the cost of raw material and pro-
2619 ductive labor, is that true?

A. I should have stated raw material purchased by the contractor.

Q. Did you add that 26½ per cent to the pipe?

A. No, I did not; I just told you so. I took the pipe in consonance with the actual fact that the city bought it, paid for it, delivering it on the siding, board of cars, to the contractor.

Q. On page 2569 of the record in this case a part of your cross examination you stated this: Question. "Now I want to turn to section 75, page 53, you say that in the distribution system, that is, straight mains and services you have not used your 12½ per cent overheard, but have added 26½ per cent because of raw material and productive labor"? Answer: "Yes, sir." "Q. By that you mean the cost of pipes, fittings and valves and the material you use for making joints, drip pots and all the other material that goes into a completed main, is that right? A. That was the fact of the matter. Q. That is what you mean by your raw material. A. Yes, sir." Did you so testify on your cross examination in this case?

A. If I did I made an oversight which I wish to correct at once by stating that the fact of the case is the mains in Buffalo were delivered and paid for by the city on the siding.

Q. Then you did not add anything in the way of a percentage to cover overhead on the cost of mains?

A. So far as the contractor was concerned I did so, and that explains why I used the phrase contractors' profit. You brought it out very clearly by your cross examination.

Q. Is that 26½ per cent in your price of $28.80 for four inch mains, that is the price given on Exhibit 41?

A. No; I didn't know what Wood made on it.

Q. That is the profit of the pipe seller, the manufacturer?
2620 A. Yes.

Q. We weren't talking about his profit at all?

A. No.

Q. We weren't considering his profit?

A. You just asked me if he made 26½ per cent.

Q. No, I did not.

A. I so understood you.

Q. I am talking about the profit the contractor makes who lays the mains, not about the profit of the pipe manufacturer. Now

then I want to know whether these prices $28.80 per ton for four inch pipe includes the profit which the contractor who laid the mains made on the money that he paid out for the pipe?

A. He never paid a cent for pipe. The city paid for the pipe. He had no money in cast iron pipe; it lays on the flat car on the siding; the city would not allow him to make a profit on the money they paid out.

Q. Then as a matter of fact there is no where any overhead figure on the cost of cast iron pipe in your estimate here, is that right?

A. You mean to say that this ten per cent and fifteen per cent don't come in on the cost of cast iron pipe on the siding?

Q. I want to find out whether you get it in on the cost of cast iron pipe in the job on the streets?

A. No, I did not; I called your attention to that——

Q. So it is not in anywhere on the cost of the cast iron pipe?

A. I won't say that, but it certainly is not in those figures here.

Q. And it is not in the figures shown in Exhibit 41, is it?

A. You mean the blue print?

Q. Yes.

A. It is not in there either.

2621 Q. On just what did you compute this then, the 26½ per cent; oet us see if we can get it right, or do you know?

A. To begin with, I did not add this 26½ per cent on the bare cast iron pipe as delivered on the siding. In the case of interrupted work, the results of such figures as I could get at was included in it, all except the ten per cent. By interrupted work I mean the piecemeal work done by the company, the odd jobs. In the case of the contractor where I got hold of his figures, in some cases. I could in round figures — the cost. I followed the matter up to the contractor, if he expected to and claimed and did get fifteen per cent profit on the contracts which he had taken from the city.

Q. As to the figures in Des Moines, take this $3.60 for 24 inch pipe, you have said you did not include any additional 26½ per cent in the cost of cast uron pipe, that is right, isn't it?

A. Yes.

Q. Now on what did you include the 26½ per cent in that figure of $3.60?

A. You have got that wrong end to. I took the actual figures obtained from the company's books for interrupted work, and also learned as far as I could, as I told you before, the contractor's price which happened to agree very closely, not exactly. I wish to be very distinct on that point; I do not claim entire accuracy in anything I have to say in the way of the appraisement, but near enough for all practical purposes and then investigating the matter further found the contractor claimed and did make about fifteen per cent, on what they did themselves, which was to haul the pipe, to dig the ditch, fill it in again, to lay the pipe, to put in the joints for the pipe, to handle the ugly corners and places where shecial
2622 castings came in to handle and put in the valves, and there were very few of them in Buffalo, but I took them in along

with the rest, because there were few, and not of much consequence, in comparison with the aggregate.

The MASTER: You have gone over that three or four times; answer his question; was it included at all in your calculation there on page 57, except as it is included in the Buffalo figures?

A. On page 57 are the Buffalo figures and therefore all there is included is as it was in the Buffalo figures.

The MASTER: Then you did not add the 26½ per cent at all to the Buffalo figures; I mean by the figures, as you got them there?

A. Your honor, I am sorry I seem to be stupid about this thing.

The MASTER: Here is what I want to know; you did not add anything to these Buffalo figures?

A. Not a thing.

Q. These figures just referred to are the figures the unit prices are shown on page 57 of your report?

A. Yes.

Q. You say on page 54 of your report: "Recent quotations from the Iron Age of $30 a ton for cast iron pipe confirm these basic prices which are obtained for a period of five years anterior to the year 1907." By these basic prices do you mean the prices per ton shown on Exhibit 41?

A. Yes, in a general way.

Q. What do you mean by the qualification, in a general way?

A. Recalling the quotation in the Iron Age, which is assumed to be authority.

Q. On page 54 of your report you say this, near the bottom of the page: "Recent quotation in the Iron Age of $30 a ton for
2623 cast iron pipe confirm these basic prices which are obtained for a period of five years anterior to the year 1907, and give the following prices per foot for pipe laid without pavement." Do the words "these basic prices" which you there use in your report refer to the prices per ton for cast iron pipe shown on Exhibit 41?

A. They do. In using these basic prices I am using as near as I can in my opinion come to the average structural cost of these mains at the time and when they were laid.

Q. I want to call your attention to your testimony in the Buffalo case on page 534, Vol. 1 and ask you whether you testified there with reference to this chart as follows: "Q. What is this chart got, where did you get those figures? A. Those are R. D. Wood & Company's figures for 1905. Q. And you adopted them? A. Yes. Q. Without making an investigation of the conditions that existed here in Buffalo while this commission is sitting here? A. I deemed them more suitable for my use than even present prices of today. Q. Then to clear up the subject you computed our pipe, reproduced new today, on the basis of 1905 prices? A. The prices of iron furnished—— Q. No, 1905 prices? A. I say on prices of iron furnished by R. D. Wood & Company for 1905." Did you — testify in the Buffalo case?

A. Of course it is a long ways back; that would be substantially what I think I did.

Q. You put the cost of excavation in Des Moines the same as the cost of excavation in Buffalo?

A. I did, after making proper inquiries, as any strange engineer would have to do.

Q. Did you investigate the conditions affecting the excavation in Buffalo?

2624 A. I did at that time.

Q. I want to call your attention to page 540 of your testimony in the Buffalo case and ask you whether you did not testify as follows with reference to that question: "Q. Now we have got pipe on the ground. Now how much does it cost to put in the ground, four inch pipe in the city of Buffalo? A. Will you give me that memorandum? (Mr. Babcock hands paper to witness.) The Witness: From the chart it appears to be about 12 cents per foot for excavation, back filling and the price given of $633.60 is the cost per mile. Q. How deep do you excavate? A. For four inch pipe the depth to the bottom of the trench is fixed at three feet ten inches, the width of the trench two feet and the cubic yards in a foot trench 1.29 of a yard. Q. And on what basis of price? A. About four cents per cubic yard. Q. Did you ever know of any work being done in the city of Buffalo at that price? A. No but recent work has been done at Indianapolis at thirty cents. Q. Oh, you are talking about Indianapolis then? A. No about Buffalo. Q. What locality are you talking about? A. Buffalo. Q. What knowledge have you got about Buffalo conditions which enable you to testify to prices per cubic yard of excavation? A. The general knowledge that any man of average common sense would have. Q. No knowledge about this locality, special knowledge about this locality? A. Such as results from casual observation. Q. What casual observation have you had on that subject? A. I have been looking around for three weeks here, looking at the soil about. Q. Well have you advised with any contractors about what it costs them? A. I have not; I don't need to. Q. Can you evolve this out of your inner consciousness by looking at the soil? A. Well after 34 or 35 years of experience as an engineer, and I am pretty near right on
2625 that." Did you so testify as to your investigation and information of the soil condition in Buffalo?

A. I should think that would be substantially what I would say.

Q. Did you use this chart and take these same figures for the cost of pipe laying in Minneapolis?

A. No, I did not, because a large amount of that pipe is wrought iron piping.

Q. Now did you testify or state this or this in substance in Minneapolis, at the discussion of this matter there before the city council on Thursday, December 9th, 1909: Q. The question now arises as to how to get at, not the actual cost of this system of mains for that we have not data and I doubt very much whether or now the company could give it to us if they wanted to. The more I look at things the more I doubt the record of the company being complete and adequate having been kept up all through, and I am forced to go away from Minneapolis for my cost and my price to places where figures have been either freely given and more carefully kept.

In 1907 I was employed to make a careful inventory of the plant, mains and apparatus of the Buffalo Gas Company, and recalling the characteristics of that city and its altitude, and consequently its winter temperature, I selected it for comparison as the basis for computation for Minneapolis." Did you so state at the time and place which I mentioned heretofore?

A. I think so, yes.

Q. Did you proceed: "So far as the price of cast iron pipe was concerned I was controlled by the corporation counsel of Buffalo, directing me to take an average price covering a period of five years anterioe to 1907, and which appears to me that this price would be a fair price to use in the case of the city of Minneapolis."

2626 Did you so state at the time and place mentioned?

A. You are asking an effort of memory I can't make very well. I think that is about what I would have said.

Q. Will you say you didn't say that?

A. No.

Q. Did the city council for the city of Buffalo direct you to take the average five year prices in making up this chart Exhibit 41?

A. The city council did not direct me so to do.

Q. You didn't take it, did you?

A. I did take it.

Q. An average of the five years' prices?

A. As near as I could get at it.

Q. You didn't take the price given you by R. D. Wood & Company for 1905?

A. I can't recall; I got as near a square deal for them as I knew how. Those prices you will find are about right.

Q. Now did you proceed at the time and place in Minneapolis I mentioned: "I bring this out with a good deal of confidence, gentlemen, for the following reason. It can be called a seasoned document. These had the worst that a large array of experts could do to shake it as of value. In fact it is simply the facts of the city of Buffalo system of laying mains put in the form of a diagram for easy use and actually derived from the records of the pipe departments and the water department, as far as excavation was concerned and verified in every case by computation and recomputation." Did you there refer to this chart and Exhibit 41?

A. I should say so.

Q. You say here it was verified as far as excavation was concerned as that statement was concerned?

2627 A. Yes, I stated so in a few moments here.

Q. Did you proceed at Minneapolis as foll-ws at the time and place mentioned: "I don't think any engineer for a city similar in its characteristics and altitude would vary probably in fixing the price of the various sizes of mains. Now, that being the case you will find on examining this chart for the four inch mains laid in the street without pavement that the four inch line of pipe crosses this line for street work at about fifty cents. In other words, about fifty cents a lineal foot is what it would cost to lay a cast iron main in the unpaved street in Buffalo or Minneapolis."

A. I should say that I did say that.

Q. You testified for the city in June in Jersey City in June this year, didn't you?

A. Just before I came here, I don't recall exactly.

Q. And that city was interested in a hearing with reference to taxation?

A. Yes.

Q. Now, when you gave the Jersey City conditions did you take this same chart and fix the same prices for cast iron mains in the streets?

A. Exactly.

Q. Where does the Jersey City pipe come from, where is it manufactured?

A. I did not ask them.

Q. You don't know, do you?

A. No, I couldn't say positively.

Q. How do the freight rates between Des Moines, Minneapolis and Jersey City from the nearest available place compare?

A. You will have to ask a freight agent that. I should add
2628 to that reply, of course, you all know freight rates are very elastic where contracts are concerned.

Q. We don't know that since they commenced to enforce the interstate commerce act. Now, then, in Jersey City, when you referred to those prices, instead of going to R. D. Wood & Company as the source you said this in June of this year, on the 22nd or 23rd day of June, 1911, at a hearing at the city hall in Jersey City, in the matter of the appeal of the public service electric company and public service gas company upon the assessment of the 1910 property in Jersey City: "In reaching these prices I took the price of cast iron pipe as stated for the years 1902, 1903, 1904, 1905, 1906, and 1907 on an average and as checked by the quotations from the Iron Age for May 19, 1910 with which——" That is what you gave as the source of those prices there?

A. I mentioned the Iron Age to you a few moments ago.

Q. And you proceeded, didn't you: "In addition to taking the average prices as near as I could get at it, I used the usual methods of engineers, and added ten per cent undistributed charged to the cost of material and labor and fifteen per cent contractor's profit above and on top of that."

A. Yes.

Q. Did your prices you gave there include anything added to the cost of cast iron pipe on account of this ten or fifteen per cent?

A. It did not include any profit on the cast iron pipe as brought out a few moments ago.

Q. That pipe was not bought by the city of Jersey City?

A. This was a gas company case; yes the gas companies had about the same thing.

Q. You went on and explained that this way: A trifle over 25% is customary; if a contract is not awarded to a contractor it
2629 then is to be supervised by the higher officials of the concern and very frequently their salaries would interfere with that very work and make it very costly to personally supervise it than

it would be to give it to a contractor with an average profit, who expects about 15%." Did you say that?

A. I expect so.

Q. You also produced this chart there, did you?

A. I don't recall whether I did or not.

Q. Wasn't this asked you: "What is the scale that you have there? A. That is a very carefully studied cost of laying gas mains made from the records of the city of Buffalo from 1902 to 1907."

A. If it referred to this, that is about the description of it.

Q. And didn't you proceed: "These prices and computations you have made, do they represent the market cost of the material during the years that you have mentioned from 1902 to 1910, the average cost around New York? A. Yes. Q. To which you have added these percentages you tell of? A. To which I have added the usual percentages."

A. Yes, that is right.

Q. You were asked there: "Q. Do these prices and computations represent the market cost of the material." What material was there of any consequence aside from the cast iron pipe?

A. I suppose lead and cement as well as cast iron pipe. Cast iron pipe is the controlling item.

Q. I find your lead and cement, etc., amount to 14 cents a foot on the 24 inch pipe against the $2.68 for the cast iron pipe. Did you mean to say when you were asked for the cost of the material in Jersey City, and stated that you added this percentage to it, you took these trifling, insignificant materials and excluded cast iron pipe that would cost nearly twenty times as much?

2630 A. I am very glad you brought it out. It is the contractor's profit I added to and you will find it on the blue print as a contractor's profit.

Q. What I want to get at is when they asked you whether these prices shown by this same chart were the prices for material around New York, the average from 1902 to 1910, talking now about the material, and you told them yes, and then they went on and said, to which you have added these percentages you tell of, and you answered, to which I have added the usual percentages, did you mean then that you added that percentage only to these few cents of lead and cement, etc.

A. It is not so inconsiderable as it might seem. It came also on the pay roll.

Q. Is the pay roll material; this question is limited to material, I thought?

A. I said productive labor.

Q. And did you proceed: "Q. Those prices you have made do they represent the market cost of the material during the years you have mentioned from 1902 to 1910, the average cost around New York? A. Yes." Now you knew and know now that says market cost of material?

A. Yes.

Q. Tell us again whether in response to that question you eliminated in your mind without referring to it in your answer all of the

cast iron pipe, or whether you included it in your answer and you did add this percentage to it?

A. I assumed that the company bought and paid for its cast iron pipe and turned it over to some contractor to lay, if it was a large job or else made it itself if it had a small job. Of course I did not include ten per cent profit undistributed charges, or fifteen
2631 per cent profit on the cost of the iron pipe, but merely what went to pull the contractor through.

Q. Now you have testified here that you took those prices from the Iron Age, May 19, 1910, on cast iron pipe and then did what was customary, add a dollar on account of the higher price of gas pipe, because this was water pipe.

A. No, I don't think I testified that; if you will kindly read what I did testify to there.

Q. Is there any variation between the price of gas pipe and water pipe?

A. It is usual to reckon about a dollar difference in favor of the gas pipe, as it runs lighter.

Q. Is the gas pipe higher or lower?

A. A little higher.

Q. About a dollar a ton?

A. Yes.

Q. You referred to the Iron Age of May 19, 1910?

A. Yes.

Q. Now all that says about cast iron pipe is this, isn't it, on page 1162: There were cast iron pipe, there were no large municipal lettings last week in the west but a fair line of small lettings and orders from municipalities; some business was received from the railroads for culvert piping; in Chicago four inch water pipe was quoted at $28.50. Will you tell us what you took on your chart for water pipes?

A. I didn't mean anything more than an average in that case, four inch gas pipe here is $28.80.

Q. So it is fifty cents over these figures instead of a dollar?

A. It depends a good deal on the size of the contract you let. These men all cut. The U. G. I. can get deeper cuts than
2632 anybody else.

Q. You in your testimony said you took the Iron Age figures?

A. As an average, yes.

Q. This proceeds: Water pipe four inch $28.50; six to twelve inch, $27.50; and 16 inches up $26.50, with one dollar extra for gas pipe. Did you add the dollar?

A. No, I didn't.

Q. You didn't add freight to Des Moines, did you?

A. No, it is impossible to find out what that would be.

Q. You mean to say it is impossible to find out what the freight rate is from Chicago to Des Moines?

A. It is quite impossible to find out what the real freights are in the United States in regard to the monster trusts today; the U. G. I. is in the game.

Q. Is the U. G. I. engaged in the manufacture of gas and iron piping?

A. No.

Q. You are under oath, will you give us one specific instance upon which you base that statement with reference to the U. G. I.?

A. I certainly will not withdraw it. I happen to know the highest official of that concern, Thomas Dolan, and I know if anybody in the United States gets inside figures, it is that gentleman and his associates. It is of course not in the nature of legal proof; it is simply my general knowledge of the situation.

Q. You know what you are swearing to here amounts to charging these people with a crime, with the violation of the interstate commerce act, you know that?

A. Not specifically; I am simply charging them with getting inside prices.

Q. You are charging them with getting concessions on the freight rates from the tariff rates?

2633 A. I didn't put it that way.

Q. That was the essence of it?

A. I distinctly make the statement that I am morally convinced they get less freight rate than any gas machinery ever gets.

Q. Do you say on your oath here that they get freight rates that are less than the published tariff rates?

A. I don't know what they are. I do say I am certain, as you must be that they get the best rates and lowest rates going on everything.

Q. Do you still adhere to your statement that it is impossible to ascertain the freight rates on cast iron pipe between Chicago and Des Moines?

A. For an individual, you mean like myself, making an inquiry like myself, I wouldn't believe one word they said to me in regard to freight rates, going in my individual capacity; I wasn't born last summer.

Q. So that it is impossible for you to ascertain what cast iron pipe would be worth laid down in Des Moines?

A. By mere inquiry, yes.

Q. I didn't say mere inquiry, can you ascertain what cast iron pipe is worth laid down in Des Moines?

A. That would depend on the size of the contract largely.

Q. Can you ascertain what cast iron pipe is worth laid down in Des Moines?

A. That would depend on the size of the contract.

Q. So you could or couldn't ascertain?

A. Yes, sir.

Q. Did you attempt to ascertain for the purposes of this case?

A. No, I did not.

Q. Would it surprise you if you learned that the average

2634 price paid by the company for cast iron pipe laid down in Des Moines in the last five years is over $32 a ton, and if you should learn that was a fact would that in any way affect your confidence in the correctness of your conclusions?

A. The books are the best evidence, and you have the figures of

course as to what you actually paid. I should believe what I saw in the books if they are properly kept and properly interpreted.

Q. I wish you would turn over to another page of your excluded items, page 71; you have estimated here the cost of replacing pavement, have you not, at the top of page 71, asphalt on concrete?

A. Yes.

Q. And at how much per square yard?

A. $1.85.

Q. Now, will you turn to this chart, Exhibit 41, and tell us how much you estimated it a running foot in a trench two feet wide?

A. I don't seem to find asphalt on this—$3 a square yard. Here it is given at $1.85 which is the statement of ex-City Engineer Dobson as to the actual figures which had been paid.

Q. Did he have bids on work like this, piece-meal work like this?

A. Again I don't wish to say positively in regard to that matter. I asked him about that and I think he can verify it or contradict it according to the actual facts of the case. I think he said that all repairs to the streets were to be made at the contract price so that I took it for granted that would cover patch work in the way of paving.

Q. You know that is a part of a general contract for doing all the work?

A. I knew of course it was.

Q. How did you get these costs of this asphalt work in Buffalo?

2635 A. By inquiry there, just as I would make inquiry in any city where I was not actually engaged.

Q. Did you testify in Buffalo from this same chart that the cost of asphalt paving was 97 cents on a two foot ditch per lineal foot?

Objected to on part of defendants as being irrelevant and immaterial.

A. It is so far back, I'll go over it again if you like.

Q. The difference between 97 cents and $3 is very marked?

A. A two foot ditch?

Q. One lineal foot would be two square feet?

A. Yes.

Q. And nine square feet in a yard?

A. Yes.

Q. Four and half times one lineal foot would make a square yard?

A. Well, it may be a typographical error; it is quite possible, in fact it is so far back without going over the thing again, it must be obvious to you that I cannot recall distinctly as to what I said four years ago.

Q. Will you kindly check there again and see whether it shows 97 cents, how much per lineal foot is required for asphalt on concrete?

A. Well, I don't know whether it is mentioned here or not. I think I instructed the assistant who did that for me to allow six inches extra on each side, so that instead of being for a two foot ditch, instead of the cut of asphalt being exactly two feet it would be three feet wide.

Q. Your recollection about that is distinct and specific?

A. No, I was only thinking of the custom.

Q. Take a six inch pipe or a four inch pipe and get your asphalt for a running foot from the chart of asphalt on concrete—

2636 take a four inch pipe for a two foot ditch?

A. The cost per foot for streets with brick, asphalt, block stone on concrete, the cost of a four inch pipe complete laid in the ditch without pavement is about fifty cents per lineal foot, and the cost of a four inch main complete, laid in the ditch, with pavement of asphalt or block stone on concrete, is given here as $1.45 on the chart.

Q. That would be 95 cents a foot for the asphalt or other pavement?

A. That would be 95 cents a foot, assuming it to be $3. per square yard in Buffalo, and assuming what would be usually done, a cut would be made of six inches from the side of the edge.

Q. Did you investigate to see whether the cost of laying asphalt pavement was the same in Des Moines that it was in Buffalo?

A. Yes.

Q. You found it was pretty near twice as much to lay asphalt in Buffalo as in Des Moines?

A. At the time such were the facts; that is one reason why you always have to make local inquiries.

Q. On the asphalt pavement you took Mr. Dobson's straight contract prices, that is, if a man would lay ten or a dozen blocks of asphalt in the street here?

A. Yes.

Q. You think it would cost more to do the work if you had to do it in small pieces than in large jobs?

A. I suppose so, yes.

Q. Take the next item, wood block on concrete, $3 a yard?

A. If I remember rightly, I talked with quite a number about paving in this city, and finally went over the matter with Mr. Dobson, going into the exact figures assembled from the city records.

Q. Did you get the figures from the city records here the

2637 way you did in Buffalo?

A. I did not get them, Mr. Dobson got them.

Q. Before I forget it, where in these prices for this pipe is the engineering?

A. Engineering and omission, etc.?

Q. Yes.

A. It is allowed as explained to you previously in ten per cent undistributed charges, whatever engineering is required; practically as a matter of fact all the men that superintend this street patch work have their pay charged up to the operating cost.

Q. If we were reproducing this plant it would require an engineer to lay out the system of mains?

A. I am giving you the structural cost.

Q. If we were reconstructing this plant you would have to have an engineer to lay off your system of mains?

A. It would pay in the end; it is not often done you know.

Q. It would be necessary if you were to construct this plant economically to have an engineer of practical experience lay out your system of mains and specify the size of the pipe and locate your valves, drips and everything of that kind?

A. It would pay in the end, but it is not often done.

Q. That is not just what I asked you. It would be necessary to do this if you were to construct the plant economically?

A. No, for the simple reason that it is not very frequently done.

Q. Give us one or two cases where it is not done?

A. I think Des Moines is a pretty fair sample.

Q. I want you to give me a concrete case that you know of where a system has been constructed without having an engineer lay out a system of mains.

A. I was just trying to tell you; I think Des Moines, judg-
2638 ing from the maps—

Q. You said usually they did not employ an engineer to lay out the mains; I would like to have you give us one case you know of where any work of any considerable amount was done without employing an engineer?

A. You mean, and charging their pay specially to the mains?

Q. I mean just what I say; I would like to have you give us one case you know of building a gas plant or of the building of a large addition to a gas plant where it involved the laying of a system of mains or a large addition to the system of mains, where an engineer was not employed to lay out the mains?

A. I think in almost every case a draftsman or engineer is employed, such a matter as that, but his pay is usually charged to operating expenses.

Q. You told us a few moments ago usually an engineer was not employed?

A. I meant directly and charged to the job, that is what I meant.

Q. In other words, to get back to the question I asked you at first, it is necessary to employ an engineer to pay out a system of mains if it is to be an efficient system and economically constructed?

A. You put that condition in and I agree with you, but in the majority of cases that is not so.

Q. Where in the items that make up your 36 cents for instance, 49 cents, take the four inch main, how much have you allowed in there for engineering and superintendence; where do we find it?

A. Four inch main, 49 cents, first of all I assumed in patch work of the sort done—

Q. I am talking about the item of 49 cents for this specific
2639 job?

A. There would be no specific charge against it, for the salary of the engineer who laid it out; he would be called an engineer on the works and it would be charged up to the cost of making gas; but to be on the safe side I allowed ten per cent undistributed charges, you would find it in there.

Q. Ten per cent of what?

A. On all the expenses outside of buying the cast iron mains.

Q. And did you then put 25 per cent on top of that?

A. Fifteen per cent on top of that.

Q. So that in order to get at it—see if this is right—take the 49 cents for instance, and the cost of the bare pipe is 27½ cents?

A. There is a line here called cost per foot for straight pipe not laid.

Q. That is 27½ cents, isn't it?

A. 4 inch pipe, about that.

Q. That would be 27½ cents taken from the 49; am I right?

A. 21½ cents with all the other expenses besides the main.

At this time an adjournment was taken until 1:30 p. m.

2640 1:30 P. M. MONDAY, *August* 21, 1911.

WILLIAM D. MARKS continued on cross examination by N. T. Guernsey, Esq., testified as follows:

Q. I was asking you before luncheon I think about whereabouts in this analysis of the cost of pipe in the ground that you find this engineering?

A. Pardon me, you were asking me about the difference in price between asphalt wasn't you?

Q. No, I had passed that. Before I take that up. I see you have now this typewritten memorandum from which the chart was made up which shows the various prices in figures. Will you give us the price per foot of the various sizes of cast iron pipe?

A. Under the head of straight pipe, column five.

Q. Begin with three inch?

A. Three inch, 19.2 cents, 4 inch 27½ cents. 6 inch 40½ cents; 8 inch 58 cents; 10 inch 78 cents. 12 inch 97.2 cents 16 inch, $1.48. 20 inch, 2.067; 24 inch $2.68. Do you wish to go any farther?

Q. No, I think that covers all the sizes here doesn't it?

A. Yes.

Q. Now there is no engineering in that is there?

A. No.

Q. Now is there any engineering in the special castings?

A. No. I can cut that short by telling you whatever engineering there may be there, is either in the ten per cent of the whole or in the miscellaneous per foot.

Q. Now the miscellaneous per foot amounts to——

A. That is column eleven.

Q. Ten isn't it?

2641 A. Column 11, miscellaneous per foot.

Q. What is column 10?

A. Column 10 is labor in street with macadam surface.

Q. Now your miscellaneous begins with one cent for three inch pipe don't it?

A. For two inch wrought iron pipe.

Q. I am asking about cast iron pipe?

A. Yes; three inch cast iron pipe one cent.

Q. Now go on down in sizes for that.

A. Three inch one cent; 4 inch 2 cents; 6 inch 3 cents; 8 inch 3

cents. 10 inch 4 cents; 12 inch 5 cents; 16 inch 7 cents 20 inch 8 cents; 24 inch 10 cents.

Q. Now does this miscellaneous run any fixed per centage of the whole?

A. It does not. I recall that the miscellaneous expenses is all sorts of things that could not well be classified and that it was quite irregular for the various sizes and that finally it was added up and smoothed out a little bit. In other words it was smoothed out to the extent of not bothering with anything except the nearest cent.

Q. Well take your three inch pipe the cost given here is 36 cents isn't it for the whole thing?

A. That is 36 cents.

Q. Your one cent miscellaneous is a little under 3 per cent of that?

A. Just about.

Q. It is not three per cent on the next size?

A. You are referring now to the 6 inch?

Q. No, the 4 inch.

A. That is two cents in 45 cents isn't it?

Q. 48½. Three per cent would be a cent and a half and
2642 you equalize- that and made it two cents?

A. Let me explain that the last column under the heading 27 is a double column and that my own figures finally taken by myself figures that I worked out and that there is a column alongside of it called Buffalo are the figures that I found somewhere in some paper given for Buffalo gas pipe, I think by a gas engineer of theirs.

Q. The fact is, isn't it that this plat, Exhibit 41, is what you used in the Buffalo case and that the figures you have made up and are using there are not exactly the same figures that you used in the Buffalo case?

A. Well it is a long ways back. I think you will find that I have always thrown any favor of the company.

Q. I call your attention to this paper in the volume of Exhibits in the Buffalo case, marked Respondent's Exhibit "G" and ask you whether or not that is not a copy of the figures which you used in the Buffalo case which you produced on that hearing at that time. Perhaps I can refresh your recollection about that a little. Let me read this to you and see if this refreshes your recollection, commencing at page 610 of your testimony in that case, referring to some paper "Commissioner Davies: Did you not just say Mr. Marks you did not quite understand what Mr. Babcock wanted a moment ago. A. Yes. Q. But that you did not have it here to use it? A. I did use it to make more accurate work. Commissioner Shedden: And referred to it in your testimony? A. And referred to it. Commissioner Davies: Produce it then. (Produces paper.) A. This is the original from which——Commissioner Davies: Hand it to Mr. Babcock. A. And from which the blue print chart has been made out. It contains a great deal of information in addi-
2643 tion to that—Commissioner Davies: Well you are here to give them all the information you are in possession of. Mr. Babcock: Will you check off in pencil what columns you used in

calculating your cost. Just check the vertical columns that you used in connection with your calculations, nthen we will know the basis of your computations. (Witness marks on sheet with pencil.) Q. How have you indicated it? A. By putting a ring around those columns which were used. Q. Now will that enable us with the blue print to re-compute your figures? A. If you wish. Mr. Babcock: I would like to have that marked for identification. (Paper marked Respondents Exhibit "G" for identification)." You notice the paper to which I call your attention is marked Respondent's Exhibit "G" do you not?

A. Yes, sir.

Q. Does this refresh your recollection so you can say whether or not that is the paper which you used in Buffalo and from which this chart, Exhibit 41 was made up or a copy of it?

A. It appears to contain about the same figures but rearranged when being copied. I see there is some below here, the lower part of this exhibit off to the left hand lower side I assume for the sake of room having been stuck over here on the end. I have no reason to believe it is not substantially*b* what I put in, wherever I have caught it, it seemed about right. There may be a few points that it is wrong.

Q. Then this respondent's Exhibit "G" pages 209, 210, 211, 212 and 213 of the volume of exhibits in the Buffalo case is the paper or copy of the pa-er which you produced there as the paper containing figures from which this blue print was made?

A. It appears to be a copy of this paper used there slightly rearranged, I find no difference in figures in a cursory glance
2644 over it.

Q. Referring to this Exhibit "G" column one, contains the sizes of pipe under the head "diameter of pipe?"

A. Yes, sir.

Q. Column 2, Cost per ton of 2,000 pounds in Buffalo New York?

A. Yes, sir.

Q. Three, weight per length in pounds?

A. Yes, sir.

Q. Four, weight per foot?

A. Yes, sir.

—. Five, straight pipe?

A. Yes, cost per foot for straight pipe. That is column five.

Q. Now there is here this heading at the top of the whole paper see whether you have it also in the one you are using, that is here in this respondent's Exhibit "G" "Estimated cost of laying *has* mains 1907, elaborated for use in Buffalo, N. Y.?"

A. Change that to 1906.

Q. 1906?

A. Yes, 1906. I presume it is just a typographical error.

Q. Elaborated for use in Buffalo, N. *L* Y. Figures include 15 per cent contractor's profit and ten per cent undistributed expense?

A. Yes, sir.

Q. Then getting back the 5th column is cost per foot for straight pipe.

A. I have changed this to figures include 15 per cent of laying contractor's profit.

Q. I don't care anything about what you change on that.

A. I want to see what this one is.

Q. The 5th column is cost per foot for straight pipe.

A. Yes, sir.

Q. The 6th column is cost per foot of special castings.

2645 A. Yes, per foot of straight pipe.

Q. General heading, cost per foot for, and the subhead special casting?

A. Yes, sir. That is in addition to cost of pipe.

Q. The next column 7 is unde- the same general head cost per foot and is lead pipes, cement, etc.

A. Yes, sir.

Q. Next parting pipe?

A. Yes, sir.

Q. Next tools, etc.?

A. Yes, sir.

Q. Next miscellaneous?

A. No, the next is No. 10, labor in stre-ts with macadam surface.

Q. That don't appear here. That must have been added since you furnished these Buffalo figures wasn't it?

A. I don't know about that.

Q. Now let's have that column labor in streets having macadam surface?

A. That is column 10, is what——

Q. Give us that in the 3 inch and then on down?

A. Three inch pipe ten cents, 4 inch pipe 10 cents, 6 inch pipe 12 cents, 8 inch pipe 14 cents, 10 inch pipe 14 cents, 12 inch pipe 15½ cents, 16 inch pipe 16 cents, 20 inch pipe 17 cents. 24 inch pipe 17 cents.

Q. Give us the heading of this column again please?

A. Labor in streets with macadam surface.

COURT: What does that mean, in removing macadam?

A. There were some streets as I recall it in Buffalo that were likely macadam, quite a number of them.

COURT: This is the labor for removing the macadam and

2646 digging the streets complete?

A. Through Macadam, put the macadam back, instead of through straight earth without any pav-ment there at-all.

Q. That is not the cost of the paving is it?

A. No.

Q. Nor the cost of replacing paving. You have a column there have you not stone or macadam at $1.50 a square yard.

A. I have a total cost per foot*n* for laying gas mains, streets with macadam top——

Q. No, I don't mean that. What is the column following miscellaneous Miscellaneous here is 10, you have it 11 I understand. Now what is column 12?

A. Column 12 is streets macadam top outside of city proper.

Q. And what about it?

A. There are prices given.

Q. For what?

A. For the cost of laying pipe per foot and putting pavement back.

Q. Now will you give us that column for these various sizes, 3, 4 6, 8, 10 12 16, 20 and 24?

A. Streets with macadam top outside city proper?

Q. Yes, whatever it is there your column 12?

A. Column 12, yes. Three inch cast iron pipe 46 cents. 4 inch cast iron pipe 58½ cents; 6 inch cast iron pipe 88½ cents. 8 inch cast iron pipe $1.07. 10 inch cast iron pipe $1.33. 12 inch cast iron pipe $1.62½ cents. 16 inch cast iron pipe $2.27. 20 inch cast iron pipe $3.00. 24 inch cast iron pipe $3.73.

Q. Have you a column here headed cost per foot for paving stone or macadam, $1.50 a square yard?

A. I don't find such a column here. What is the number
2647 of that column.

Q. It is No. 11 here. Macadam or stone is marked on this blue print $1.50.

A. The streets with macadam top outside of city proper run as follows, perhaps you can catch it by coincidence of figures. 3 inch, 34 cents——

Q. That don't check. This is 50, 50, 50, 58, and so on, nothing under 50 in this column 11 here.

A. I don't find it here.

Q. Now then have you cost per foot for paving brick, asphalt or block stone on concrete at $3.00 a square yard, it is column 1*w* in respondent's Exhibit "G" in the Buffalo case?

A. I have one here asphalt $3.00 a square yard, beginning at $1.00 for three and $1.00 for four.

Q. That is asphalt alone?

A. No, asphalt is not put down, not intended to be put down except on concrete base.

Q. Is asphalt the only kind of paving that column covers, you misunderstood me?

A. Yes, that is the only one it gives there.

Q. That shows $1.00 a foot for four inch pipe for asphalt instead of 95 cents scheduled here this morning?

A. No, I think this is intended——

Q. Pardon me, this column in respondent's Exhibit "G" is headed cost per foot for paving, sub head brick, asphalt, or block stone on concrete $3.00 a square yard, that would not include anything but paving?

A. No that includes nothing but paving. A three inch main is put down $1.00 here. Now if it came out 97 cents on the average of figures, figuring down by two or three computers, I think
2648 with me it would be perfectly natural for me to stick it down at $1.00 and let it go at that.

Q. Now I want to get back at your column 11, give me the heading of that again, or ten?

A. Labor in streets with macadam surface. It is evident that that was all got from some particular paper or contract that fell into my hands which showed the difference between the labor in the

street without anything on, clean dirt, and labor in the street with the coating of macadam put in.

Q. You don't mean b- tha- the excavation do you?

A. That is just exactly what I think I do mean if I could find it here. If I could find the labor. My column 22 here excavation and filling city proper 40 cents per cubic yard gives eleven cents a foot.

Q. For three inch stuff?

A. Three inch stuff and also eleven cents for four inch stuff?

Q. This gives ten cents in your macadam?

A. Yes, sir. I will tell you where that came in I think, in this I distinguish between the city proper and outside the city and it is a factor that you could theorize about but it is an undeniable fact that where there is much traffic the work goes on slower.

Q. Costs more money I have no doubt about that. Then you think this column eleven—will you read the heading of that again please?

A. Labor in street with macadam surface.

Q. That don't indicate it is outside the city?

A. No, but—when I say city proper I don't mean city limits, I mea- what they call the city, for instance in London, the *the* busy part of the city.

2649 —. I think you better leave that out, I can't place it very well -yself.

Q. Maybe I can help you. Take your column there headed labors in streets with macadam surface and your streets with macadam top outside city proper and you will find that you added——

A. Column 10, I see it now, thank you.

Q. You added your labor in streets having macadam surface to the unit price in streets that were unpaved.

A. Yes, sir.

Q. To get streets with macadam top outside of the city?

A. Yes, sir.

Q. So that ten cents does not include the trenching which you have in these unit prices does it?

A. That is right, thank you.

Q. But that is extra work on account of the macadam?

A. I presume so.

Q. Now what do you say as to whether the paper which you are using there is a copy of the paper you used in Buffalo after the comparison we have been trying to make here?

A. I was under the impression it was and I think any differences there may be, occur from some marking which was done on it which was mentioned at the time.

Q. Don't appear to be any marking here or changing?

A. No, but when I handed over a copy of this I think some were marked down by some request of counsel or commission.

Q. Was there anything aside from the indications on the columns that you took into account?

A. Quite impossible to remember four years back.

Q. Have you any objections to having that paper you are using marked and offered as an exhibit?

A. Certainly not.

2650 Q. I would like to have it marked and also like to have this exhibit in the Buffalo case marked as an Exhibit. The paper marked by the reporter, complainant's exhibit 42, is the copy of the paper which you have been using?

A. Yes, sir.

Q. The paper that is referred to as respondent's exhibit "G" in the Buffalo case is the one marked complainant's exhibit 43.

A. Yes, sir.

Q. Now to get back in which one of these items here that go to make up the total say of your 49 cents on the 4 inch pipe is the engineering?

A. Wel- I should say that 10 per cent undistributed charge contained the engineering perhaps if there was any done—of course I didn't theorize about it at all, I simply took what I found to be actually done, if there was — done at all, and some other charges such as permits and that sort of thing that come in. I at first thought miscellaneous charges contained permits but I think now the miscellaneous per foot is the caulker's gang and the pipe handlers along the edge of the ditch and something of that sort.

Q. You also said it covered the store house charges, unloading cars and that sort of thing.

A. Everything was intended in and I think the hauling and carting, you call it carting pipe here covers that.

Q. You told us it was in the miscellaneous didn't you?

A. If there was anything in the way of storing anything I could not charge to carting I probably stuck it in miscellaneous.

Q. You told us further the cost of handling pipe, what you call store house charges were in the miscellaneous didn't you?

A. If it was not in the carting.

2651 Q. Now just tell us which one of these items were taken as the basis of the computation of this ten per cent?

A. All of them.

Q. You mean by that—you don't mean straight pipe?

A. Oh no I am talking about now, about what the contractor did

Q. You don't mean special castings?

A. The contractor don't furnish special castings.

Q. The contractor furnishes lead, cement etc.?

—. He did.

Q. Cartage?

A. And the cartage.

Q. And tools?

A. And the tools.

Q. And miscellaneous?

A. And the labor, the labor is the big item.

Q. Where is that?

A. Excavation. Column 22, excavation and filling city proper 40 cents per yard.

Q. That is column 13 here. Then it is on these items that this 10 per cent is figured?

A. I think it is.

Q. And on no others?

A. Oh I won't say that.

Q. Well don't you know?

A. I could settle down and figure it all out if you wanted me to go at it. I want to say and assure you there is absolutely nothing omitted here that could in any way come in the way of expense.

Q. About what is a proper charge for pipe laying per foot or per mile or per length or per anything else on four inch pipe.

A. Do you mean for instance the total cost per foot for pipe laid? Four inch pipe is——

2652 Q. No, I don't mean that, you misunderstood me. You have some men you call caulkers you say?

A. Yes, sir.

Q. They are not men used in doing excavation?

A. No.

Q. You have some men you call pipe handlers don't you?

A. Yes, work along the ditch.

Q. What is the duty of the pipe handlers?

A. The teamster drives up along side of the ditch and the pipe ha-dler generally gets out, skids, and the teamster gets out his rope and they have a few hand spikes and the teamster lets go of the rope until it rolls down and the pipe handler- with their hand spikes generally have a tripod or a frame and when the boss caulker calls for a pipe they cling it in.

Q. Pipe handlers men as then that take the pipe from the wagons, unload it or help unload it at the ditch and then put it into the ditch?

A. Yes, with the aid of the caulkers if the caulkers are not busy.

Q. And the caulkers make the joints in the ditch and also I suppose see that the pipe is laid at the proper level and proper direction?

A. That is it.

Q. And neither of these gangs do this excavating?

A. Well that is depending on how you are working. A good handy gang and a small job you don't want many men on it for working advantageously and they will swap around, do most anything if you have got a good boss.

Q. That is not the ordinary way of laying pipe is it? What do pipe caulkers get a day?

2653 A. I don't know.

Q. What do they pay men for digging a trench a day?

A. That depends a good deal on the men, dagoes, I suppose about a dollar and a half along about there, able bodied men usually and as high as $2.00 and $2.25.

Q. Do you know what the price is the city is paying now for common labor in Des Moines?

A. I do not. I was told too, I reported it to you.

Q. You need not hunt for it. Now I want to know whereabouts in this estimate this labor performed by the caulkers and pipe handlers appears, what item?

A. Miscellaneous I told you.

Q. That also includes this ten per cent does it?
A. No. It is ten per cent of the whole business.
Q. That is spread over all the items?
A. Intended to be, yes. In other words you might say miscellaneous in a rude way is ten per cent too much.
Q. It is 110 per cent of what you base it on?
A. Of what we found.
—. What is a fair price for six inch pipe, or fair cost for six inch pipe for the labor of the caulkers and of the pipe handlers either per foot or per length or per mile or any other basis you want to take?
A. That is getting down very fine but suppose you take it miscellaneous per foot and cut a little off that if it looks big. Six inch, about three cents.
Q. Your three cents includes other matters don't it, besides this labor?
A. It is very probably too I think there was a system of inspection there or taking out permits or was there at the time, they
2654 didn't amount to much, but had to be gotten in somewhere, I think that went in.
Q. Also includes your handling pipes at the yards and so on?
A. I don't recollect whether they handled pipes much in the yard there or not if *it* at all.
Q. You can't unload from the cars and distribute on the streets an a big job?
A. That is just what they try to do right along.
Q. If they wait until they get ready before they order they take chances on not being promptly filled don't they and costing money?
A. Oh yes.
Q. That would not be a very conservative way to do work?
A. No.
Q. And in these days pay demurrage if they don't unload cars promptly?
A. Railroads are pretty accommodating if they find the right sort of a switch roll the pipe out and let them lay there and let them take the cars. They don't bother you if out of the way on the siding.
Q. Involves unloading pipes from the cars and the small sizes have to be put into store houses?
A. Everything is in the carting if I remember rightly that occurs between the time they swing the pipe out of the cars and land it inside of the ditch, but I can't give you details of it now four years afterwards.
Q. Have you any idea what your total for your ten per cent and fifteen per cent are in this item of pipe, this aggregate item of pipe?
A. I suppose it could be figured.
2655 Q. You haven't figured it?
A. I did four years ago, but as far as looking up work of mine four years old, might as well be done by another man, I sat

down and looked it over makes no difference what kind of work I have done.

Q. Passing that then, I see something here I want to ask you about for a moment on page 76. On that page the 5th line from the top of the page you have the structural cost of the whole investment per thousand cubic feet sold, $3.22.

A. Yes, sir.

Q. And that is how much in dollars from the total there from which you got your $3.22?

A. $1,700,215 structural cost.

Q. Now then what is the amount of this distribution system on which you figure no depreciation in dollars?

A. The structural cost and the present value both are $625,947.

Q. So by deducting that $652,947 from $1,700,215.00 it will give me the original cost as you make it on the property upon which you figure depreciation?

A. Yes, I think so. Wait a minute let me think that over. On page 72 inventory page 83, contents houses, 6 A, B and C, and No. 7 for water gas manufacturing $62,311 for both structural cost *an* and present value. There is no depreciation figured.

Q. That is about a thousand miles from what I asked you. As I understood you a moment ago you got $1,700,215 as the cost of all of the property?

A. Yes, sir.

Q. Then you got $652,947 as the cost of the mains upon which you figured no depreciation?

A. That is it.

2656 Mr. BYERS: He just told you there was another item he didn't figure any depreciation.

Q. If I deduct that amount I have $1,047,268. Now there are other properties to be deducted are there not?

A. Yes, sir.

Q. Can you give them?

A. Contents generator house.

Q. These are amounts for how much?

A. $62,311 for both structural cost and present value.

Q. Anything else?

A. The only thing that I—these are the only two things I see that are not depreciated. Then there is the land owned which was given to me——

Q. You didn't depreciate the land did you?

A. No, I appreciated it.

Q. I want to get that property that was not depreciated. I don't care for small items. Now then what was the total amount of depreciation which you charged against this property not taking into account appreciation in real estate, excluding that.

A. The residual appreciation——

Q. No, I don't want that. Not residual depreciation. I want

to know how much you charged against us in dollars here on account of depreciation.

A. $299,128.

Q. That is the net amount is it?

A. That is the amount.

Q. Don't that include appreciation of real estate?

A. Yes, sir.

Q. Well give us the amount if the depreciation with appreciation on the real estate out?

2657 A. On page 77 the structures of this gas plant and apparatus for the purpose of supplying gas is depreciated $363,-363. And the land purchased for the purpose of supplying gas——

Q. I don't care about that, you have answered the question. If you took out depreciation to the amount of $363,363, charged that against the property, which you estimated to cost $1,700,215 it gives $984,957?

A. Wait until I figure it.

Q. Cost $1,700,215, mains $652,947 which I deducted then giving a balance of $1,047,268. You gave me another item $62,311. That leaves a balance $984,957?

A. 984,957.

Q. That property you depreciated to the extent of $363,363?

A. That seems to be what I depreciated.

Q. Or about 37 per cent on the average?

A. 36.8 per cent.

Q. That would give present per cent condition on the average 63.2?

A. Meaning by that of course what is left, 63.2?

Q. Now you give us a value of thousand cubic feet sold of $2.65 in your report, page 76?

A. Yes, sir.

Q. Now do you remember a conversation that you had with Mr. Haines on or about the 3d day of February 1911 at the office of the gas company here in the city at which yourself, Mr. Haines, Mayor Hanna and myself were present?

A. I remember such a meeting.

Q. And do you remember telling us at that meeting that the value of the plant here should be from $4.50 to $5.00 per thousand cubic feet of annual sales?

A. I don't recollect that at all.

Q. Would you say that you didn't say that?

2658 A. I might have said that the original cost would approximate $4.00 something of that sort. I hadn't at that time seen the plant at all if I remember rightly and probably spoke of the original cost of other plants and not of this at all.

Q. And did you not, in that conversation say that the value of the property of this company should be somewhere from $4.50 to $5.00 per cubic feet of annual sales.

A. I certainly didn't say so in regard to this property. I may have said such were generally the facts in regard to gas works mean-

ing more particularly with regard to coal gas works and meaning by that not present value, but original structural cost.

Q. I only asked you what you said in this conversation. And you also told us at that same time didn't you that gas could be furnished at the meter for from 50 cents to 52 cents a thousand in your judgment?

A. You mean at a cost of 50 to 52 cents?

Q. Yes.

A. Yes, seemed to me it ought to be.

Q. Do you remember that in that conversation I took a piece of paper and made a memorandum of those amounts asking you if you had any objection to me putting them down?

A. I don't remember that at all. It seems, if you will allow me to explain, it seems almost impossible I should have expressed any such opinion in regard to works which I had not seen had not examined carefully. I could have mentioned these facts as being common facts in the case of most of the works of the country, but at that time I am quite sure I was not aware of the fact that they make nothing else but carburetted water gas and no coal gas at all.

2659 Q. And you went on did you not in that conversation to compute the return on the ba-is of $4.50 or $5.00 as the average cost per thousand cubic feet and reached the conclusion that 90 cents was a very reasonable rate and profitable to the company didn't you?

A. I don't remember of computing in the presence of any of you, in fact I don't think I did anything of the sort.

Q. And in that conversation——

A. I probably did say that I believe 90 cents to be a very liberal price because it was a remark which I had made to the mayor before going to your office at all and that is the only thing that I recall distinctly.

Q. And you computed that and told us did you not in that conversation that on a seven and a half per cent basis it would require 30 to 37½ cents per thousand cubic feet to take care of the investment making a fair price from 80 cents to 87½.

A. Wasn't it from 82½ to 89½ wasn't it about that?

Q. No, I have the memorandum before that I made at the time.

A. I think you are mistaken about that, my opinion was it was all generalization and I made no computations to you whatever doing nothing more than discussing the problem generally about 82½—might be 82½ and might be 89½ would be the price that would be fair. I am quite certain that I did not in any way profess any knowledge whatsoever of your works in any detail or form, I was discussing the price of gas generally throughout the United States.

Q. I think somewhere there has been some reference to a letter or report that you made to the mayor about the 17th of Febru-- 191[illegible]

A. Yes, sir.

Q. Have you a copy of that with you?

2660 A. I have not, no.

Mr. GUERNSEY: Will you produce that Mr. Brennan, please?

Mr. BRENNAN: What letter is it you want?

Mr. GUERNSEY: It is the letter from Mr. Marks to the Mayor, dated February 17, 1911.

Mr. BRENNAN: I don't recall that any reference was made to it up to this time, but we will look it up.

Mr. GUERNSEY: I don't know whether there has been here, but I think there was some conference at which there was some reference to that.

Q. Didn't you say this in that letter, speaking generally I should estimate the probable cost of gas in Des Moines as follows: Cost of gas, 18 candle power at consumer's meter 45 to 50 cents. Royalty 2 cents. 52 cents. Investment profit, $4.00 per thousand sold at 7½ per cent 30 cents, or $5.00 per thousand sold at 7½ per cent 37½ cents. Fair liberal price 89½ cents. Didn't you say that in that letter?

A. Well I know I put 89½ cents as the outside price but I want to say I didn't pase it on these works at all, but it was in response to a request from the Mayor to give him an idea of what gas should be made for and sold for here and I very naturally took coal gas as being at least part of your concern not knowing that you had the cheaper process and cheaper plant in some ways of gas, carburetted water gas.

Q. In this letter then you did estimate the value of the plant at four to five dollars per thousand cubic feet of sales?

A. I did nothing of the sort. I venture no estimate whatever on what you had here for I had no facts to base any such estimate at all.

2661 Q. Didn't you as I have just read in this letter compute your return at 7½ per cent on $4.00 per thousand sold and then on $5.00 per thousand sold at the same rate?

A. I would have to see the letter first. It was a letter that the Mayor asked of me in a confidential capacity which I wrote to him as a general guide, general idea of about what was right.

Q. You arrived there in that letter at a conclusion of 89½ cents for 18 candle power gas?

A. Coal gas.

Q. 18 candle power gas?

A. Coal gas I told you.

Q. I know, but I ask you about the candle power?

A. Yes, sir.

Q. You arrived at that conclusion for 18 candle power gas and not 22?

Objected to as irrelevant and immaterial.

A. 18 candle power coal gas.

Q. And not 22 candle power gas?

A. No.

Q. Now you say on page 76 in your report this, at the bottom totals rejected claims for rate appraisements and all duplications in full of apparatus. What are the duplications in value of apparatus that are referred to?

A. Line pot drips, valves in street steam and street railway crossings, that is what I would call duplicated apparatus.

Q. Now on page 84 you have five years' operations with deductions of $16,746.88 and some additions. Did you make up this table?

A. That is a very general question. I did the computation and put it together, receiving the data from the city accountants.

2662 Q. That is they gave you the total operating?

A. Gave me the total operating expenses for five years from the company's books and they submitted for my approval the following items accident and damages occurring in 1893, replacement value, salary, time and expenses of engineers, draughtsman and others on inventory, interest on floating debt and interest received on bank bonds.

Q. As to this item $3,685.17 accident and damages 1893, that is an expense that was incurred on account of some personal injury that occurred in 1893?

A. Yes, sir.

Q. Was that 1893 or 1903. Thirteen years looks a long time for it to be running?

A. 1893 as I recall it, I might be mistaken.

Q. You think that because of the time it ought to be charged to the year when it occurred?

A. Well it looked a long ways off to appear in 1910.

Q. When was it paid as a matter of fact? This is five years of course to 1910 was are talking about here?

A. Well 1905 you know.

Q. When was the payment made as a matter of fact.

A. I was told that the accident occurred in 1893 when the payment was made, I don't know.

Q. Now then were you told there are pending now claims for $150,000 of this same character that have arisen since 1906 and have not been paid and on account of which nothing has been added in the operating?

A. No.

Q. Did you make any inquiry to see what adjustment ought to be made in the company's favor if you were to adopt the time

2663 the accident occurred instead of the time when payment was made as the proper time to make the charge to your operating?

Q. No.

Q. Didn't it occur to you that it would be necessary to adjust both ways to get a fair result?

A. It is about this way that within five years of the time any of these claims for damages come up, anything of that sort on the average you get—one reason for taking five years you get the average or sort of cycle of the concern particularly in a coal gas works. You get a cycle of the repairs and average of five years, the first time I ever heard it brought up, would be likely to bring out any expense unless something extraordinary occurred and any damages paid.

Q. That don't answer my question, what I want to know is

whether it would not be proper in your judgment if you are going to strike out of this account the payments made on account of accidents that occurred prior to your period to add something to this account for the expenses that occurred and where suits are now pending and where the expenses have to be taken care of as of this period on your theory.

A. No, I think not, I think five years is long enough to let the thing run, close it out both ways, front and back.

COURT: This goes back seventeen years?

A. That was the statement made to me by the city's accountant?

Q. I want to turn over to some of the other computations with reference to increases of sales of gas with decrease in price. Beginning page 91 of your report they are all predicated upon conditions in Massachusetts are they not?

A. Yes, sir.

Q. Now with reference to this matter or question you tes-
2664 tified to this in the New York case didn't you, it is not possible for a mere accountant familiar only with figures and unfamiliar with the practical process of gas making to authoritatively determine the distribution of vouchers and accounts now assume these vouchers to have been properly distributed to determine the proper account which should go to operating cost and which should go to capital or investment accounts. You testified to that in the New York case?

A. I did.

Q. In all of these questions of account you have taken the figures of somebody else haven't you, the computations of somebody else?

A. I accepted no one's figures unreservedly without careful scrutiny on my own part.

Q. You give over here on page 83 the operating costs for five years. Now did you check those with the books?

A. It was quite an impossibility, but I went over them most carefully and checked them with each other and asked a great many questions in regard to some of them before I was satisfied to accept them.

Q. The accountants made these figures and analyzed these accounts and gave them to you didn't they?

A. Mr. James Hall was one who did. And is most exceptional accountant in his ability and experience.

Q. What experience had he had in a practical point of view in gas making?

A. He had a very long one in the consolidated gas suit in New York City, a practical discussion of their accounts in all shapes and forms.

Q. I was asking about gas making?

2665 A. He has nothing to do except with the accountant and there he was with the engineers of the city day in and day out and weeks at a time.

Q. Now referring to this first table on page 91 here the populations are populations shown in the census of 1910?

A. Yes, as given by the Massachusetts Gas & Electric Light Commission.

Q. And have you the 1910 report of the Commission with you here?

A. Not in this room. I have at my room.

Q. I notice here in the 80 cent gas in the first table that the per capita sales in Boston are 6,190 in these figures and in Worcester, 4,340 with the same price, the difference in Boston being at least I think 45 per cent higher than Worcester. If there were any fixed rule, how do you account for the fact that in one of these cities at the same price the per capita sales are 40 or 50 per cent more than the others?

A. When a city reaches about 75,000 inhabitants it changes from an ordinary town into a metropolitan city. That change is not at exactly 75,000, it is somewhere in that neighborhood the inner life changes, the theaters, very large buildings, places of amusement, parks, everything of that sort restaurants, saloons, the night life increases after you reach 75 in any city and you will see it right here, the value of real estate and buildings, everything going up on account of that sort of thing after you pass 75,000. I have been employed a great deal in Worcester, Massachusetts, so I happen to know, a mere accident, why Worcester does not have the amount of use of their gas or electricity that Boston does per capita. Worcester is very unfortunate in one respect it is within about an hour's easy ride of the city of Boston and the consequence is that excepting the very commonest kind of cheap theaters, every-
2666 body that wants to go to a theater goes to the city of Boston where there is a lot of good ones. There are no theaters that amount to anything in Worcester. It is equally true of the restaurants, anybody feels inclined to indulge his appetite of an evening hops on these trains which are continually going, steam trains in cold weather or trolleys in warm and goes into Boston and the consequence is that a great deal of the demand for gas, the demand for electricity, the demand that is greatest perhaps, where the most dissipation it is deserted almost altogether in Worcester and is in Boston, Boston in other words sucking the extra cash and the life out of Worcester.

COURT: I suppose Boston being the Athens of America would be burning more gas than others.

A. Boston does burn a great deal more than Worcester and burns a great deal more electricity.

Q. To get back to the question the fact that at the same rate there is a per capita of consumption in Boston of 6,190 as against a per capita consumption in Worcester of 4,340 would indicate that there is no hard or fast rule which makes the per capita consumption dependent on the rate at which the gas is sold wouldn't it?

A. I have been most careful to so state.

Q. For instance the per capita consumption in Lynn, where the rate is lower than in Boston is less than in Boston where the rate is higher?

A. It is in the same unfortunate position Worcester is, anybody that has any money to waste goes to Boston to do it in the evening.

Q. Now will you turn to the next table here and turning
2667 to the report for 1910, give us the population served in east Boston?

A. It is given here 40,940.

Q. That is an error isn't it?

A. May be.

Q. Well you look at the report and see? The population in each instance is the population served is it not?

A. Yes, sir. I see there is put in here which seems to be right, 90,940 instead of 40,940. I will foot that up and see whether a typographical error or original error.

Q. All right foot it up and see.

A. There is an error of 50,000 there.

Q. Now will you look at Springfield and tell us what the population served in 1910 was in Springfield, see if there was not an error there of 20,000 or something like that?

A. In the case of Springfield the additional population served is Agawa, 3,501, West Springfield, 9,224, Long Meadow, 1,084 and Ludlow, 4,948.

Q. So that the figures for Springfield for population in 1910 should be 107,683 instead of 88,926 should they not?

A. Yes, sir.

Q. Both of those errors would tend to reduce their per capita consumption would they not?

A. Somewhat, not very much. It would not alter the principle involved at all.

Q. I want to see if there is not another error there that would be in your favor. I wish you would give us the sales in thousand- of cubic feet in Lowell in 1910. You have it there 376,672, see if that is right. Isn't that about 200 *hundred* million too low?

A. Gas sold by meter in the year ending June 30, 1910,
2668 554,828,500 and gas for public lighting, 181,844,200.

Q. You are about 200 *hundred* million too low are you not?

A. Just about.

Q. So that in order to get the correct average sales per capita we should add about 70,000 to our divisor and about 200 million to our dividend?

A. I can figure that if you like.

Q. All right; figure it and see if it is about 4,023?

A. Is it worth while. This is simply a generalization showing there is an increase in the sales——

Q. I don't care to have you compute it unless you wish to. I wish though you would go over the table there for Lowell and see if they are right.

A. Total sales in thousands of cubic feet 573,678. I have 373,672.

Q. I want to know whether 573,678 is correct?

A. It appears so should be 573,673.

Q. Well you come within 5000 cubic feet?

A. Are you sure that is not a typographical error?

Q. Yes, we are, you can check it.

A. It makes no difference whatever in what I am trying to show you and that is the constant increase on sales per capita as the price goes down.

Q. Turning to the next table, what the population of Revere served in 1910, I wish you would look at the report and see whether you are right there with 18,219?

A. The Suburban Gas & Electric Light Company of Revere and Winthrop 18,290 and 10,132.

Q. You left out the 10,132 didn't you?

A. Yes, sir.

Q. So that your population served was instead of 18,219,
2669 should be 28,351?

A. Something like that.

Q. Now Taunton, you have 34,290, is that correct?

A. The *twon* of Dighton given here 2,235 and Taunton, 34,259.

Q. That ought to be 36,494 instead of 34,259.

A. Yes, sir.

Q. That would reduce your sales per capita there?

A. Very slightly, make no particular difference in what I am trying to show.

Q. Reduce them from 4,007 to 3,844?

A. Something of that sort.

Q. In the last table on that page there is a slight error or difference of about 8000 in population?

A. Any others?

Q. Not on that page. I think also you will find in your next table the population served in 1910 by Webster given a little incorrectly, but the difference is very small. Now turning to the last column on that page you have population served at Stoneham 7090 in 1910, will you look at the report and tell us what it actually was?

A. Population of Stoneham 7090, also of Reading is 5,818.

Q. About 5000 short there in the population?

A. Yes, 5,818.

Q. Your sales there for Gardner are off about a million cubic feet aren't they? You have 7,298,000. That is about a million feet too low isn't it or a little more?

A. Given here as 8,331,000.

Q. That would reduce your average sales per capita there about 10 per cent wouldn't it?

A. That would only exaggerate still further what I wish
2670 to show.

Q. Now turn to the next table here. In the first place you begin with price $2.25 per thousand in 1901, is that right?

A. Price $2.25 sales per capita 1901.

Q. Now the next you have sales where the price per thousand is $2.00.

A. Yes, sir.

Q. That is all the cities in Massachusetts that charge the $2.00 rate you have averaged in your first column under 1901?

A. Yes, sir. You must recollect one thing you know this is all rough work because when I say $2.00 I don't mean exactly $2.00 but I mean within 12½ cents either way.

Q. It appears to be rough work, my computation shows each of these figures in this table are wrong. Not one of these sales per capita is correct. But we will come to that later.

A. There is no very great pains taken with them I will be frank about that.

Q. I am confident of that because I don't see how pains could have resulted in so many errors. Now what I want to get at is this, you took all of the cities which in 1901 were selling $2.00 gas in Massachusetts as shown by the report for 1910 and got the average sales per capita?

A. Yes, sir.

Q. Then took all of the cities which in 1907 were selling at $2.00 for gas and got the average sales per capita?

A. Within 12½ cents either way.

Q. Now then what I want to get at is this whether the cities in 1907 were the same as the cities in 1901? That is take this column $2.00 that rins across the page you have 1901, 584, 1907, 722, 1910, 614. Now is that average for the same cities?

A. No, of course not, applied to the price of gas in all 2671 cities.

Q. So that don't show the price of gas in any city or class of cities or increase in the sales of gas in any city or class of cities?

A. Oh yes; this sho-s in the class of cities giving $2.00 gas in rough way.

Q. In the same way in regard to $1.75 cent gas, were any of the cities which were selling at $1.75 in 1901, selling it at $1.75 in 1907?

A. I could not tell that without referring back.

Q. Have you your memorandum from which you made up this computation so you can give us the cities?

A. I can't give the cities for 1901 or 1907 because that memorandum is in the form of a paper which was published and the details were not gone into. They are in the same rapid way in which I sketched it 1910.

Q. Can you say that any city under the $1.75 price in 1907 is included in the same price in 1901, or cities of the same price in 1910?

A. I didn't look at it from that point of view, didn't go into it. I was simply c-assifying sales of gas at so much per thousand as near as I could get at it in that rough way.

Q. So what this table means as a matter of fact is that certain cities at the $1.75 price in 1901 had averag- sales of 843 and certain other cities at that price in 1907 had average sales of 898 and that certain other cities at that price in 1910 had average sales of 988.

Q. And there is no comparison of any city to show what the growth has been in that city as prices have gone down?

A. Yes, a very careful comparison in the case of the city of Des Moines. I am talking now about Massachusetts.

A. No, I didn't regard that as important at all.

2672 Q. Now as a matter of fact that 283 there should be 339 shouldn't it?

A. I really couldn't tell you. I told you I didn't even know the cities that are in it.

Q. 584 should be 589 shouldn't it?

A. For 1901?

Q. Yes.

A. No, I think that is about right.

Q. And the 845 for 1901 should be 626 shouldn't it?

A. I think that is all worked out very carefully somewhere.

Q. But where?

A. As I told you it was worked out in 1902 along about that time it is so far back it is out of the question—it was worked it just as I have just explained, worked out not regarded as giving a quanti-tive matter but simply showing the tendency and results of lowering prices of gas invariably showing an increase although often a very irregular one.

Q. Is there any way by which you can tell us what cities are included in the 225 rate for 1901?

A. None except going back and getting hold of the volume for 1901 and that I have not with me.

Q. Now will you *that* if you take the cities for 1901 having the price you state as shown by the report of the Massachusetts commission that any figure in that 1901 column would be right?

A. I think for your purpose they are all right. They show universally as the price of gas goes down that the consumption of gas goes up, that was all that I wished to show.

Q. Did you take any one city and run that through with it?

A. In 1901?

Q. From 1901 on?

2673 A. No. Except Des Moines.

Q. Now there is another thing that they do isn't there in Massachusetts that has some bearing on this. They maintain a constant population for five years in their reports taking the census and maintaining the population constant for five years and then jumping to the next census?

A. Well I don't know.

Q. Isn't that — they do?

A. I don't know how they do there. I never thought of it. I am perfectly willing to accept their facts.

Q. Haven't you carefully studied these reports?

A. In regard to that?

Q. In regard to the whole situation?

A. Massachusetts reports in regard to development of gas if I thought I could get an accurate rule out of that I would take no end of trouble.

Q. You have got an equasion in there?

A. Got an equasion in but you will find the equasion for 1901 is

entirely different from the one for 1907. There is no use pretending to an accuracy that you cannot reach.

Q. Getting back as a matter of fact, do you know how they treat this population matter in reports whether they attempt to give the actual population or whether they adopt the census and carry it until the state census and then carried that until another federal census in five years?

A. I could not say.

Q. Of course if they do that is there *is* any increase in your population your per capita consumption is too high four years out of five isn't it?

A. Well yes if they only make a hop once in five years
2674 the gas would probably roll along up per thousand for a lower population than real. But these Massachusetts cities are slow of growth and very thrifty and the commission knows what they are about if they don't change the population.

Q. Well take one of them here, Lawrence, I see that in 1901 the population was 81,127. That population was used continuously for 2, 3, 4 and in 1905 it jumped to 89,972. That was used continuously to 1910. 1910 it jumped to 110,170. That is an increase for the ten years of 25 per cent roughly?

A. Two and one half per cent per annum.

Q. Is that a fair average increase in population for ten years?

A. I should say it is very unusual for Massachusetts.

Q. Well I notice that in the same period Cambridge jumped from 162,152 to 158,924 also just about 25 per cent. Does that look right to you?

A. That is a college town you know, it is different as far as gross is concerned and the manufacturing towns are the towns that generally burn the most gas and most electricity.

Q. Suppose you should take one town like Lawrence and run that down for ten years and get your reductions in prices and your increases in consumption, would you say that would be as good a test as good a criterion of the affect of the reduction of price as would be comparing Lowell at Lowell in 1901, and Cambridge in 1907 and Worcester in 1910?

A. If you are seeking what I sought in the Massachusetts discussion a generalization directly state- and was not to be quant-ative but simply showing the general tentative or law it would be the greatest mistake in the world to take up an individual city with the idea of proving anything of that sort. Nothing but these aver-
ages that you have will show the two ways in which gas
2675 seems to increase per capita. One is by the steady growth which you notice has occurred in the Massachusetts cities, occurred very irregularly without any change in price, but still occurring all the time as the price gets lower the growth without change in price seems to grow stronger, and the other is the growth in the sales per capita due to the reduction of price and to pick out any one city whatever it might be you are liable to go either way and do an injustice in making comparisons with it.

Q. What city in Massachusetts is most nearly like Des Moines in its population and conditions as far as gas sales are concerned.

A. I can't answer that question at all. They are thrifty people in Massachusetts and not the same conditions, not liable or not willing to spend as much for gas, their towns do not change as rapidly, not as many new buildings going up and the consequence is there is not as much gas put in as there would be in a town of smaller population in Iowa where the constant change is going on and the growth going on.

Q. So that the situation in Massachusetts is not analogous to the situation in Iowa.

A. No. Just as you would not expect a Massachusetts man to do business the way an Iowa man would.

Q. Will you check up this first table on page 94 and if you can find any figure in it that is exactly correct will you point it out to us, between now and the next hearing?

A. I don't think there is any attempt made, there could not be any attempt made where one took a range of 25 per cent or 12½ cents either way from a certain given price to obtain accuracy in the matter to have attempted to have obtained accuracy in this
2676 matter would have filled a report bigger than the whole of the report I turned in.

Q. So you don't pretend it is accurate?

A. I have stated so at the outset and at the end, and approximation, it is only a rude approximation showing the growth of gas on reduction of prices.

Q. You have a table headed study of increase per capita for dollar gas showing an increase of 179 feet. Are you willing to say that may be 131 feet if computed accurately on the basis of what precedes?

A. Might be a hundred or might be 200 but it agrees with the main thing to be proved.

Q. Now in the same cities the sales per capita are ascertained by dividing the gross sales of the year by the population?

A. Yes, sir.

Q. Consequently your sales per capita do not indicate that each indi*vudal* consumer is taking more gas. You may double your number of consumers may you not?

A. The sales per capita makes no mention of the sales per meter and purposely makes no mention of sales per meter. It is intended to show that a community as a whole and on the average their attitude towards the gas company. Their desire to use gas regardless of whether it is done through a thousand or ten thousand or twenty thousand meters.

Q. Then your figures here would not show whether the individual consumer was using any more gas or not and you could not tell that without going further than you have gone and taking the number of consumers.

A. Correct.

Q. Consequently your increase here would not afford the
2677 basis for any inference as whether or not to obtain this additional consumption a*j* additional investment had been made necessary?

A. In services and meters you mean?

Q. In services and meters and in mains and in manufacturing plant.

A. In a general way, no.

Q. Now have you ever taken any of these Massachusetts cities and run through a period of ten years to see whether your theory is right that people spend about so much for gas or whether this additional consumption per capita was due to the increased number of consumers with an increased investment?

A. I never have carried my work into such detail as that.

Q. Don't think that would be a very material factor if we are to use this for the purpose of determining whether the Des Moines Gas Co. can be held here to furnish ten per cent more gas without any additional investment in the plant?

A. No, I don't think that a matter of importance.

Q. You assumed that in the first year the Des Moines Gas Company would sell 600 million cubic feet at the 90 cent rate didn't you?

A. No, I said when it got to the 600 million cubic feet. I didn't say when it was.

Q. Did you not say this at the bottom of page 95, the statement has heretofore been made that the safe capacity of the existing works of the Des Moines Gas Co. is about three million cubic feet per day or say 600 million or more cubic feet per year. Its sales 1910 amounting to 528,375 thousand cubic feet it is reasonable to assume that the price of gas at the rate of 90 cents per the ordinance of December 7, 1910, 600 million cubic feet annual sales, the works capacity will be reached. You say that don't you?

2678 A. Yes, sir.

Q. Then you say following this it is obvious that the only increase required to reach its capacity will be in the oil, coal and coke for fuel and the purifying material in general all the other conditions of operation will remain as they are today.

A. Yes, sir.

Q. Was that in contemplation of obtaining 600 million some time in the next ten years or in the first year?

A. Oh I would not be the least bit surprised to hear you were doing that right today, 600 million.

Q. I didn't ask you that, I asked you what assumption was this statement made?

A. Well within some reasonable time, a year or so you would get along to it.

Q. How soon did you say, a year or so?

A. Yes, a year or more.

Q. How much more?

A. Well I don't know.

Q. Isn't it important to know?

A. Well you never should prophesy unless you know. I think the books would show if you have gotten to it already. You ought to.

Q. Now you say following this that the sales would run up to 600

million. Now passing that what do you figure per capita sales would be when we get to 600 million?

A. Of course it would *ge* 600 *hundree* million divided by whatever population it is you sell to.

Q. Well how soon is that going to happen?

A. I just declined to state that definitely, gave it to you as my opinion that if it has not happened already it will happen—

2679 I would not be at all surprised if it happened already.

Q. Do you say it has happened already?

A. I would not be at all surprised if it had happened already.

Q. If it has happened already it will give us in the actual case a very fair check on your accuracy of 25 cents per thousand here will it not?

A. No, not if you jump your accounts in the way you did in 1910.

Q. You refer to the two items of $15,000 that make a difference of three cents?

A. No, to the increase all along the line everywhere, run down these five years or four, run along pretty smoothe and get to 1910 they jump right up every one of them, big increases in all the different forms of repairs and operating expenses.

Q. Well let's get back to that for a minute and have you point some of them out. In 1908 the cost per thousand was 64.0——

A. Will you pardon me if I refer to what I was speaking of?

Q. I beg your pardon but I only refer to the exhibits showing the actual book cost. Will you take this Exhibit 24 and take the cost per thousand for the two months ending February 28, 1906 and what was it. You were talking about the way we have jumped things, these amounts are the book items, this is what our books show.

A. Will you allow me to call your attention to another thing in Exhibit 24?

Q. I prefer you answer the question.

A. Will you allow me to complete the answer to the original question.

Q. I prefer to have you answer my question.

Mr. BRENNAN: I would like to have him answer the question in the way in which he thinks he can answer.

2680 Q. The question is referring to Exhibit 24, what does it show the cost per thousand to be for the two months ending February 28, 1906 I think you can answer that very easily from the exhibit.

A. I was speaking more particularly in the accounts there in the way in which they increase, not 24.

Q. I know but I am asking the question now answer it if you please.

A. You cut me off on the way I wanted to answer the question, the one you asked me by switching in another question before I answered.

Q. Please answer the question. What does the cost appear there for two months ending February 1906 of gas per thousand, as shown by Exhibit 24?

A. This is complainant's Exhibit 24 and there is for the two months ending February 28, 1906, there is given total operating expenditures, 74.15 per M sold.

Q. It is cost per M made?

A. No, if you go down a little below that you will find per M cubic feet sold.

Q. Now if you will go -ver to the year 1910 and give us same cost including the two disputed items amounting to about $15,000 or about 3 cents per thousand, that is the 12 months ending December 31, 1910?

A. It is shown on this account as being 66.47 cents, but it is absolutely unfair and incorrect as a means of comparison. Two months being compared with a year.

Q. Now will you take the cost per M for the twelve months ending February 28, 1907, as shown by this same Exhibit and what are they?

A. The total operating expenses in that twelve months give 65.81 per thousand cubic feet sold.

2681 Q. And for the next twelve months is what?

A. For the twelve months ending February 29, 1908, the total operating expenditures give 64.1 per thousand cubic feet sold.

Q. And twelve months ending February 28, 1909?

A. The total operating expenditures 59.69 per thousand cubic feet sold.

Q. And for the next ten months period?

A. The ten months ending December 31, 1909, gives 62.56 cents as the total operating expenditures per thousand cubic feet sold.

Q. Now this 1910, 66.47 less the three cents, 66.47 is at least as low as the average for this five — period isn't it?

A. It looks that way.

Q. Ans that is the expense as it jumped up in 1910.

A. Will you allow me to answer your question now?

Mr. BRENNAN: Go ahead and answer it yes.

A. That is not the expenses to which I referred and the jumping, it is this, the repairs to works for 1907 were, 9,699,99.

Q. What page are you reading from?

A. Pages 79. For 1909 the repairs to works was $6,825.23; 1909, 5,996.71; and for 1910, where the jump occurs $14,193.78. Again the repairs to mains for 1907, $2,838.28, 1908, $4,420.78, 1909, $3,166.75; 1910, $9,347.30, again a jump. Repairs to services 1907, $469.22; 1908, $504.92; 1909, $910.41, 1910, 5,224.76. Repairs to meters 1907, $2,392.77; 1908, 3,443.85, 1909, 4,772.99; 1910, $5,211.63. In every case a very great jump except in the case of meters.

Q. Now you say in your report this, the Des Moines Gas Co. presents the following record of repairs covering a period of four years and giving yearly averages which probably are not as accurate as might be derived at a longer period. What does the last

2682 part of the statement mean that you thought that taking these averages and these jumps, does it mean in your judg-

ment the charges are excessive or not, or the charges probably are not as great as might be derived at a longer period.

A. I presume it was my intention to say that they are not as great as they would be if continued for a longer period.

Q. That is if you have taken your average over a longer period instead of this five years?

A. No, I have taken four years, if I would go on for 1911, what I mean to say?

Q. You wanted to insinuate in 1911 there would be something wrong?

A. No, keep on going up.

Q. Did you make any effort to ascertain what causes this increase in repairs to mains for instance?

A. Yes, sir.

Q. Did you l-arn that the repairs to the mains and to the s-rvices increasee in 1910 because the city had changed the grade on a good many streets such as east 6th street, east Des Moines street, east Locust street, east Second street and many others involving the company in *the* unusual expense in lowering or raising mains and services.

A. That didn't interest me so much as repairs to works, $14,193.

Q. That don't answer my question.

(Question read).

A. Only in a general way was a reference made to the matter, no specific reference to streets or anything of that sort.

Q. You didn't take the trouble to find out what in fact caused this increase?

A. I asked about it.

Q. You didn't follow it up so you found out?

A. Gave instructions to find out about it, no I did not.

2683 Q. You might follow it up on the books?

A. No, I didn't follow it up on the books.

Q. Did the accountants follow it up on the books?

A. Well I don't know how far they followed it up. I made but very slight inquiry *anything* about the matter.

Q. You just condemned it without knowing what caused it?

A. I made no condemnation, I noted the fact expenses jumped up. Might possibly be your error was the other way, you made up on repairs in the business, I have not passed any opinion on it.

Q. Then if I understand you correctly you do not want to be understood as criticising these amounts as improper amounts under the circumstances?

A. No further than as shown and comparative inconsistency of the management.

Q. Well would you say that it showed inconsistency of the management to charge into the operating expenses of 1910, the extraordinary amounts which on account of the action of the city in changing grades it had been necessary to extend on the mains and services?

A. I have called your attention to it, I rather decline to express an opinion at all until I had investigated it very thoroughly.

Q. And that also would be necessary with reference to these other

things, take repairs works, do you know what items make these increases in 1910 in repairs works?

A. No, sir.

Q. Until you do you could not very intelligently either approve or condemn them could you?

A. That is the way I look at it.

Q. The same thing is true all the way through isn't it?

2684 A. All the way through. My point is the sudden jump.

Q. And with this sudden jump here there must have been an economy somewhere else to keep the average down where it was in 1910?

A. Average per thousand, good showing.

Q. Good showing isn't it?

A. Good showing, yes; no getting away from that.

Here the further hearing was adjourned until 9:30 A. M. tomorrow.

2685 Tuesday Forenoon Session.

AUGUST 22, 1911—at 9:30 a. m.

Counsel for the respective parties all present.

Testimony on part of defendants resumed as follows:

WILLIAM D. MARKS, continuing his cross examination, examined by Mr. Guernsey, testified:

Q. Now, yesterday I was asking you about this proposed 600 million, I asked you when we were to assume that that amount of output had been attained, or that amount of sales had been attained, and as I understood you, you couldn't fix any definite time. How in your direct examination on that question the assumption was that this volume of sales would be obtained in a year, was it not?

A. In about a year from the time of change of price.

Q. So that is the assumption upon which you gave your testimony and made your estimate, is it not?

A. No.

Q. Well, now, let me read the question, page 2348 of your direct examination: "Now assume that at the end of the year, we will say one year after the ordinance was in force, the one in controversy, that the sales of gas would amount to say 600 million, about what would be the rate of return based upon your valuation in this case? A. About ten per cent with gas at 90 cents." Was your answer there based upon the assumption there in the question that this volume of business would be attained in one year and is your computation in your report based upon that assumption?

A. First of all, to go from 550 million to 600 million means an increase of about ten per cent in the sales. Looking at

2686 the exhibit of this complainant, shown on page 88, I observe——

Q. You mean page 88 of your report?

A. Yes, page 88, I observe that the increase going from $1.10 to $1 was given as being about 15 per cent and then sticking at the

price of $1 for the years 1906, '07, '08, '09 and '10, the increase became slower and slower until it was only 7 per cent per annum. Now it appeared to me, judging from analogy, and of course you understand that this is rough work shown here——

Q. I concede that——

A. Shown here in this column of your exhibit that at the best can only be an approximation, but it seemed fair to assume that about ten per cent would accompany the reduction of the price of ten cents somewhere within the neighborhood of a year after that reduction had been made. I understand, however, that the fact of the matter is that you have gone on increasing your sales—this is merely a passing remark—which leads me to believe that you are very close to the 600 million already.

Q. To get back to the question—then your testimony and your report are based on the assumption that the sales of 600 million will be acquired in a year?

A. They are not.

Q. They are not?

A. No; there is no such exactitude possible.

Q. Are the- based on the acquisition of that amount or volume of business within any specific time?

A. Within a reasonable time, one year perhaps, perhaps a little more, perhaps a little less from the time you go to 90 cents.

Q. Approximately a year?

2687 A. You may put it that way, but approximately is a little close.

Q. Now to go back a little—you said when we decrease the rate from $1.10 to a $1. we jump 14 cents, or 15 per cent. Now if you will look at the table you will see that in the first year after the dollar rate went into effect, our increase was 11.3 per cent?

A. 11.3—I see in the second year it was 15 per cent; that only verifies what I was trying to tell you.

Q. 11.3 per cent the first year?

A. Yes.

Q. And that increase was less than the increase in any one of the five preceding years, was it not?

A. No, I see you have 9.2 per cent there——

Q. I know, did you count right—that is the sixth preceding year, isn't it?

A. I will see.

Q. Just count it up? Starting with 1905, '04, '03, '02, '01——

A. Do you count that in?

Q. That is the sixth preceding year.

A. But the $1.10 is the preceding year; this takes in five preceding years.

Q. My question was the years that preceded the reduction; now the reduction was January 1, 1906, and the increase in the year in which the reduction occurred was less than the increase in any one of the five preceding years, was it not?

A. Slightly less than some of them.

Q. Well slightly—one of the five preceding year- was 28.4?

A. Yes and one was 13.

Q. But the average was nearly double this 11.3 per cent, wasn't it?

A. I haven't figured it up.

2688 Q. I haven't either, but just looking at the figures I would say it was.

A. It is all right to say double in work like this anyhow.

Q. Now, then, this statement is rather interesting—let us go back a little. Have you taken this statement, take for instance that 15.4 per cent in 1907; have you looked through the expense, the operating expense to see whether an abnormal amount was spent to extend the business at that time?

A. I have not. I have had a very limited time, indeed, in which to go over these matters.

Q. It would be necessary to do that before you could ascribe this to a mere decrease in the price—isn't it possible to extend the gas business as any other business?

A. You can create a precocious growth in the gas business by the methods you are using here. I don't say that in the way of criticism at all, but rather in the way of commendation, and it has been done evidently.

Q. So that is would not be safe to take these figures alone to draw conclusions from?

A. Not at all if you try to draw exact conclusions.

Q. Now, then if you increase this per capita to 600 million, this volume of sales to 600 million within two years, what would our sales per capita be, say when the population is 87,000—86,000 plus by the last census of 1910?

A. 87,000 is what I would take, is it?

Q. Yes, I call it 87,000 instead of 86,000; I want to emulate you and give you the benefit of the doubt.

A. It would be near enough to call it sixty-nine hundred.

Q. Yes. What are the sales per capita now, do you know, in Des Moines?

2689 A. I was told about six thousand, in that neighborhood, so closely there was no difference.

Q. Do you know of any city in the United States at 90 cent gas that has sales per capita of 6900?

A. Certainly no New England city; I haven't looked that matter up.

Q. Wouldn't that be a very material factor in determining what the future of this proposition was going to be here?

A. Not in a rapidly building community like that of Des Moines; not in one that is always putting up new houses and small houses too.

Q. Now, I have a list of some of the cities here—Baltimore, with a population of 600,000—a very much larger place than Des Moines, with 90 cent gas, and sales per capita of 4454?

A. Yes, I had occasion to look into Baltimore; I am not talking about the last year or two; up to that time it was just about the most poorly managed gas outfit in the United States.

Q. Take Providence has 225,000 population and the sales per capita are 4796, that is right?

A. As I stated to you, you will not find that in New England; they are not growing communities.

Q. Let us go to Denver then, a very prosperous and extravagant city, farther west than we are, and have a population of 213,381 with 90 cent gas and sales per capita of 5022.

A. I don't know the sales per capita; that would be about what I would expect of Denver.

Q. Let us take Richmond, Virginia, they have a population of *of* 127,000 and sales per capita of 3406, at 90 cent gas.

A. There you get again in a community in which a large population is colored and as a natural consequence the per capita is not a fair criterion.

2690 Q. The- take Hartford, Conn., they have 90 cent gas and a population of 110,000, and the sales per capita 5047.

A. That is about right; you understand I distinctly except throughout New England.

Q. Didn't you take New England as the entire basis of your report for the computation you make?

A. Simply to show the growth of gas.

Q. It is not at all as a basis for what you anticipate in Des Moines?

A. Not at all; simply to show the general tendency.

Q. In Lowell we have 90 cent gas, and a population of 107,000, and the sales per capita 5128?

A. Lowell is one of the best New England cities.

Q. Now, then, going further west, Fort Wayne has a population of 75,000, 90 cent gas, and 3000 sales per capita?

A. That I don't know. I would have to go over that. I should think they ought to be better than that.

Q. Will you verify that for us?

A. Yes. What are the figures?

Q. Population of 75,000 and the sales per capita——

A. No the total sales please.

Q. I didn't give you the total sales, gas sales, they exclude the street lighting.

A. That would give you about 3000 per capita.

Q. And the rate is 90 cents?

A. Yes.

Q. Go a little further west to Peoria, with a population of 70,000 and sales per capita of 4381 at a rate of 90 cents.

A. Of course the only point is not what these towns are doing, but what the city of Des Moines is doing according to your books today.

2691 Q. I know, but I think there is something in your report about what you call satiation?

A. Yes, properly should be.

Q. I won't quarrel about definitions—that is a factor to be taken into account in determining what the possibilities are of developing and increasing the business.

A. At any given price it should be taken into account.

Q. And in determining whether or not that point would be reached you would naturally compare the consumption per capita here with the consumption per capita elsewhere, wouldn't you?

A. In the same rough way in which I used New England to show a general tendency; certainly not as an accurate quantitative method.

Q. Now take Terre Haute, Ind., that has a population of 65,000, and sales per capita of 3558 at 90 cent gas?

A. I will have to accept your statement; I haven't looked it up.

Q. Are you willing to accept it?

A. I said I would have to do so.

Q. I don't want you to do it under duress, but I would like to have you verify it?

A. I have no means to verify it. Of course I am taken by surprise by these announcements.

Q. It would be the natural thing to look up the per capita sales elsewhere if we wanted to form a conclusion of the per capita sales in Des Moines?

A. You might as well look up the general tendencies elsewhere.

Q. Do you know of any city where the conditions are like those in Des Moines that has as large per capita sales at either dollar gas or 90 cent gas, that Des Moines now has, if so, what is it?

A. I have not had opportunity or time to look it up.

2692 Q. So that you don't know then?

A. I can't recall any.

Q. Now, then, what is the increase in per capita sales in Des Moines been due to, has it been due to the fact that the consumers of gas have been using larger quantities, or to the fact that the number of consumers has relatively increased?

A. It has been due to a precocious growth of the business of this company, and that in turn has been due to the extraordinary care taken of your consumers, for I understand that the consumers of the city all feel that you are ready at all times to take care of their apparatus and of them.

Q. In other words, we give them good service?

A. Good service and with the amount of solicitation and advertising which has been done recently, that seems to have resulted alike in larger numbers of consumers in proportion to the population than usually happens in a town or city of this size, and also in the more generous use of the gas than usually happens in a community of this size.

Q. Now, I wish you would take Exhibit 36 and tell us what the population per meter is in Des Moines or was at the end of 1910?

A. Twelve months ended December 31, 1910, population per meter 4.5.

Q. Now, then, on the 31st day of December, 1905, when the last reduction in rates was made, what was the population per meter?

A. Twelve months ended December 31, 1905, population per meter, 5.84.

Q. So that during this period now, since the dollar rate has

been in effect, we have first to start with here in Des Moines, we have now one meter for every four and a half persons in the city, while when that rate went into effect, there were 5.84 persons for
2693 every meter here?

A. I would not be willing to accept it without going over the matter carefully.

Q. Assuming this is correct, that would indicate that the use of gas during that period had been materially extended, wouldn't it?

A. Yes.

Q. And that would tend to increase your sales per capita without reference to whether the persons who had been using the gas before used more or less?

A. If you take the number of meters and divide into the population of any town, you get of course, the number of people as it were, attached to each meter; but I don't say that you can infer from either of the figures 5.84 or 4.50 any more than that.

Q. Well, let me see, if I can make it clear to you. If in Des Moines, or some hypothetical city—we have not referred to a hypothetical city yet—there were a thousand people taking gas, each of them burning 5,000 feet a year, and the population of the city was 10,000, and then the next year 2,000 people took gas, each of them burning 5,000 feet a year, your per capita consumption would be doubled, wouldn't it?

A. The population remaining the same?

Q. A thousand consumers the first year burning 5,000 feet a piece, what would that per capita consumption be that year?

A. Of course, you have 5,000.

Q. You added five million, didn't you?

A. Yes.

Q. Divided by 10,000 would give you what?

A. Five hundred.

Q. Now, then, suppose the next year you had 2,000 people taking gas, each taking 5,000 a year?

2694 Question continued: That would double your consumption?

A. The population remaining the same?

Q. Yes.

A. That would be an increase.

Q. It would double it?

A. Yes.

Q. Well, now, then as you decrease the number of people per meter, you increase the number of consumers, don't you?

A. That assumes a constant population always.

Q. Wait a minute—if your population increases your number of consumers would increase more rapidly?

A. Yes.

Q. You only have assumed a constant population?

A. Yes, you started out with a constant population.

Q. Wouldn't the fact that the number of people per meter decreased indicate that relatively more people were taking gas?

A. Yes, not how much.

Q. It wouldn't indicate how many more, but if there was an increase in population, it would be greater than what appeared on the face of the returns greater than the line of difference between 5.84 and 4.50?

A. Yes.

Q. That would increase your per capita consumption without taking into account the amount consumed by each consumer?

A. I would have to take that specifically in each case; I wouldn't generalize in that way.

Q. Are you willing to say, that the tendency of the decrease, or the increase in the number of meters, that is, the decrease in the population per meter, are you unwilling to say that the tendency of that would be to increase your per capita consumption?

2695 A. Using the word tendency, nothing more than the word tendency. That statement appears to be correct, unless on further investigation it has been found that something has happened to cut down the use of gas per capita at the same time that the cut down of people attached to each meter occurred. You see you can't generalize without qualification in that case.

Q. Now let us study this a little more, because I think it is safer to stick to Des Moines. You notice in 1906 the decrease in the number of people per meter was only .05 and you remember looking at your table in 1906 the increase of sales was 11.3?

A. That is not my table; that is one furnished by the Gas Company.

Q. It is yours by adoption, isn't it—I won't quarrel with you about that; it is the table set out on page 88 of your report.

A. Taking the year 1905 to 1906?

Q. No, the year 1906.

A. The year ending December 31, 1906.

Q. That is the first year of this dollar rate?

A. There is an increase of 11 per cent.

Q. Now, then, if you go to 1907, you get an increase, referring again to the table set out at page 88 of your report, of 15.4 per cent?

A. Apparently.

Q. You will find that your number of persons, your population per meter has dropped some instead of one half of one per cent, has dropped .44, don't you—so that there has been a radical increase in the number of consumers; that is, it dropped from 5.79 in 1906, and 5.35 1907?

A. .44 per meter.

Q. Instead of 1905?

A. Yes.

2696 Q. You observe that?

A. It appears in that way here.

Q. Now, I understood you to testify on your direct examination that the revenue remained just about the same, the revenue per meter shown on this table for the last year in which the dollar ten rate was in force and was 28.50, wasn't it?

A. Referring to the year——

Q. The last year in which the $1.10 rate was in force, 1905?

A. The revenue per meter 28.50.
Q. The next year it is 26.83?
A. It is so given.
Q. The next year it is 27.78?
A. Yes.
Q. The next year it is 28.15?
A. Yes.
Q. The next year it is 22.20?
A. For ten months, yes.
Q. And the next year it is 27.33?
A. Yes—wait a minute; there seems to be 4.54 here.
Q. That is for the two month period. So that the revenue per meter has not in any way got back to where it was at the $1.10 rate, has it?
A. Not according to those figures, if you wish to be very exact.
Q. All we wish to be is right.
A. Yes.
Q. So far as you know this table is right?
A. Yes.
Q. Now, then let us turn to the sales per meter, and see whether they jump up amazingly at the $1.10 rate; the sales per meter were 25843?
2697 A. You mean the year 1905?
Q. Yes.
A. Yes, 25843.
Q. For the next full year it is 26680?
A. Yes.
Q. An increase of about five per cent?
A. Yes, that is 12 month ending February 28, 1907.
Q. So that the increase in the sales per meter is about 5 per cent, and the increase of gross sales according to the table in your report on page 88 was 11.3 per cent.
A. So it appears; you speak of it as my table, it is your own table.
Q. I beg your pardon; I was very careful to avoid hurting your feelings; I referred to the table set out at page 88 of your report.
A. I thank you.
Q. So it won't do to say that this increase was due to an increase of consumption by the people taking gas at the time the price was decreased, will it—now referring to Des Moines and not Massachusetts?
A. It will appear from the figures that you have given here that for the year ending December 31, 1905, the sales per meter were 25843, and then the sales per meter go on increasing in an uneven sort of way and at the end of December 31, 1910, to 26995 or in round figures about 27000; so that it would appear from this table as if the sales per meter had appreciably increased as a result of the lowering of the price.
Q. Now, Mr. Douthirt just made for me a short computation. We find that the increase in the sales per meter in the first full year given after 1905 is about three per cent and the increase in sales is about 11 per cent.

2698 A. Do you mean the year ending February 28, 1907?

Q. Yes; I am again giving you a little the better of it, following your example; you will see in the year 1907 the increase was 15.4 as against 11.4 in 1906?

A. Comparing the two tables with the increase of sales per meter does not follow on as rapidly as the increase of sales.

Q. The increase of sales per meter is about three per cent for that year, while the increase of the total sale is 11.3 per cent, and the conclusion that I want you to deduce from that is that the increase in the sales during that period was due more to the increase of a number of consumers than it was to the increase in the gas consumed by the persons connected.

A. You mean the increase of the number of meters got right down to it and jumped the consumers.

Q. Well, I'll substitute that.

A. That of course happens right along; the increase occurs in two ways; there are more meters, more sales per meter, but the increase in services and meters just about picks up the average depreciation that is going on; so that the depreciation money comes right in.

Q. Now, then, in that year you figure an increase of say 10 per cent for one year on account of the decreased price, haven't you?

A. First of all, I haven't figured a year.

Q. I withdraw that question. I want to ask you another question. Now the sales for the twelve month- ending December 31, 1905, were 25843 per meter, weren't they, as shown by this Exhibit 36?

A. Yes.

Q. And the sales for the five years after that, the year ending December 21, 1910, were 26955?

A. Yes.

2699 Q. Now, the difference is 1112, isn't it, and that is what per cent of increase in five years in the sales per meter—4.3 per cent, isn't that right?

A. About 4 per cent.

Q. So that the increase in sales in five years, due to increase in consumption is something like four per cent as shown by these figures?

A. You can't increase the sales per meter.

Q. Yes. Now, then, during that same period I find referring to the table set out in your report on page 88, that the gross sales increased from 334,404,640 to 531,991,054 cubic feet, and I find also during the same period the population per meter decreased from 5.84 to 4.50; what do you ascribe that increase in sales to, to energy in extending the business, and getting new consumers of a decrease in price?

A. First of all, the influence of the price is seen in the year ending December 31, 1906; we have an increase of 11.3 in the total sales; in the year ending December 31, 1907, we have an increase of 15.4 per cent in the total sales; at about the end of this year I should judge that the influence of the recent reduction of ten cents

in the price had vanished and then comes the regular growth in the sales per capita due to the advance of the art of using gas; for in the year ending December 31, 1908, we have a growth of 7.3 per cent; for December 31, 1909, we have 7.8 per cent; and for the year ending December 31, 1910, we have 7 per cent. In other words, at a constant price a very unusual increase, about 7.8 per cent has occurred during the last three years, due to the unusual efforts and skill with which the service and the people of Des Moines have been handled, but that 7 or 8 per cent is only about .4 or .5 of
2700 the growth which happened during the first two years, the average of this is 13.3 per cent, during the first two years, for the years 1906 and 1907.

Q. During this period, including 1905, down to 1910, that is six years, we find that the sales per meter have increased about three per cent; we find that the population per meter has decreased from 5.84 to 4.50, and we find that the gross sales have increased from 334,404,640 in 1905 to 531,991,054 in 1910, an increase of a little over 59 per cent; now then, do you ascribe that increase in the gross sales to the fact, or to the claim that the consumers when the price was reduced in 1906, used more gas, or to an increase in the number of consumers?

A. It would appear as if both were the case.

Q. And which would appear to be the more important factor taking into account that the increased sales to each meter was only 3 per cent during the entire period, which the increase of gross sales was 59 per cent?

A. What was the increase in the meters?

Q. It don't appear on this sheet; I have got it here somewhere. The total number of meters December 31, 1904, or January 1, 1905, was 11,436, and December 31, 1910, 19,736?

A. That is to say in those five years?

Q. In six years?

A. Is that December 31, 1910?

Q. Yes.

A. The number of meters run up 8300.

Q. Yes, about 70 per cent; now do you think our increase in sales was due to the decrease in price or the increase in the number of consumers.

2701 A. I think it was due to both.

Q. Which do you think was the more important factor?

A. As a basis for decrease in price, for you would not have got the consumers without it.

Q. Now, let us see; now we had here the first of January 1906, 12,940 meters, and on the 1st of January 1907, 14,640; now that would give us an increase of 1700, wouldn't it?

A. That is correct.

Q. Now, then we had on the 1st of January, 1908, 16,076?

A. 1436 difference.

Q. So that the difference in one year we had a decrease in 10 cents and the other year no decrease with the difference of 250 meters—there is a difference in the number of increase?

A. In other words, it began to flatten out; the progress did, the wave of progress.

Q. Now, then, I want to go back a little further and check your theory a little more with the Des Moines business. Now on the 1st of January, 1896, the rate dropped from $1.70 to $1.30 and remained $1.30 for the years 1896, and 1897?

A. The year ending December 31, 1896?

Q. I asked about the rate first?

A. The rate appears to have been $1.30 flat for all purposes.

Q. What was it for the year 1895?

A. $1.70, $1.50, $1.25, for use on a large scale.

Q. Now, then, in 1895 our consumption per meter is 24558, isn't it?

A. Yes, 24558.

Q. The next year it jumped to 26652?

A. 26652 cubic feet per meter.

Q. Then, in 1897 it went back to 24921, less than it was in 1905?

A. Yes.

2702 Q. Those are the two years covered by the first reduction, the two years at which the price was $1.30?

A. That is right.

Q. If you will turn to the revenue per meter you will find in the year 1895, before the reduction it was 38.35; in the next year it was 34.04 and the next year 31.59?

A. Yes, it is so given.

Q. Now, then, on the 1st of January, 1898, we had another reduction to $1.25, didn't we?

A. You omitted one point; before you leave it, the increase of total sales as the result of that reduction was 25 per cent; that is, referring to the table on page 88.

Q. I am willing to digress and am willing to concede an increase in the total sales, but did you notice that during these two years, the population per meter was 22.72, while in 1897 it was 16.61, and did you take into account the increased number of meters which in 1895 was 2448 and in 1897 was nearly fifty per cent more, 3479, and must not you take that into account before you can say that the increase was due to the decrease in price?

A. As a technical proposition, you are to a certain extent right. But these gas companies are in business for money and nothing else; they are not worried over what engineers are doing in these matters and if they can see a jump of 25 per cent in the total sales of their gas, the wise manager, and you have them, does not worry about a few more services and a few more meters; they are a trivial matter, forgotten in the enormous gain there is in the business. That is the reason why I lay some stress on that 25 per cent, as showing the general tendency.

The MASTER: The increase of sales per meter is without

2703 expense to the company, isn't it?

A. Yes, without any additional expense.

The MASTER: But the increase of sales by reason of new customers does increase the expense to the extent of the meters and services?

A. Always to the extent of a meter, and frequently you will find one old service has a lot of new meters attached to it, so that there is no service put in.

The MASTER: It will be increased by the expense of a meter or service?

A. Either the expense of a meter alone or the expense of an additional meter and the service.

Q. Let us check that out a little. I notice by Exhibit 33, for the year ending December 31, 1895, we had a total miles of mains of 38.36 and I note here the total number of miles at the end of 1896 were 48.433; that is an increase roughly of ten miles or something over 25 per cent?

A. Nearly 30 per cent.

Q. Then I observe going on down to where we stopped that from this same exhibit, December 31, 1897 the miles of main were 57.67, so that in each instance there was an increase in services, meters and mains apparently, wasn't there, to get the increased business?

A. Yes.

The MASTER: Are the number of miles of mains in the city of Des Moines unusual, considering the amount of gas sold or are they simply normal?

A. Normal, considering the amount of gas sold.

The MASTER: There are a great many outlying districts?

A. When I say normal, I mean clearly for western cities.

2704 The MASTER: Western cities?

A. Iowa cities.

The MASTER: How is it as compared with New England cities?

A. I should think New England cities had a little the advantage in the number of cubic feet sold per mile of main; everything is snugger, thriftier and closer up.

The MASTER: How is it with Baltimore?

A. I have to figure on Baltimore; I will be glad to.

The MASTER: How is it with Buffalo, if you remember?

A. That would not be fair to compare, for this reason, that the natural gas has gotten into Buffalo and they have four or five hundred miles of mains there; so that Buffalo would be at a great disadvantage as compared with this place; this place would show up a great deal better than Buffalo because the natural gas is in there at 34 and 35 cents.

The MASTER: How is it with the district in New York that you investigated?

A. Do you mean the Island of Manhattan?

The MASTER: Where the Consolidated Gas Company was?

A. That is the richest territory in the world. London, I believe, has between eight and nine thousand sales per capita and that for a long time was considered the richest territory in the world, but New York has gotten up, Manhattan has gotten up to 10,000.

The MASTER: I simply wanted to know how it compared in mains.

A. Well, the sales per mile of main in New York are so far beyond anything else that it is a case of its own.

The MASTER: How is it compared with the city of Boston?

A. I should say Des Moines today the sales per capita was about abreast if not a little ahead of the city of Boston.

2705 The MASTER: Per miles of main?

A. That I can't recall, because I don't know the miles of main in Boston.

The MASTER: I had a curiosity to know. I thought possibly Des Moines had many miles of main as compared with other cities, because I believe it has about 53 square miles.

Mr. BRENNAN: About 54.

Mr. GUERNSEY: The population per miles of main in Des Moines is 467, and the population in Baltimore is 1036, and Boston 672.

The MASTER: I suppose it is just as Mr. Marks said, that the New York district would have perhaps the greatest sales per miles of main in any city in the United States?

A. The sales of gas in New York are so enormous, they won't put in any main now under eight inches. The smallest main we have on the island of Manhattan is away beyond the average and almost the largest size main used in Des Moines.

Mr. GUERNSEY: The city of Harrisburg is an illustration. The population is 98,320 and the population per mile of main is 763 as against 470 here.

Mr. BRENNAN: What is the rate in Harrisburg?

Mr. GUERNSEY: $1.10.

The WITNESS: Gross or net?

Mr. GUERNSEY: Net.

The MASTER: It struck me all the time that the extension of mains here every year was very great.

Mr. GUERNSEY: The record shows that since 1903 it has doubled from 98 miles to 190 miles.

The MASTER: 88 miles; Jansen Haines says 88 miles when he took charge of it.

2706 Mr. GUERNSEY: I took December 31, 1903, when it shows 88 miles.

The MASTER: I would anticipate that the mains as they are extended there would be an increase in services from those mains.

Mr. GUERNSEY: There is and the meters.

Now, there was on the 1st of January, 1998, the next decrease from $1.30 to $1.25 in price?

A. Yes.

Q. That $1.25 remained in effect during the years '98 and '99, two years?

A. Yes.

Q. Now, then, if you will take the sales per meter the year before that went into effect, they were 24,131, weren't they?

A. That is for the year ending December 31, 1897, they are given here as 24,131.

Q. And for the first year when the reduction was in effect they were 22,684, a decrease of about 1400 cubic feet?

A. Yes, 1400 cubic feet.

Q. The next year they decreased again from 20,689 in 1899 as against 22,684 in 1898.

A. Isn't that 1900?

Q. No, sir; the year ending December 31, 1899.

A. Yes, 20,689 is the sales per meter at that time.

Q. Now, in 1898, the sales increased 11½ per cent according to this table?

A. Yes; you mean the total sales?

Q. Yes; though the sales per meter had decreased?

A. Yes.

Q. And in the next year the total sales increased 17.3, although the sales per meter had still further decreased?

2707 A. Yes, that is a point I have been trying very hard to make.

Q. In 1898, however, the number of meters increased just about 20 per cent, over 1897, that is, from 3479 to 4127?

A. Where do you get that?

Q. From Exhibit 35.

A. I haven't that before me.

Q. In the year 1899 the number of meters increased to 5308 and the mains increased in 1898 to 64.51 from 57.67 in 1889?

A. *From* 69.42 *to* 64.51.

Q. Would you say the increase of the sales during those two years in Des Moines was due to the fact that the consumers that were taking gas when the reduction was made used more gas than they had been using theretofore, or to the fact that more consumers took gas.

A. Due to both and due to the fact that you are always able to talk a reduction when you are trying to sell.

Q. You said due to both; you had in mind the consumption per meter during that two years was less than it had been prior the preceding two years?

A. Yes.

Q. In view of that, would you say that the old consumers were using more gas?

A. The old meters probably were making up a little bit. I am not talking about consumers of all meters; do you see the distinction?

Q. Yes, I see the distinction.

A. It is this: the total sales increase first is 11.5 and next 17.3 per cent; that brings in the money. It is true that you have to add some money for services and meters, but the aggregate is away up above the million and what you add in the way of services

2708 and meters to the plant is hardly felt.

Q. Why do you leave out mains there?

A. I should have included mains.

Q. And the manufacturing plant?

A. Well, the manufacturing plant usually has a good deal of margin, and more gas does not mean more men, it only means more oil and more fuel, and until you come to a jumping off point of what might be called a new installation——

The MASTER: Right there, if I understood you right, the production of gas reached about 600 million, and that is about 70 million more, isn't it?

A. About 50 or 60 million, anyhow.

The MASTER: 528 million would make it about 72 million?

A. Yes.

The MASTER: I understood you they would have — institute new machinery and a new holder of some kind; is that correct?

A. Just as a matter of opinion, I would say they would have to put in a larger purifier and a larger holder.

The MASTER: I don't remember whether you stated the expense of those things or not?

A. I did not state it; it is very easy to make a rough estimate if you like.

The MASTER: I simply wanted to find out whether you had or not.

A. I would feel almost safe in stating it to you now, if you wish.

The MASTER: I could not recollect whether you had stated the expense of the new installation, whenever it reached 600 million or not.

A. I tried to say that until you reached 600 million, you would not need any additional machinery; what was there would do.

2709 Q. You would also have to put in some new generators, wouldn't you, when you reached 600 million?

A. Oh, no; what they have got there will pull them through on three million cubic feet nicely.

Q. They have now how many generators?

A. One set of 10½ feet and two sets——

Q. What is its capacity?

A. Will you allow me to lump it?

Q. No.

A. The company itself will not fix the capacity of the 10½ foot accurately.

Q. What is the capacity daily of the 10 foot set?

A. Well, I don't know what they fix it at; I should give it myself as a million and a quarter to a million and a half.

Q. Now what is the capacity of the two eight foot sets?

A. In the case of Cleveland they fixed that at a million cubic feet daily capacity for each one of them; the company fixed that.

Q. The eight foot sets a million a piece?

A. Yes.

Q. What is the capacity of the 6 foot 6 set?

A. I am not at all certain that I can recall it. Would you mind letting me look at that catalog you have there. I wouldn't rely on

that 6 foot 6 set. If you will foot this up you will find it furnishes three million and a little over.

Q. In your total capacity you eliminate this 6 foot 6 set and your total capacity would be less than your maximum day?

A. Less than the rate of capacity for a minimum day.

Q. It would be less than your maximum day capacity of any of the three machines, wouldn't it?

A. You understand perfectly—you don't—but people
2710 running those water gas work- understand, that temporarily you can drive them considerably beyond their rated capacity.

Q. Just how much?

A. That, with the aid of the holder, if you had sufficient holder capacity would pull you through with three million a day; if it came on you, you could get through with one broken down.

Q. Do you think it would be a safe proposition to wait until you got to where you had to work your machine over your capacity to get through your maximum capacity, before you installed another machine?

A. I suggested that when you got up to three million a day you got to add more machinery.

Q. Wouldn't good judgment require that you begin to get this machinery in place and arrange for it before it was imperatively necessary to have it?

A. Well, I should say when you got up to about three million the point had been reached you just stated, before it was imperatively necessary.

Q. And you say we are about there now, for all you know?

A. I shouldn't be surprised to hear you were there.

Q. Ordinarily in building a holder the foundation is put down one year and the lift is put on the next year?

A. That seems to be the way it is done.

Q. So that we ought to be making figures on a new holder now?

A. That depends on what you decide from your sales.

Q. Did you see the estimates for the new work for this coming year, or this year that were actually made by the company and were called for by Mr. Byers and which provided for work this year on new holders?

A. I don't remember.

2711 Q. So you don't know that the estimates of expenditures made by the company prior to the bringing of this suit, if my information is correct, show a contemplated expense during the present year on account of additional holder capacity?

A. I did not. The first I heard of it.

Q. Now do you say that the history of this plant shows that the amount of gas consumed by each consumer has increased as the price has been decreased and that that increase has been obtained without additional investment in mains, services or meters and the manufacturing plant?

A. I could not make any such statement as that; I never had

access to figures that enabled me to say whether they would or would not be correct.

Q. You have noticed, have you not, that at the time that the $1.30 rate went into effect the population per meter was 22.72 as against 4.50 now?

A. That is for the year 1895?

Q. Yes.

A. And the year 1910?

Q. Yes.

A. Those are the figures shown on Exhibit 36.

Q. So that while there was in January, 1896 one gas meter for every 22.72 people in Des Moines, there is now one gas meter for every 4.50?

A. Yes.

Q. Do you know of any city situated at all similar to Des Moines which approaches Des Moines in satiation, as you call it?

A. Of course, I never knew until this moment the amount of satiation which existed in Des Moines, I couldn't compare it with other cities.

2712 Q. You haven't any general information that would enable you to answer the question?

A. No.

Q. Now, then, whether or not you can increase your sales depends on this question of satiation and this question of whether there are new uses to which the gas can be put, industrial uses?

A. Precisely. May I explain that—one of the most conclusive proofs that I have ever seen in my life of the enormous increase of sales per capita comes in the form of natural gas which is sold at from 25 to 30 cents and which is sold in enormous quantities in the city of Cleveland, and apparently the point of satiation for natural gas will never be reached; there is a continual fuss going on because they cannot get enough of it.

Q. At a price of 25 cents you can compete with coal and things like that?

A. That is what they do; it is 30 cents there, but even at that there are so many conveniences attached to the burning of natural gas that people are willing to pay any slight excess.

Q. So that in the eastern cities or manufacturing cities where there are large industrial uses for gas you would expect a larger per capita consumption than you would in a place like Des Moines?

A. Provided the price is low enough.

Q. At the same price you would expect a larger per capita consumption in those cities than you would in a place like Des Moines?

A. No, I could not. I will tell you the reason why. One of the peculiarities at Durham, North Carolina, a town of 22,000 inhabitants, there was difficulty with the service; they could not get good service—the consequence was to the surprise of everybody concerned, when they put in cooking stoves the sales per capita

2713 were much larger per white per capita than we anticipated and in making inquiry we discovered it was entirely due to the difficulty in obtaining good service there, and the necessity for

cooking. Now I notice here in this city a very large number of small homes—going around—a few large ones, but the great bulk of them are small homes which look as if they formed the best possible district with a low price for gas and for the sale of gas cooking stoves.

Q. Do you know how many gas stoves have been sold here?

A. I do not.

Q. If you found that more gas stoves have been sold than there are meters, you would think that field had been pretty well occupied?

A. That is a new one; I never compared gas stoves with meters before.

Q. You haven't had any experience in putting in gas stoves or that sort of thing?

A. A very lively one for a short time in Durham; couldn't get them in fast enough.

Q. Now, then, I want to refer for a minute to the revenue per meter; the general tendency of the revenue per meter as shown by Exhibit 36 was at first down, was it not, and since 1895 it has run down some?

A. Pardon me for calling your attention to the important point that the revenue per capita has run steadily upwards as the price has gone down.

Q. Will you answer the question and then we will take up the other matter?

A. Yes, in 1895 the revenue per meter was $30.35, and in 1910 the revenue per meter was $27.33.

Q. Now, then, take your revenue per capita, take the year 1895 and the revenue per capita was what?

2714 A. In 1895 the revenue per capita was $1.69.

Q. Now, then, what was it in 1910?

A. $6.06.

Q. That is less than four times?

A. Slightly.

Q. Now, then, if you take the population per meter in 1895 it is 22.72, isn't it?

A. 22.72.

Q. While your population per meter in 1910, 4.50, that is in 1895 it was about five times what it was in 1910?

A. Yes.

Q. So that if the revenue per capita had remained at the same basis at which it was in 1895, that is among the persons who actually had meters, you would have more than $6.06 in 1910, wouldn't you; it had not kept pace with the decrease of population per meter, has it?

A. Would you mind cutting that question up in two parts; it seems to be two or three questions in one.

Q. If you don't understand it I will try it over again. You note here the fact that the revenue per capita in 1895 was less than it is at present, which of course is obvious, and it is because the population per meter was very much larger for one thing, isn't it?

A. Oh, no sir; the revenue per capita can be gotten independently entirely of any question of meters.

Q. I know, but before you can infer that each consumer is spending more money on account of that increase of revenue per capita, you must go to your population per meter or your increase in meters.

A. I don't care, it is a question of gross revenue of the
2715 company. If your town is increasing in population all the time; if your per capita runs from $1.50 to $6, you are having a bigger and bigger income for the company.

Q. Are you still satisfied that the company, basing it now upon the experience of this company in Des Moines, that the company will get an increase up to 600 millions, if there is a decrease in the rate of ten cents, and that that increase will come in about a year, and that it will not involve any increased capital expenses?

A. I will say, that if the company has not already reached sales of 600 million cubic feet annually that it will within a year or so reach that, after the reduction to 90 cents per thousand cubic feet and that it will be able to do so without any additional expense for mains, but with additional, some additional expenses for services and meters, which will compensate keeping the value of the concern about even as against depreciation—the present value of the concern.

Q. Now, then, how much has the company actually done this year in the way of laying additional mains up to the present time?

A. Of course, I don't know, but yesterday I saw a number of gas mains, it seemed to me lying in an unpaved street ready to go *do* down before the pavements went down; it was on the way to one of the parks.

Q. Would your confidence in your conclusion that it is unnecessary to lay additional mains be at all shaken if you learned that additional mains had been laid since November 31, the date of your inventory?

A. It may frequently be advisable to lay mains where they are not needed at once, where they would not be needed to sell 600 millions; you are getting away beyond that in this town.

2716 Q. You have given us credit for pretty fair management——

A. I have given you credit for being ahead of the game all the time.

Q. If you had learned that the company had in fact been laying mains this year since you made your inventory, you would assume that they were necessary to put the company in a position to take care of the present and immediate future?

A. I would. I would be glad to say though they were unnecessary to get the 600 millions.

Q. Now, then, your computation here based on a 600 million output is also based upon an additional investment?

A. No, additional value.

Q. It is based on no additional investment?

A. It is based on an additional investment in meters and services and no additional present value.

Q. It is based on no additional investment in mains?

A. Yes, I assume that the mains would not be required to jump from 550 to 600 million.

Q. And so far as the manufacturing plant is concerned, it is based on running clear up to the capacity before you take steps to provide any additional capacity?

A. I would call a safe and easy capacity 3 million cubic feet a day.

Q. You didn't call it a safe and easy capacity?

A. I think in my preliminary considerations I mentioned it being a safe capacity for about 3 million cubic feet a day.

Q. You said on your direct examination on page 2349: In my report I called attention to the fact that about three million cubic feet daily capacity of sales was about all that was safe for them to carry; so that your estimate here is predicated upon their reaching their safe capacity before making any provision for increased holder capacity where it is customary to build the foundation in one
2717 year and put up the holder the next, or increase the generator capacity or increase the capacity of the purifying boxes?

A. Always in each case, remembering that I have used the word safe capacity, your statement is correct.

Q. Now, I want to ask you about something else in this same connection in this table set out on page 88 of your report; it appears that the output for the year December 31, 1907, was 15.4 per cent more than the output for the year ending December 31, 1906, that is right, isn't it?

A. It so appears.

Q. Now then, that is a greater increase than you figured here to get your 600 million, a greater percentage increase?

A. Yes.

Q. Now will you turn to Exhibit 24 and see whether the actual experience of the company verifies your assertion that such an increase would only amount to the cost of oil, labor and so on, by the actual Pers.

A. Spell Pers.

Q. P-e-r-s. That is a technical expression with the gas people.

A. It is indigenous to Des Moines, I believe.

Q. Turn to page 83 of your report—your figures are about the same—you find the total cost per thousand in the year ending February 28, 1907, was 64.90?

A. 64.90.

Q. And your total cost for the year ending February 29, 1908, which includes this big increase of about 15.4 per cent is 63.50?

A. So stated.

Q. Now there is a difference of a cent and a half per thou-
2718 sand?

A. Yes.

Q. According to your own figures, how much of an increase does that cover at 15.4 per cent?

A. This figures 31,658,974 cubic feet.

Q. These figures I call your attention to on page 83 are the figures which are made up, as you stated, by the City's experts and carefully checked by you before you adopted them?

A. Gone over by me and examined.

Q. Didn't you tell us before you adopted them you carefully went over the matter so that you were satisfied they were right?

A. About right on an average, yes.

Q. That does not indicate that your theory that the increase in the amount of sales involves only an increase of about 25 cents a thousand?

A. It does for this particular step: from 530 million up to 600 million.

Mr. BRENNAN: That question is objected to as being argumentative in form.

Q. Let us get at it in another way. For the first year there are shown at page 83 of your report the operating cost thereof 64.90 the full year?

A. Yes.

Q. For the last full year, 65.30 which includes 3 cents in the disputed item?

A. Yes.

Q. During that period what was the per cent of increase in the amount of sales?

A. I cannot get that, because this tabulation on page 83 ends February 28, 1907, and the tabulation on page 88 ends on December 31, 1907, you see.

2719 Q. You can get at it approximately, can't you?

A. I should think, rough work, yes. In 1910 the total sales appear to have been 531,990,000 and in 1907 the total sales appear to have been 429,519,000; the difference is 102,472,000; dividing that by 429,519,000 gives about 24 per cent increase in the period elapsing between December 31, 1907, and December 31, 1910. The figures on page 83 do not correspond exactly because the year that ends February 28, 1907, and gives 64.9 per thousand feet cash operating cost, anticipates December 31, 1907, by ten months. The year ending December 31, 1910, and giving 65.31 coincides with the 531,991,000 sales.

Q. So that so far as the record in this case goes at least, in order to sustain your figures you will have to anticipate a condition that has not heretofore existed in the experience of this company, or a result that has not heretofore existed.

A. No, because at 600 millions I have given you the total cost amounting to 64 and a fraction cents per thousand cubic feet sales.

Q. In order to get that you put in six cents depreciation on the 531 million sales which were not any of the figures on page 83?

A. I put in all through six cents for residual depreciation.

Q. Turn to page 96—528,375,000 under operating there, you took 69.33 cents which includes six cents depreciation?

A. Yes.

Q. That includes six cents depreciation?

A. Yes.

Q. And you did not figure any depreciation on the other 71,625,000?

A. The reasoning for that is very simple.

Q. I asked you for the fact?

2720 Mr. BRENNAN: I think he ought to have a chance to explain.

A. I did not figure the depreciation on the increase and for this reason: that 528,375,000 cubic feet at 69.33 cents covers under the existing conditions not only the cash operating cost but also the existing residual depreciation, and would at that rate cover it without any question whatsoever from anybody. If however, by the lowering of the price, which is done of course, without in any way modifying the works, the sales jump up to 600 million cubic feet, your depreciation would be taken care of for that time and the only thing that would befall you would be the necessity of at once increasing the amount of coke and oil and perhaps the amount of purifying material and attention to it, because you would have to purify more rapidly, and in that way nothing would be disturbed in the regimen of your works at all.

Q. To get back, you get your 64 cents and you already put in six cents per thousand feet on that 528,375,000 in the computation on page 96, which gives you the gross operating 584,228?

A. Yes.

Q. And that six cents is not included in the operating cost shown on page 83 from which you made your comparison?

A. That six cents is not in page 83, because that is the cash operating cost.

Q. So that to make the comparison fair you would have to compare 63.33 plus 6 or 69.33 with 64 to get at the difference you figure here, wouldn't you?

A. Put it this way if you like.

Q. Please answer the question?

A. That would be it.

Q. In other words, you figure a decrease of about five cents

2721 per thousand?

A. Which would be what I think would happen.

Q. You did not figure any increase in operating on account of additional meters and on account of additional services?

A. Not for that step of about 10 per cent, you would not know it in your labor in the works or the labor in the office.

Q. Still our aggregate is made up of very small things, none of which you would know alone?

A. Well, that is too general; I couldn't answer that question.

Q. Well to summarize this, in order to get your figures as to your return here, it is necessary for you to take the figures which result in making the cost per thousand of the gas about five cents under the average of the last five years?

A. You mean—I see what you mean, although you haven't stated it. You mean and include residual depreciation?

Q. Certainly; or if you exclude it in one, exclude it in the other; it don't make any difference as long as you don't put it into one and take it out of the other.

A. Taking it either with or without residual depreciation it would appear to me that the result running from about 531 million to 600 million would be a reduction in the cost of gas of about five cents per thousand cubic feet, giving 64 cents as the cost of gas delivered at the consumer's meter in this case, as against 69 cents heretofore.

Q. Now I want to ask you one or two questions about working capital. You allowed us 13 cents per thousand on working capital, based on some experience of somebody in a Massachusetts Company, as I understand it?

A. Based on careful consideration of what Massachusetts companies seem to do.

2722 Q. What Massachusetts company did you take into account?

A. No one in particular.

Q. Which companies did you take into account?

A. All of them, the whole of them, looking them all over.

Q. You couldn't tell that it is 13 cents a thousand by just taking and looking at them, this is based on figures?

A. I made a lot of figures; after all, you may say I didn't use them in so indeterminate a matter as the working capital of an operating company.

Q. Did you take this for the year 1910 from the 1910 report?

A. What, working capital?

Q. As a matter of fact, what you are giving us here is what you gave them in the New York case?

A. No, I haven't given you anything here, not except the 13 cents.

Q. Didn't you testify in the New York case: "If we subtract the total of these floating liabilities $637,165.66 from the working capital $852,249.94 we obtain $215,084.28 being the active capital furnished by the stockholders for the ordinary needs of the gas business. If we divide this amount by the total annual sales 1,653,012,30 cubic feet we obtain $0.13 per annual M sold as the amount of capital actually and practically necessary on the part of these Massachusetts companies." Did you say that?

A. That sounds like it, but I have not used that method in your present case today.

Q. Tell us what companies you used here?

A. All of them.

2723 Q. All of the Massachusetts companies?

A. Yes.

Q. For what years?

A. That would be very hard to say. I looked at a number; there was no definite work done. I can give you the working capital in items.

Q. I prefer to cross examine along my own lines. You say in your report here from my own investigations of the working capital of the Massachusetts Gas companies, which I deemed to be well

managed, I am led to believe that 13 cents per thousand cubic feet is all that is practically needed. Now then that statement is true, isn't it?

A. That is correct.

Q. That is the basis that you have for your conclusion here?

A. That was the basis of my conclusion many years ago; that has *sin* since been modified, but the conclusion has not been changed.

Q. You stated that your investigation of the working capital of the Massachusetts companies is what led you to believe that 13 cents is right, is your investigation what led you to that belief?

A. What led me to that belief; not what confirmed me to that belief.

Q. What companies did you investigate?

A. I don't recall, there were four companies, in 1906 or 1907; I haven't made up your working capital in that way at all.

Q. Can you give me the names of the Massachusetts companies which you investigated in order to reach this conclusion?

A. The effort of memory would be too great; I haven't even taken the trouble to revise for the purpose of getting your working capital.

2724 Q. How recently did you make this investigation?

A. Which investigation?

Q. The one you refer to here, which led you to conclude that 13 cents was a fair amount to allow.

A. I think it was in 1906 or 1907, I don't know exactly.

Q. Was it prior to the testimony in the New York case?

A. Even that I can't recall; I know it was in the New York case; There was 15,000 pages of testimony in that and 2,500 pages of exhibits.

Q. Then you do not have any idea what companies those were on which you based this conclusion—now then in the consolidated case, do you remember what companies you took?

A. I couldn't recall it.

Q. You made a running guess at it?

A. I didn't care to look at it even.

Q. Now, when you made your computation here did you include the materials on hand?

A. That was what I worked out here, a certain amount of materials on hand and a certain amount of cash.

Q. And did you figure that we had to wait a month and a half for our receipts for gas?

A. How about your quarter meters?

Q. We don't have to wait so long on them.

A. I would like to give you the working capital, if you will permit me to go ahead.

Q. I see you are rather evading the report here. I want to *to* get you down to brass tax; you say you got this out of the Massachusetts computation?

A. I did.

Q. Will you say that the working capital of the Massa-

2725 chusetts companies in 1910 as shown by the 1910 report of the Massachusetts Commission amounts to only 13 cents per thousand cubic feet of sales.

A. I will not.

Q. Will you say it amounts to less than forty cents per thousand cubic feet of sales?

A. I will not; I have not investigated it.

Q. So that the statement in this report as to how you got this 13 cents is not to be applied to any existing condition in Massachusetts?

A. I don't know. I will tell you very frankly, I did not look into it at all.

Q. I am assuming what you say here is true. You say on page 82 from my own investigations of the working capital of the Massachusetts gas company which I deemed to be well managed, I am led to believe that 13 cents per thousand cubic feet is all that is practically needed. I assume that statement is true?

A. It is.

Q. You also say that investigation is so ancient that you cannot say whether an investigation made now of existing conditions in Massachusetts would verify it.

A. I can say that there is also another statement of about 30 cents there which is equally ancient.

Q. You did not adopt 30 cents in order to be entirely fair to us; you took 13 cents?

A. I took the 13 cents.

Q. That is because you wanted to give us the benefit of the doubt?

A. Always.

Q. Now you go on further—coming to figures I find the necessary working capital for the profit of the Des Moines Gas Company
2726 about 68,689 which results from the multiplication of 528,375,000 by 13 cents; is that the way you got it, or is this statement not correct?

A. That is the way I got it.

Q. You haven't finished the idea as to where you got that 13 cents; you can't remember, can you?

A. You mean originally?

Mr. Byers: I think, your honor, that has been fully explained.

The Master: I think he has answered this question.

A. I got it as a constant or average result of a considerable amount of work fixed at 13 cents in my mind and trying it on this carefully and checking out and making a list of what things were required in the working capital and finding that checked out about 68,000 I let it go at that.

Q. Have your expert accountants told you what the actual average working capital of this company has been for the last five years?

A. They have not.

Q. You don't know whether it is two or three times what you have got here?

A. I have heard the testimony here—you wanted $150,000 working capital, something of that sort; that is all that I have heard.

Q. Well, now how much in making up your working capital would you think the store room supplies would ordinarily inventory, what would be a fair amount?

A. For this concern about $8,000.

Q. About $8,000?

A. About what you would need to carry in the way of samples, and fixtures for sale, service pipe material and necessary emergency material.

2727 Q. Would your judgment on that be affected any if I should tell you that the actual amount on the 28th of February 1907 was $82,978.83 and in 1908 $76,492.07 and for the year 1909 the same date, $53,701.38 and on the 31st of December 1910, $40,251.89?

A. Not as to the actual necessity of having that on hand.

Q. You think the management here is not good then in this respect?

A. I don't know; I am talking now about what is actually needed for working capital.

Q. In this respect you did not require or regard the actual results as shown by the books as valuable?

A. I did not.

Q. What did you give us for store room supplies?

A. About $8,000.

Q. What would you itemize that?

A. About $3,000 for fixtures for sale and $5,000 for service pipe material and necessary emergency material, such as you have to have in the work shop underneath the main office.

Q. That is all you included there for the store room?

A. Only samples and odds and ends.

Q. You have got just two items, emergency supplies, services and fixtures and that is all the matters you took into account?

A. Yes.

Q. Now, then, for the stock of tar, how much did you allow us?

A. I thought you might be able to hold on until you got a thousand dollars worth of tar in your well.

Q. Do you know what that is, the average for the last five years?

A. I do not. About two cents a gallon; you know, fifty gallons to the dollar.

Q. Where would we have to get it?

2728 A. You mean sell it?

Q. Where do you have to sell it?

A. There is just one concern in the United States that seems to buy it and they don't want very much of it. I think it is Barrett in Cleveland, Ohio.

Q. How much tar do we make to a thousand cubic feet of gas sold?

A. Water gas?

Q. Yes.

A. I don't know.

Q. What I was getting at is how many dollars' worth of supply of tar do you think we would have to have there?

A. I thought 50,000 gallons was about where you would have to get rid of it.

Q. You can't tell us about how much tar we ought to get out of a thousand cubic feet or a million cubic feet?

A. No, not oil tar.
Q. Didn't they do that at Durham?
A. No, that is coal gas.
Q. Nor at Fostoria?
A. They did at Fostoria; you was not sure what kind of oil you were putting in and so you did not know what kind of tar came out; none of your experts can tell you.
Q. Now, then, what did you allow us for the gas stock?
A. What do you mean?
Q. I use it in the ordinary sense it is used.
A. I thought you had to have oil on hands, about 300,000 gallons and allowed about $9,000: that would carry you a month.
Q. That is what they mean by gas stock in gas book keeping?
A. I am not a gas book keeper; tell me what you mean.
Q. Gas in the holder?
2729 A. Why didn't you say so. Gas in stock is all right, but you got it mixed.
Q. How much did you allow us on account of gas in the holder?
A. Not a bit.
Q. We always have an investment in that, don't we?
A. Yes.
Q. How much did you allow us for boiler fuel stock?
A. Coke and coal on hand?
Q. I don't mean that; I mean boiler fuel.
A. I didn't separate it; I put coke and coal on hand anywhere from $5,000 to $10,000.
Q. Would you be inclined to modify that at all if you learned that in the last five years there had been no time at which there has been as little as $10,000 of coke or generator fuel stock on hand?
A. No, because $10,000 at the outside is all you need for safety; what you need for commercial reasons is a matter of balancing the cost against the investment.
Q. Where do we have to get our coke?
A. I don't know.
Q. Isn't that a factor to be taken into account?
A. That is the reason I made it an indeterminate quantity from $5,000 to $10,000.
Q. That includes also boiler fuel?
A. It includes boiler fuel.
Q. You don't know how much you included for any one?
A. I should say four-fifth- and one-fifth; your coke costs you $5.89 here doesn't it.
Q. I don't know.

At this time and adjournment was taken until 1:30 P. M.

2730 1:30 P. M. TUESDAY, *August* 22, 1911.

WILLIAM D. MARKS continued on cross examination by N. T. Guernsey, Esq., testified as follows:

Mr. GUERNSEY: Complainant offers in evidence the chart marked complainant's Exhibit 41 and the papers marked Exhibits 42 and 43 which are the figures used in connection with that chart.

Mr. GUERNSEY: Mr. Brennan did you get that letter of Professor Marks' of February 7th?

Mr. BRENNAN: I have not had a chance to see the Mayor, he has been out of the city, I expect to see him this evening if he returns to the city.

Q. Now Prof. Marks I think the last one you gave us was boiler fuel and generator fuel. Now take the other items that you take into account in making up this capital account, working capital I mean.

A. Oil, 300,000 gallons $9000. Cash on hand at the beginning from $40,000 to $45,000. Total $68,000.

Q. Those are all of the items which you included?

A. That is it.

Q. Now take Fall River, will you take the report for 1910 for Massachusetts and tell us how we would find the actual working capital of that company there from that report? I did not ask you to work it out, unless you prefer to, I just asked how we would get it?

A. I would like to go over this pretty thoroughly.

Q. All right, I have no objection, only I didn't want to be responsible for the time.

A. Do you wish what I would give them as working capital
2731 or what you think they have got as working capital?

Q. The question was how you would ascertain from the report what their working capital was?

A. You mean what is the actual value, not what I consider necessary?

Q. Certainly. I didn't ask you to compute it, I simply asked you what method you would adopt to ascertain from the report what their working capital is.

COURT: Can you answer without taking up so much time?

A. I am just through. Looking over the balance sheet of the Fall River gas works company I find amongst its assets the following, the quick assets, due for gas $22,604. Gas coal on hand $5,552. Tar, $5,602. Meters on hand, $6,276; other material not specified $47,356; stoves $4,446; fixtures $1,098; sundry accounts due to the company $11,743, making a total of $104,577 if I have footed it correctly. Now I find on the other hand amongst the liabilities the unpaid bills $13,607, the assumption being that these unpaid bills are covered in the assets above stated, deposits from consumers $5,171, that is cash in the hands of the company for any use that they choose to make of it and amounts due from the company which they should pay out $8,697 or a total of $27,475. The difference between $104,577 and $27,475 is $77,102. Now they have

on hand cash to the amount of $127,406 making $204,508 available liquid assets.

Q. Well the actual working capital is shown by this report isn't it?

A. What they use there, yes; of which $77,000 is invested and the rest is in the form of cash.

Q. So that their actual working capital is about 41 cents a thousand cubic feet, their sales being 495,612,000.

2732 A. That depends on the matter of cash.

Q. It depends on how often their sales will go in $104,508 which was the actual working capital.

A. Also on whether that $127,000 in cash there was actually needed or not.

Q. I am not talking about what they needed, talking about what they had?

A. That is what they had.

Q. That is about 41 cents a thousand cubic feet of gas sold?

A. I have not the number of thousand cubic feet of gas——

Q. It is under 500 million, 495,612,000. Five hundred million would give over 40 cents?

A. Yes, sir.

Q. So 41 cents is near enough right?

A. Forty one cents is near enough right I should say, or 40 cents anything of that sort.

Q. On page 58 of your report you have depreciated the services 15 per cent have you not?

A. Yes, sir.

Q. On that page just below that you say it is customary to reckon the life of wrought iron services at about 15 years?

A. Yes, sir.

Q. Who reckons it at fifteen years?

A. The last instance I can recall is the chief city engineer for the city of Minneapolis who testified that fifteen years was the average life of wrought iron services in the city of Minneapolis and as the soil there seemed to be about the same as it is here I thought that would be about the life you could expect here for the untreated services.

Q. I know, but you say it is customary. Did you predicate

2733 this statement that this is customary on this single instance?

A. Oh no.

Q. Who else?

A. I have heard that before again and again.

Q. Well where?

A. I think the first time I heard of that was in St. Louis forty years ago where that statement was made in a case of purchasing a lot of old gas mains from the old St. Louis Gas Co.

Q. Did you predicate your statement that that is the present custom on that statement you heard in St. Louis?

A. No. In fact I think I state below there that if they are tarred a longer life is given to them.

Q. Are these services tarred now?

A. They seem to be tarring them now.

Q. How long have they been doing it?

A. I don't know. I know that the probabilities are it has not been very long.

Q. Just to give the company the benefit of the doubt you depreciated them all as if they had not been tarred?

A. No. In referring back to the testimony given in 1894, I can't recall the name of your engineer in charge at that time, but I think it was Pratt, he took 2500 services as in existence at that time and he further valued them on a basis of an average of 35 feet to the lot line or house line. In other words stated that about thirty five feet was the estimated average length of your services anterior to 1894. And how far or how long you did—how long you kept it up between 1904 and 1910 I had no means of finding out. I took it for granted that particularly anterior to 1894 the services that had been put in would probably have to be replaced, in other words that there would be very few of them, I am talking
2734 in averages, of your 2500 left that were in at that time, they would be replaced one way or another charge for repairs. That would cut your services down to about 14,500 something like that, that might by some possibility be 80 feet long.

Q. What has this got to do with depreciation and tarring of the services?

A. Now since that time, since 1894 I took it for granted that all of the services had been practically been put in new. That is speaking in averages and that 1894 to 1911 gives you about fifteen years and about half of that life was seven years, seven years and a half something of that kind would be somewhere near an average life of your services giving you the advantage of a year or two as I have tried to do.

Q. You mean age instead of life don't you?

A. That *is* not depreciate you as much as I would if it was eight or nine or ten years of age instead of seven and a half is what I am getting at.

Q. If as a matter of fact services last longer than fifteen years then of course this depreciation is too great?

A. Not necessarily because I heard from your testimony, I happened to *ge* present and hear that—I forget now I think it was Mr. Lea's testimony that you put yo- services about eight years of age and life about 20 years and then I found Exhibit 8 which you sent in here and from which the data were obtained for the various reports you have turned in apparantely and there it was carefully computed at I think about eight years of age.

Q. (Question read.) That is true isn't it? You have taken this depreciation on the basis——

A. As a matter of age seven and a half to twenty five——

2735 COURT: I wish you would answer the question we will never get through if you don't.

A. I should say so yes.

Q. The Wisconsin Commission takes 25 years as the life of services don't it, for the purpose of figuring depreciation?

A. That I don't know.

Q. If your theory is right here, of course the services in Des Moines must have been renewed within a very short time, is that right?

A. Fifteen years.

Q. If they had only been renewed within fifteen years that would give them an average age of seven and a half if the number had been uniform all the time.

A. Yes, sir.

Q. And of course the number of services have been increasing as the output has increased, you take that into account?

A. Yes, sir.

Q. So they must have been renewed much less than fifteen years the whole thing put in if your theory about the average age is right?

A. Not all of them, but on the average they have been renewed in less than fifteen years.

Q. Of course if it turns out that our services have a life longer than fifteen years, then this depreciation is too great?

A. As a matter of age, that might be correct.

Q. Now did you ever lay any services except in Durham, Fostoria and St. Louis?

A. No.

Q. Who told you what the costs were?

A. In what way are you speaking of now, the costs per
2736 foot?

Q. Well how ever you did it.

A. It is given in my report here very carefully and in detail.

Q. Who gave you the figures so as to get what you put in?

A. First the ordinary price list of some local company here for inch and a quarter pipe gave me 5.7 cents as the net cost per foot of inch and a quarter pipe, I don't know that all your pipe are inch and a quarter but I gave you the benefit of the larger size. Carting, fittings and miscellaneous 4 cents is my own estimate. Labor ditch, etc., I have already explained to you I priced there a good many places as to the cost of ditching, I took that at ten cents, making a total of 19.7 cents. The average cost per foot length I take at about 20 cents, again somewhat swelling your figures. I had accepted your figures of 80 feet long for new services. Of course I did not—I ought not to use the word accept for I did not accept it. I made use of it as the only available figure and took 80 feet which gave $16.00.

Q. You run your carting, fitting and miscellaneous for inch and a quarter service higher than you do for three inch cast iron main don't you?

A. That is one of those jobs that the only way you can get at it is by knowing about what actually does happen and I found it to ve so.

Q. Where did you get the experience of what actually does happen?

A. I think I got most of it in Durham along about 1900, along about there.

Q. I suppose you have not kept the figures?

A. Oh no.

Q. Now turn to meters, page 60. Did you ever buy any meters since you left Durham?

2737 A. No.

Q. Ever buy any except at Durham?

A. Yes, sir.

Q. Fostoria do you mean?

A. Yes, sir.

Q. They had not been bought before you went there?

A. Some had and other- had not.

Q. That the extent of your experience in buying meters?

A. Had a very large experience in the early days, happened to fall one of my jobs to look after meters awhile.

Q. Same kind of meters as this?

A. No, the old wet meters.

Q. Not the same price as these?

A. No.

Q. Where did you get your prices on meters you used as a basis?

A. This here I got in Cleveland.

Q. Who told you about them?

A. I took the statements of Walter K. Sladden.

Q. Who is he?

A. He is now secretary of the Cleveland Gas Light & Coke Company and Mr. Edward Wormington who was formerly manager of the People's Gas Light Company of Cleveland.

Q. So what you know about prices of meters is what these gentlemen told you?

A. They made oath to it before the tax commissioner.

Q. Trying to cut their taxes down were they?

A. I don't know I suppose it was something of that sort. They did get them raised though as a result.

Q. Now then these prices, take a three light meter $4.35 is that the price you charge for our meters?

2738 A. No, you will observe I gave you the additional of 15½ per cent below, do you notice it on page 61. I add 15½ per cent to cover 33 per cent discount instead of 42 per cent discount assuming that the U. G. I. of Philadelphia might not be willing to use its influence directly and without some compensation. It places your meters at 33⅓ off.

Q. Have you any reason to assume as you do here or insinuate that the U. G. I. Company buys meters at one price and sells them at an advance to the Des Moines Gas Co.?

A. I feel tolerably confident of it because in the case of the generators here for instance I assume $60,000 where the U. G. I. of Philadelphia manufactured these generators and in all probability delivered them to the U. G. I. at Des Moines at the same rate that they would at Cleveland or some outside concern.

Q. Now if I can understand you get the idea out of the words

you infer that the U. G. I. sold to the Des Moines Co., generators at the same price at which it would sell them to anybody else.

A. I base my figures on that yes.

Q. Upon that inference you infer that they bought meters and sold them to the Des Moines Gas Co. for more than they cost to the U. G. I. Company, is that right?

A. I would not put it that way exactly, but I have very little doubt being as old as I am that the U. G. I. is in control of meter factor-s, own stock of them perhaps not appearing on surface.

Q. Now what definite knowledge have you for that statement, I want to know just how careless you are in your statement, how much you have to have in the way of facts in order to swear to it because you are under oath now. Now what definite information have you as a basis for your statement that the U. G. I. Com-
2739 pany controls some meter manufacturing company from which these meters are purchased if you know?

A. I have no legal proof of any sort or kind in regard to that matter. I have heard talk with regard to that matter which leads me to believe that they called their usual policy of controlling—I am not speaking of this in a derogatory way. Their manufacturing department deserves its profit and so I give you 33⅓ off.

Q. What meter company is it you claim they control?

A. Well suppose we don't go any farther, I have given you 33⅓ off.

Q. I want to go farther and see if you know anything about it or whether it is just hot air. What meter manufacturing company is it you say you have reason to believe the U. G. I. Controls. You have brought this thing in, now let's follow it down.

A. I don't propose to say anything more than I have said.

Q. Have you the fainterst idea that it controls any meter company?

A. I have very distinctly stated that I have a very strong feeling that it does.

COURT: You don't know anything about it as a matter of fact?

A. I have no proof except heard talk that has come to me.

Q. Now can you name one person that has said this to you?

A. I certainly shall not mention any.

Q. Can you name one person?

A. I certainly shall not do so.

Q. I have not asked you to do so, I asked you whether you could.

A. Name a good many if I wanted to.

Q. But you don't want to have us run it down is that it?

A. I don't care to go any further into the matter.

Q. I should not think you would. Give us the names of
2740 some companies that manufacture meters.

A. Oh I am not posted on that at all.

Q. Can you name one?

A. If it has not changed its name we will call it the American Meter Company.

Q. Where is it?

A. Was located for awhile in Philadelphia.

Q. And can you name another, is there any that is nearer this market?

A. No.

Q. Can you name another company that manufactures meters in the United States.

Mr. BYERS: I think that question was all covered two weeks ago or several days ago.

A. I mentioned one to you, that is sufficient.

Q. Do you know of any others?

A. I have talked to Mr. McLehaney in regard to meters quite frequently.

Q. Do you know of any other company that manufactures and sells meters?

A. Mr. McElhaney of Philadelphia, McLehaney Brothers.

Q. Are these prices $4.35 for three light prices f. o. b. cars in carload lots at Cleveland?

A. So stated.

Q. That is all you know about it?

A. That is all.

Q. Now then you took these prices these men down there said they were paying and they said they were getting 42 per cent discount?

A. They did.

Q. From this price, $4.35, was it?

2741 A. Oh no, these are net prices.

Q. What per cent of these prices did you charge with this?

A. I carried it to 33-1/3 per cent, carried it working through there.

Q. You made the discount from the cash price or from the list price 33-1/3 per cent?

A. No, I did it this way if you like.

Q. I want to find out how you did it.

A. 42 per cent, that leaves 58 per cent. If you multiply 58 per cent by 15½ per cent you will get about 67 per cent. Multiply 58 by 15½ and then add 58 to it?

Q. You mean take 115½ per cent of the 58?

A. If you choose to put it that way.

Q. That is a fact isn't it?

A. Yes, sir.

Q. That is the way you made it up?

A. Yes, sir. Took 15½ per cent profit if they were sold at 42 off.

Q. And that would pay for the meters on the car in Des Moines you think?

A. I think so.

Q. Less freight?

A. The freight is all charged in you know below.

Q. This item does not include the freight?

A. No.

Q. It is f. o. b. the cars Philadelphia then?

A. Philadelphia or wherever they are manufactured.

Q. Not at Cleveland. Now then you allow per meter $1.00 for furnishings settings connections and so on?

A. Total 19,742 meters furnishing, etc., $1.00, $19,742.00.

2742 Q. What does freight, etc., cover.

A. Oh take about 50 cents of the dollar for getting the meter in position and the balance of it is handling, for carting it around and fr-ight on it.

Q. Well it covers the expense that is incurred in connection with the meter from the time it leaves Philadelphia or wherever you buy it until it is in place in Des Moines?

A. Yes, you might call it the handling of the meter, in other words.

Q. When you get the meters here at Des Moines what do you do with them first?

A. I suppose the first thing they take them up first and stack them up.

Q. Put them in the store room?

A. Yes, sir.

Q. Then what is it necessary to do?

A. Well if they are not sealed, that is authoritatively sealed, I suppose they test them. If they are authoritatively sealed by the city, I don't think there is any public inspector here who has to seal them.

Q. When you say authoritatively sealed you mean sealed by whom?

A. By the public inspector.

Q. Do they have public inspectors where they get these meters?

A. No, I meant here.

Q. The public inspector here would not seal the meters if there — one, I guess there is not, without testing them I suppose?

A. Yes sir.

Q. So they must be unloaded, take- to the store room and tested, that is the first?

A. One minute, if there is not an inspector here you know

2743 the *com-* company would be very likely to accept the meter test of the meter company as being probably better than anything they could get done.

Q. As a matter of fact the company don't take the test, does its own testing. Now then what would be the next step?

A. With the meter?

Q. Yes, sir. Do they put a tag on it with a number?

A. I presume so. I don't know how they card their meters here, what system they have about it. Of course they keep track of them in their own way. May be they paint a number on them.

Q. What do you mean by dipping meters?

A. Do I say anything about it?

Q. No, but I see it on this memorandum I have and I am not an expert in the gas business, I don't know what it means and thought you could tell me.

A. I don't know what they mean by dipping meters unless they mean to paint them.

Q. Then I don't believe you know much more about that than I do.

A. Not their way of talking about it.

Q. Do you know what dipping a meter is?

A. I don't know it by that name.

Q. Is that an ordinary trade name in the kind of meters that are in use here?

A. I don't know. I simply know what your meter is here, it is a dry meter on the operation of a bellows having a valve movement which is operated by these bellows which move to and fro and these bellows composed of I suppose tin, with a sheepskin preferably, an oil soaked sheep skinned diaphragm.

Q. When the meters come here, do they have this oil in them?

A. Not usually.

2744 Q. And do they call meters that have oil in them so that this sheepskin dips in the oil as the bellows expands, dipping meters?

A. I never heard that name used at all as dipping meter, it is some localism like something else you mentioned a little while ago, the per. You have to keep your diaphragms oil soaked, you can't work a meter—the trouble with a meter is the diaphragms dry up.

Q. How long do they have to be soaked with oil?

A. Supposed to have all the time.

Q. And how often do they put this oil on to them?

A. Oh you have got me. I never bothered enough about meters to find out. If it don't work right the meter maker is expected to make it good. I could not tell you to save me anything about how often they dip a meter as they call it.

Q. Did you ever hear of a meter that had a receptacle in the bottom for carrying some oil so automatically the diaphragm dipped itself?

A. I never paid enough attention to the mechanism of a meter to be posted on that.

Q. And is it meters of that class that we are using here in Des Moines?

A. You have a most elaborate table for that purpose and it is mentioned in your inventory list, can be seen in your meter building having a number of compartments for oil and that sort of thing, but I did not pay much attention to it, wasn't a very big thing.

Q. Do they mean by dipping meters putting oil into this receptable in the bottom of the meter so when this meter operates this diaphragm will oil itself?

A. Well if you were in New England they would call it

2745 oiling a meter I suppose in Des Moines call it dipping a meter and I suppose the Pacific Coast might call it greasing a meter, I don't know.

Q. You don't know do you?

A. No.

Q. Just drawing on your imagination again. That is something that a meter of this kind has to have done before it leaves the store room isn't it?

A. I don't know whether you do it or not.

Q. Now then what do you do in the way of additional work on this meter before it leaves the store room?

A. I suppose you unwrap it.

Q. What else?

A. I never looked one of them over. Fix it up I suppose so you can hook it into your union joints. Union coupling and I don't know whether you use lead connections or whether you hang it up on union co-plings, I didn't take the trouble to look.

Q. You did take the trouble to estimate all this didn't you and give us about 50 cents for it?

A. For what?

Q. For this work we are doing on the meter.

A. It was very important that the court should know about what the average expenditure was connected with this thing.

Q. You estimated expenditures without knowing what they cover.

A. I can hardly say that.

Q. What soldering is done in the shop before a meter is taken out?

A. A new one?

Q. Yes.

A. What kind of connection do you use, do you use a union joint coupling or hang it up by the wrought iron service.

Q. Well take what you estimated?

2746 A. I didn't look it over to see.

Q. You estimate here $1.00 per meter covering the entire cost for each meter on 19,742 meters from Philadelphia to their place in the house?

A. That was handling meters.

Q. Where have you estimated these additional items of cost?

A. When you put your service in you hook your meter on.

Q. You have down below the next line total delivered and erected for operation $163,594. Does that cover the delivery and erection of the meters?

A. With the exception of what you spend on services running it up to it.

Q. That is not part of the meters, that is services.

A. Well the service goes into the meter, take it either way. You can say part of this cost—you can say the meter connected with the service or service connected to the meter, whichever way you choose to put it.

Q. How did you estimate it as a matter of fact?

A. In the case of the meters here I concluded that the service would cover about all up to this point here where I gave you 15½ per cent to cover 33 per cent discount instead of 42 and then gave you overhead charges of 12½ per cent and reached an outside structural cost of $212,570 by first adding 15 per cent and then adding 12½ per cent and let the rest go with the service.

Q. You told me a little while ago that your $1.00 covered the total expense of the meter fro- the time it left Philadelphia until it was set up in the house. Now if that is not true tell us just

waht part of that expense you included in your estimate of the services.

2747 A. I tried to make that clear to you by saying I think it meant handling of the meter from the time it started out of Philadelphia or whatever place you started from until it landed in the place where it was intendee to work. In the meantime you have your meter department going on here which is 12½ per cent on top of that. Then in order to be sure to be on the safe side I added 12½ per cent giving you the ordinary discount of about one third off.

Q. That don't answer my question. Can you tell what items are included in that dollar or turn it around and what items in connection with meters you now classify as services.

A. I don't classify anything with services as meters unless you get it getting up the meter connection.

Q. You send a man out to set a meter, do you call that service or not.

A. No, I call that as I said to you about 50 cents.

Q. Now we have a man that does some work on a meter in the storehouse do you call that service or not?

A. I call that 12½ per cent.

Q. That is overhead.

A. Business of the meter room is overhead charge there.

Q. Then you didn't figure overhead on the actual cost, you put actual cost into the overhead, that is right isn't it, if what you say is correct?

A. That is a little bit fine for me, I thought that about 12½ per cent would cover what you had to do on the meter in the way of extra tests, attention and everything of that sort inside the meter department.

Q. That is in your overhead?

A. Well maybe I used the wrong phrase, when I said overhead, I didn't mean I included any part of the present salary in

2748 the care of meters or anything of that sort.

Q. You can't tell us can you what it is necessary to do from the time a meter is received in Des Moines on the cars until the meter is in place in the house?

A. I can if you would like.

Q. All right I would like it very much, just tell us and tell us in the order in which it is done.

A. First of course you know the meter is stored in this room. Then if you do not have a public tester or inspector and if you have any doubt about the meter being properly tested where it was bought or about its being possibly thrown out of adjustment on the way you test it. If this test comes out all right your head of the meter deparment, whoever he is, has a card, he also has a card catalogue. The card slips into a place prepared for it on the meter being properly marked so it can always be identified by anybody that takes it out. Now if you want to use the old fashioned lead connections there is a certain amount of soldering has to be done in making lead connections or put it on the shelf. The shelf stands like that, is

fastened in the cellar and has side pieces here holding it up against the cellar wall. Of late years, it is a little risky, but of late years some prefer to bring the wrought iron service in and put in the necessary bends and union joints and hang the meter by the inlet and outlet right over the shelf or on the shelf. If that is not done carefully and careful not to get the meter out of level you might strain it. Reading of the meter is taken in the ordinary meter book. When that is done it is turned over to the ordinary inspector and the stop cock is turned on and I presume you are through with the meter until you bring it for repairs I think that is the history of it.

2749 Q. What material is furnished—you have a stop cock?

A. Meter cock you mean.

Q. Yes, meter cock, I think you called it stop cock a minute ago, brackets and shelf?

A. There is no brackets just a wood shelf.

Q. What does the shelf stand on?

A. It is on the wall like that and a piece comes down here and a piece comes down here and fastens to the wall. That is the cheapest thing you could get.

Q. What else, how much pipe and that sort of thing.

A. As I have told you, you have not told me whether you use lead or whether you use——

Q. I am getting at what you used in making the estimate.

A. I should use the union couplings, union joints you know.

Q. What do you have to furnish them?

A. You carry your service around and carry it up along the side of the shelf on each side so it is about ready for your meter, you have your meter cock there and stick that in. That is about it. That generally comes in on the service, come around and have another man set the meter.

Q. You put it on service?

A. Usually let it go on service.

Q. Did you let it go with the service?

A. I did let it go with the service in this case, yes.

Q. How many men do you send out to set a meter, one or two?

A. It is a horse and wagon and a boy and a man and a bunch of tools.

Q. You have allowed us for this material and labor 50 cents?

A. I didn't say anything about the labor.

Q. Well isn't that in the setting?

A. No, that is in the 12½ per cent. 50 cents is getting it

2750 out there

Q. Then this 12½ per cent is not overhead charges?

A. I told you I didn't know; maybe I had used an incorrect phrase. It includes none of the president's salary or anything of that sort.

Q. Have you figured your overhead on this same basis on the other items that is have it include part of the actual cost of doing the work?

A. What do you mean by other items?

Q. The other items in the inventory where you use 12½ per cent overhead.

A. No, done it the other way, you have an overhead very carefully gotten out.

Q. Now after you have gotten this meter in you depreciated it 33⅓ per cent, in parenthesis here two to three years' use?

A. Yes, sir.

Q. That cuts it down to what?

A. That cuts off about one third of it, and cuts it down a total of $141,713?

Q. What is the average life of the meter?

A. A meter that is not looked after carefully——

Q. No, a meter that is looked after carefully?

A. Well that depends, the more carefully you look after a meter the longer you can keep it in good working order.

Q. Did you assume this well managed company did not look after the meters?

A. I don't know. I have no knowledge of the details of their mete- department, I merely glanced through it.

Q. I didn't ask you, your knowledge, I asked you whether for the purpose of giving the depreciation without knowledge you simply took it for granted that they did not look after their meters?

2751 A. No, I thought the- looked after the- pretty well.

Q. One of the items which you referred to yesterday where you said they spent too much money and then afterwards concluded they did not was the meter repairs wasn't it, and you said that was one item where the expenses had been going up?

A. I think I excepted meter repairs as not unduly abnormal while all of the other repairs for 1910 were strikingly abnormal.

Q. You were disposed to condemn them without first inquiring. I will pass that though. Assuming that these meters are kept in good repair what would be their average life?

A. I would have to find out first about how often they take them out and look them over and replace them, dip them if you please to put it that way.

Q. What average life did you take in getting at your depreciation here?

A. Why about seven years without paying much attention to repairs merely putting it in that line.

Q. In other words you assumed that the meters were just simply put in place and not kept up in order to get your life of the meters for the purpose of your depreciation here?

A. No, a little hard to put my impression in regard to that matter in words. I assumed that the meters were very well taken care of from the looks of things and I assumed too that notwithstanding that fact that a meter was something which had continued movement in it which had diaphragms in it which would stiffen and harden and it had moving valves and parts on the top which would probably wear a certain amount, no matter how good your repairs were or how careful you were of them and by the time a meter was about seven years old it was ready for what they call a thorough

overhauling in which the records were quite costly. Now on
2752 the other hand, if that was not the case and everything was taken care of and watched closely fixed promptly then the probabilities are that the li- of the meters was so considerably more than seven years and that consequently the age of the meters would go up as well. I did this and left it as it was without revision after having had an opportunity to carefully read Exhibit 8 which is the basis of all the work presented by the engineers here furnished by som- person who knows the figures.

Q. It is customary for gas companies to take meters in and adjust the- periodically isn't it and make any repairs that is necessary?

A. It certainly ought to be done.

Q. That is customary isn't it?

A. No, I would not s-y that but among all good companies and I shoul- fancy here it was done.

Q. It is something that is done in all companies that are properly managed isn't it so far as wou- knowledge goes?

A. Yes, so far as I know.

Q. Now this company here takes its meters at least once in three years and tests them and overhauls them and if the- need any repairs makes then. Would that change your inference as to the probable age of the meters or as to whether they had depreciated 33⅓ per cent in from two to three years.

A. I- should certainly increase the life of them.

Q. I said age, I meant life?

A. Unfortunately their Exhibit 8 as to age is I think somewhere about eight years so any opinion I might give you now would not be unbiased and I understand that you claim in No. 8 that the life of a meter is about 25 years.

2753 Q. I don't remember.

A. That is what Exhibit 8 and also all reports of engineers, and this Exhibit 8 came from Philadelphia or some unknown person. I should not think that the ratio of depreciation or percentage of depreciation would be much affected, you get a greater life and you get a greater age out of your mete-s as you get a greater life.

Q. You then would not change your depreciation whether the life was seven years or twenty.

A. I tried above all things to assure you it was a matter of judgment and opinion and I don't think there is any necessity now of changing it, but I might under different circumstances make a widely different depreciation.

Q. Now then let's get back to this service and find out where you put in that dollar for the meter cock. That is section 77, you have given your cost of your services detailed there, now where is it?

A. 80 feet multiplied by four cents gives $3.20 it is somewhere in there.

Q. Price per foot you have given as wrought iron, it is not in there?

A. No.

—. Then comes carting, fittings and miscellaneous, is it in that?

A. Yes, it is in that $3.20.

Q. I didn't ask you about the $3.20, is it in the carting, fittings and miscellaneous?

A. Yes, sir.

Q. Is it in that item?

A. In that item.

Q. That you have at four cents a foot?

2754 A. Yes, sir.

Q. And there are 80 feet, that gives you $3.20?

A. Yes, sir.

Q. Now $1.00 of that is for the meter cock?

A. Something about that price, a meter cock is not necessarily just $1.00.

Q. It may be more I suppose.

A. May be more, may be less I don't know the recent prices.

Q. What does miscellaneous cover?

A. Just what I said there.

Q. That must cover the pipe laying must it not?

A. Ditching at ten cents, if a man picks up the pipe like that and throw it in and couple it, might throw it into the ditch.

Q. Your ditching is exactly what you use the same amount for ditching without any pipe laying.

A. I hardly know, the difference in mains is so great, some men ditch and screw the pipe in and get away with the thing before another man would get the ditch finished. It is always a rough average.

Q. How closely then ought honest competent engineers, how close to each other ought honest competent, experienced engineers get in their estimate upon the value of such a plan as this suppose they are independent estimates?

Objected to as incompetent, the form in which the question is asked.

COURT: I don't think that is a proper question.

Mr. GUERNSEY: I think it is proper but I can get at it in another way.

Q. You say here in your report y-at where you have the details from which to make an estimate given fully it is unneces-

2755 *neces*sary to include any item for omissions or contingencies, things of that kind or any considerable item. Now will competent and experience- and honest engineers making an estimate such as this come within say ten per cent of each other?

Objected to as incompetent, not proper cross examination.

A. I can't answer you.

Q. Then unless competent, experienced and honest engineers would reach substantially the same result, would it not be necessary to include something to cover this matter of conti*b*gencies and omissions and differences of opinion, things of that kind?

Same objections.

A. In the matter of a preliminary estimate where the question of a man's foresight or man's memory, of a man's experience which

might be said ought to be more or less independent of his honesty, it is quite possible that just in proportion to lack of experience and lack of thoroughness and lack of memory or of foresight the percentage for the probable omissions should be increased that should be necessary and every man usually marks—if my experience of 40 years is worth anything—the amount of his lack of confidence in his own argument. The more inexperienced an engineer feels himself to be the higher he runs up all these everhead charges.

Q. It is something l-ke a dwelling house where you have everything covered by your plans and specifications it is necessary to add a percentage to cover contingencies.

A. In preliminary estimates.

Q. In any estimate either made by the bidder or made by the architect or made by the engineer if you please to cover probably cost of building.

Q. Do you refer to an estimate of a building built and in
2756 position and open to examination at every point?

Q. I refer to an estimate of the cost of building a building.

A. Ahead of its being built.

Q. I don't care whether before or after it is done?

A. Before a building is built and while simply a matter in the mind of the architect or engineer or contractor it is necessary and proper that a considerable allowance, we will say of 15 or more per cent should be made, I am giving merely my opinion, for overhead charges and contingencies and omissions and all of the various points even in the best of work by the most experienced men. I will say just such men as William Farmer of whom I have spoken as highly as I know how. After the work is done——

COURT: You have explained that to us.

Q. Then on your theory your estimate of that i*w* would cost to reproduce this plant would be less than what -ou would estimate of the cost of building it if it had not been built by the difference in this item.

Mr. BRENNAN: It seems to us he has explained his theory very fully it is a mere repetition.

(Question withdrawn.)

Q. If I understand you the result of what you say is that if we had the plans and specifications of this plant and you were estimating what it would cost us to build it this amount would be greater by what you would add on account of these contingencies than the amount which you would estimate now is necessary to reproduce it?

Same objection.

A. It would not be—probably would be less because it would be impossible for any living engineer to anticipate the enormous detail of your inventory of November 1, 1910.

2757 Q. Well could you build any of these houses without having—could you l-t the contract for any building without having as much detail as we have here?

A. Of course I had no opportunities to see your contracts, but I should consider it very extraordinary if the specifications and drawings approach even in a remote degree the exhaustive list and work which has been done on your inventory list.

Q. You would expect drawings that showed accurately the dimensions wouldn't you if you were going to let a contract for a building, you would expect that?

A. Yes, theoretically.

Q. You would expect these drawings to show the openings, windows and doors of various styles in the building wouldn't you?

A. Yes, sir.

Q. You would expect the drawings and specifications to show the materials used wouldn't you?

A. Yes, sir.

Q. And you would expect the specifications to go further and specify the kind of brick, kind of mortar and things like that.

A. Yes, sir.

Q. Now then do you think it would be posible for us to get bids on machinery in place without describing it with accuracy or in detail to complete such a plant as this?

A. Most of your machinery has probably been bought simply as of a given capacity without any accurate drawings or specifications being made by the engineers of this company.

Q. That is true and you do not find drawings or specifications for pumps or generators or boilers or engines in this inventory do you?

2758 A. No.

Q. Now then in what particular is the description of the machinery here more specific than it would have to be to get intelligent bids?

A. Because you have not taken into consideration the matter of human fallibility to a time certain and there would be omissions and alterations, perhaps large changes made either during the progress of the building of this estimation or within a period of a few years after its starting *it* merely as a matter of convenience.

Q. So if we were to reproduce this plant we would have to incur all these contingent expenses if we were to build a new plant here?

A. You use the phrase, reproduce this plant.

Q. Yes, by building a new plant.

A. Well do you mean having a plant being equal in capacity or simply it should be a matter of brick and mortar and iron photograph of what you have down there.

Q. I mean the latter.

A. Well in that case I presume you could come very close indeed to it without any particular allowance, I should say ten or 12½ per cent for overhead charges.

Q. You would allow us for building new works ten or fifteen per cent for contingencies and for reproducing this allow us about 20 I understand?

A. No, I said about ten to 12½ per cent.

Q. Don't that cover interest and taxes and a lot of other things?

A. No, for reproducing it you would have interest and taxes just as much.

Q. I wanted you to give me what the actual contingencies were, what you allow us for contingencies?

A. I will look it up.

2759 Q. Don't allow us anything do you in your 12½ per cent, see the top of page 10?

A. Yes, I make you quite an allowance for contingencies there in general management.

Q. You state with reference to general management in the preceding page that it covers these organization expenses don't you?

A. In order to be liberal I allow cost of board of directors, legal advice at its actual cost, drawing and supervisions of four per cent.

Q. That don't say contingencies does it?

A. It involves very much of contingencies for management.

Q. Then you didn't mea- what you said when you said four per cent on account of these general expenses and organization expenses?

A. Well I may have been polite about it.

Q. That is also inaccurate. You say here on page 9 it does not appear to be the custom in any community to tax unfinished buildings or unfinished machinery. Do you know as a matter of fact the assessor goes around in Des Moines and does collect even unfinished small residences and check them?

Objected to as immaterial and irrelevant because it does not apply to a concern of this kind what the assessor may do with regard to residences or dwellings?

A. I am not posted.

Q. So as to getting your taxes down as low as you put them you had to assume that the property would not in fact be taxed?

A. The books are the best evidence always, if they are taxed they could be shown, but I don't know. I did the best I could.

Q. You assumed that the property would not be taxed?

A. I understood that the land would be taxed.

2760 Q. That is all the taxes you charge in there?

A. I allowed a margin to pay some taxes on finished buildings, if I had not I would not have put 2 per cent on. In other words I put two cent, it was very close to 2¼ on to take care of any buildings which might be taxed during the last year of the year and a half.

Q. Now you put drawings and supervision at 2 per cent.

A. Yes, sir.

Q. The minimum engineering fee that is charged under like circumstances is five isn't it?

A. It is not.

Q. Give us an instance of any engineer within the last five years charging for preparing designs and for supervising the erection of a gas plant less than five per cent.

A. The St. Louis——

Q. No, I ask for the last five years?

A. This happened within the last year. The St. Louis engineering club, if I remember rightly in the engineering news met together and passed a set of rules with regard to prices for their work, and if I remember rightly they mentioned five per cent as the top price and then scaled down in proportion to the size of the work for instance, where an enginer probably would have to handle to the amount of about a million dollars in the work here, something of that sort perhaps 750,000 if he was designing it, give him one per cent for the drawing, $7,500——

Mr. GUERNSEY: I move to strike out the answer as not responsive.

Q. (Question read.)

A. I can't name specific instances.

Q. Do you know anything about what engineers charge for work of this —.

A. I do.

2761 Q. Tell us a specific instance within the last five years that you know about?

Mr. BYERS: I submit that has been answered, it is not important anyway, the question is ,what it is worth.

A. I know they are very glad to do work less than five per cent.

Mr. GUERNSEY: I move to strike the answer as not responsive and ask to have the question read to the witness.

(Question read.)

A. Have to give me a little time to look up memoranda on the matter and in the meantime I will tell you I can't recall any.

Q. Now you put your interest down to 4½ per cent if I understand you correctly on the theory that payments will be deferred?

A. I did.

Q. Did you suppose that the manufacturer, or contractor is going to carry the company without charging for it?

A. He gets his money in the contract price.

Q. But do you think that if you defer the payments that the interest won't be in there?

A. Very probably not.

Q. Probably not.

A. Yes, sir.

Q. You figure that the manufacturer and contractor don't know enough to know that somebody is paying that interest and don't know enough to take it into account in making his price.

Mr. BYERS: That is simply argumentative.

A. I gave you prices which the manufacturer would be very glad to get at the time when the contract is finished and therefore the company would hardly pay interest on it unless they borrowed the money.

Q. Now where do you cover here in your contingencies
2762 things like insurance and personal injury and things of that kind?

A. Again I shall have to refer you to general management.

Q. Can you give us the total amount that you have allowed on account of overhead charges?

A. No, I didn't pick it out.

Q. Taking your revision of your statement as to meters, it runs less than $51,000 on the total job don't it?

A. I just told you I didn't pick it out.

Q. Who gave you your figures on the cost of pipe laying in the yard?

A. Result of my own computations.

Q. Turn to page 80 for a moment. Have you in ascertaining your annual depreciation, have you figured meters at the rate of 15 per cent on the structural cost per annum?

A. Yes, sir; shown here seven years.

Q. And while you were taking your residual depreciation of six cents, when you were getting it here to get your computation on this page, it shows a residual depreciation of 8.17 don't it per thousand?

A. Yes, sir.

Q. Now just for fun I would like to get from this page your total depreciation that you charge for a year including both kinds?

A. That is only a rough check.

Q. The page is headed residual depreciation for one year?

A. Yes, sir.

Q. Computed for one year.

A. Yes, sir; and the bottom of that the following 6 per cent depreciation derivee from larger quantities and longer period is a more correct approximation.

Q. You have as depreciation $12,445.77, that is without figuring your repairs off?

2763 A. Yes, sir.

Q. Then your depreciation on house services and lamp post services of $20,536.18?

A. Yes, sir.

Q. And then depreciation on meters of $31,885.50?

A. Yes, sir.

Q. So to get the total depreciation which you figure we should have to add these together shouldn't we?

A. Yes, and then subtract the appreciation.

Q. The appreciation you deduct, but it does not affect the depreciation that actually takes place, simply affects your balance don't it?

A. It affects the amount of total depreciation, residual depreciation purely a commercial matter.

Q. So you get a total of $65,000 you figure the plant will depreciate per annum. Then cutting out part of that for repairs you have for residual depreciation, you leave 2 cents and a fraction per thousand without taking the correction?

A. 63,000 less 7, 57,000 less the repairs.

Q. No, your total depreciation you figure here is just under $65,000 isn't it, $64,867.45, about 65,000 on three matters, house services and the yard structures and buildings and meters, if you take off repairs you get residual depreciation?

A. And if you take off the appreciation of the land you get what might be called the residual commercial result which is about $43,162.

Q. And getting back to your total you figure a total depreciation there of about 5 per cent on your present value of the plant don't you, 5 per cent on your $1,400,000 would be $70,000 wouldn't it?

A. Well you might average it so in that way.

Q. Well that is a fact isn't it?

2764 A. It is a little less than five per cent but that is depreciation without repairs you understand.

Q. I understand. We charge part of that away to repairs and part of it not. Now in your earnings that you gave us, charged us with you included our earnings from Valley Junction didn't you?

A. What page if you please?

Q. Well in making your figures here what our earnings were and what the net return would be.

A. On what page if you please.

Q. Wherever you did that in your report?

A. As far as I could I used 528 million instead of 531 million in 1910.

Q. Well take your page 85 where you estimate the receipts for five years there?

A. The accountants advised me the gas that is sold at Valley Junction and to the city of Des Moines.

Q. You didn't take into account the investment outside of the city limites did you?

A. I did not. And it made no difference whether I did or not.

Q. What do you mean by that?

A. It is a question of operating cash cost for gas.

Q. But you also get a question of return back here, don't you?

A. Yes, but that is return for Des Moines by special request of the company.

Q. It excludes the Valley Junction earnings does it?

A. The Valley Junction outfit or inventory I find a statement in which you have cut it out altogether from your inventory. It was excluded by the company and so of course I let it go. Now when you come to the question of putting in coal and oil to make gas and averaging up a price as the result of that it would be rather

2765 unfair to leave out Valley Junction because you could not separate the coal or coke or oil that makes the gas for Valley Junction from the coal or coke or oil that makes the gas for Des Moines, so it is better to charge the sum total to the gas sales for the two places and divide it into calculations for the two places and also into operating expenses of the two places.

Q. Also figure it as return on the investment in Des Moines alone?

A. No, the operating cost is based on the cash that goes out and on the depreciation that occurs per thousand cubic feet of sales.

Q. The Valley Junction gas is sold at $1.50 isn't it?

A. I don't know about that.

Q. Why didn't you just figure the expense of the additional gas that goes to Valley Junction at the expense of the oil and fuel the way you figure up the additional expense of this new 60,000,000 we are going to sell?

A. Because that was not what might be called——

Q. It was not the right way to figure it was it?

A. I don't know how to phrase it but it was not a thing that was temporary and impending, of course this 60 million you speak of will soon be reached, you will have more apparatus then, you will have to add on to the old plant again.

Q. Now then on page 89 here in giving the per capita sales, you include Valley Junction as well as Des Moines don't you?

A. I have no means of separating the gas sold to Des Moines.

Q. And these gentlemen you remember, exhibited a sheet of sales in Des Moines and sales in Valley Junction?

A. I was not in the court room, away every day and hard at work on what I had to do myself.

Q. You didn't ask the city's accountants to give you that
2766 information?

A. I don't recall that I did. It was not a matter—please recollect one thing when we get per capita sales it is nothing more nor less than rough irregular quantities, it shows a tendency of growth if you choose to call it so but it is hard to measure and certainly I don't claim to measure it regularly at all only as a tendency of growth.

Q. I have here Professor, a table that has been made up showing Lawrence, Cambridge, Lowell, New Bedford and Springfield from the Massachusetts reports showing as to each of the years 1901 to 1910 inclusive as to each town, the average rate per thousand of population as given in these reports which you will observe runs uniformly at five year periods, the total sales of gas, the sales per capita the total meters, the sales per meter, the population per meter, the total miles of main and the works' daily capacity together with the per cent of increase in some of these amounts as we go along. Now I don't want to take the time to ask you to make these computations here, but will you verify these tables for us so there may be no question about their correctness as showing the actual facts as to the sales of gas in the particular cities in Massachusetts in connection with the change in the prices?

A. 1901 to 1910, I have but a few copies I might go back a year or two and be glad to do it because I always welcome any additional information on the subject.

Q. We will furnish you the copies of the reports that you have not of the Massachusetts commission if you need them.

A. It would occupy quite a considerable length of time to carefully verify this.

Mr. GUERNSEY: It seem*ed* to us i*n* we are to get any intelligent

results from Massachusetts as to whether a decrease in price meant
an increase in sales without an increase in plant it would be
2767 necessary to run through the history of a single city and we
took four or five cities nearest to Des Moines in size and
having about the same price and we would like to have the witness verify this so there may be no dispute about its accuracy.

Mr. BRENNAN: If they have an exhibit that they want to offer in evidence of course it seems to us it would be time enough when it is offered.

COURT: If the witness is willing to do it I have no objection.

Mr. GUERNSEY: I would like to have the witness do it so we will have no dispute about its correctness, that is the only object we have in having it checked. Are you willing to do it?

A. So far as I have time I would be glad to.

(Table marked Exhibit 44 and 44-A.)

Mr. GUERNSEY: I think your honor that is all with this witness except when we get this letter of February we would like to ask some questions about that. We may have inadvertantly overlooked something.

Mr. GUERNSEY: We move to strike out Exhibit 23 and make the same motion as to each paragraph of it because it appears first that it is not based upon the experience or knowledge or information of the witness. Second, it appears that it is hearsay. Third, that it appears that the prices are not prices which the witness from his experience and knowledge knows are current prices in the city of Des Moines and finally because it does not purport to be an estimate of the value of the property in controversy.

Redirect examination by R. O. BRENNAN, Esq.:

Q. Now Professor Marks, you were asked by counsel with regard to
these omissions. I will ask you if you were going to buy a
2768 stock of goods and the merchant or owner from whom you
were purchasing there goods had a complete and detailed inventory of the stock which you were about to purchase if you would expect to have him add to that inventory 8 per cent to cover omissions?

Objected to as irrelevant, immaterial because not predicated at all on similar facts and also as argumentative.

A. I should not.

Q. Where you have as you have in this case a complete detailed itemized inventory of the property which you were called upon to appraise or value you do not feel it necessary to add anything for omissions?

A. I have not in this case.

Q. And the reason you have not done so is because you have assumed that all of the property is contained in the inventory Exhibit 15?

A. Because so far as I have gone into this matter I have not been able to find any omissions.

Q. Now there is another matter to which I want to call your attention at the bottom of page 87 of your report Exhibit 23, you

suggest a sliding scale as the fairest method as between the purchaser and consumer in regulating prices of gas and I note that you use this language but no suggestion of a sliding sale has been made in the ordinance the Des Moines City Council passed December 27, 1910. Referring to the above what qualification do you make as to the statement regarding the sliding scale?

A. I should have made the qualification that it would be impossible for the city council of Des Moines or any other city council to pass a proper sliding scale ordinance without having a complete present valuation of the company's works and a complete investigation and determination of the cost of supplying gas at the
2769 consumer's meter and further fixing upon some rate of profit or of dividends whatever you choose to call it as being fair and reasonable and from the cost of gas and the profit fixing a standard price for gas.

COURT: Can there be a sliding scale under our statute?

Mr. BRENNAN: He has referred to it in his report and I imagine he had the Massachusetts method in mind when he introduced it in the report and I simply wanted to have him explain upon what theory a sliding scale might be introduced, what was essential.

Q. So if I understand you rightly even a sliding scale could not be safely introduced in an ordinance prescribing rates with any fairness to the consumer as well as the producer without an appraisal and valuation of the plant should be made in advance of the passing of the ordinance.

A. That is correct, it should be so.

Q. Now did the prices secured by Mr. Dobson and Mr. Hasek commend themselves to you as to being reasonable prices and charges for materials to be used in your report Exhibit 23?

A. Wherever the prices secured by my assistants were brought in I gave them careful consideration and used them when I found them to be reasonable. I had occasion to compare these very carefully with them and with others, of course I used no figures that did not commend themselves to me personally as being reasonable and right.

Q. Now did you in the use of the unit prices which you have introduc- or employed in connection with your report, Exhibit 23, rely upon the judgment of either Mr. Dobson or Mr. Hasek with reference to the prices which you have used in your report or are the prices used by you in your report based upon your own independent judgment ?

2770 A. In every case upon my own independent judgment, but it is quite impossible for one man pressed for time as I was to do anything else than avail himself of assistance where he could get it and information from where he could get it in every direction.

Q. You have referred to the number of brick and have referred to this model showing the number of brick to a cubic foot. Was that suggested to you by Mr. Dobson or Mr. Hasek or anyone else?

A. It was not. It was wholly my own idea.

Q. In making your valuation of the property of the Des Moines

Gas Company as shown by your report, Exhibit 23, were you influenced or controlled in any way by anything which appears in the reports of Mr. Lea or Mr. Beahr or Mr. Hagenah, or any of the engineers who testified on behalf of the complainant in this case, or Mr. Randolph, I forgot him.

A. Of course I didn't hear all of them only portions of each one I think except the first. If by the word influenced you mean made use of any of their reports I would say most positively that I had no use for them and made no use of them.

Q. In other words, Exhibit 23 represents your independent judgment and valuation of the property of the Des Moines Gas Company?

A. It does as near as I could make up my mind.

Q. In answer to one of Mr. Guernsey's questions with regard to your experience with a low carburetted water gas system you mentioned some experience which you had in an experimental plant near the city of Philadelphia. I wish you would tell us what that experience was.

A. When Prof. Lowe had just begun his work and had gotten far enough along to make gas and put it in the holder, I was sent by the president of the Brooklyn Gas Light Co. to Manayunk, Philadelphia for the purpose of assisting Prof. Lowe and also of
2771 making a record, that is keeping a record of what he was doing and how he did it and reporting orally with memorandum to them. I was engaged for quite awhile during the operation of these little generators and of course there learned the principles of operation which Prof. Lowe was trying to carry into practical effect in a large way. Subsequently some time in the neighborhood of 1900 at Fostoria, Ohio, it was necessary for me to get this apparatus into operation on a practical scale it was either 6 or 6½ feet generators I forget which and as it is difficult in a small town to get anybody to operate—experienced in the carburetted water gas process for some days and a portion of each day I personally operated the low carburetted water gas process making the gas and getting it into the holder so that I can feel that from beginning up to date almost so far as the low carburetted water gas process is concerned I had not only a history, but a very practical apprenticeship of the business.

Q. Do you recall whether any information which you secured at that time for the persons whom you represented was acted upon by them in making investments?

Objected to as not proper redirect examination.

A. The information was reduced to the form of memoranda and subsequently used in considering purchase of gas works in which these gentlemen who were men of very large means, millionaires and multimillionaires, were interested all over the United States.

Q. Now at the risk of emphasizing Fostoria, I want to venture the question and have you tell the Master just what services you performed in and about the gas works at Fostoria?

A. Going to Fostoria, Ohio, a town of some 15 or 16,000 inhabitants, I found there a joint gas and electric light works. I have been

in electricity from its very outset working with Edison in
2772 1878 and so the rehabilitation—the works I should say were in very bad shape and in getting the rehabilitation of the street lights practically the matter was disposed of and I turned my attention to the gas works which was also in the same building. I found that the benches and retorts there were in such shape they had to be rebuilt, I refer to coal gas retorts where gas is made by the carbonization of hard coal. In order to be able to rebuild the coal gas works it was necessary to get an incomplete low carburetted water gas apparatus into practical operation. There was no one there knew how to run it and so with the aid of a man who was a common laborer and inexperienced in the matter the small low carburetted water gas business was started in and when it was running right the coal gas benches were allowed to die out and the benches were renewed I think under a contract with the Russell Bros., or Russell, St. Louis men I remember making a contract with them, I have forgotten who they were excepting there was a Russell in it. After the coal gas benches were again put in proper shape, generator benches, it is a little more economical to make coal gas because of the residuals and so the carburetted water gas plant was kept as very frequently is done, after putting it in good shape for its run, kept in good shape for the purpose of meeting any emergency that might arise in the way of extra demand for gas.

COURT: If I understood you right you did not use the crude oil there?

A. No, the difficulty of that was this, I was right there in the oil country you know and the moment a man strikes oil there, he calls on the pipe line people to run a line to him from the tank to his small oil tank to run to their big tanks and they found out without anything particular being said that if they sold crude
2773 oil to me they could not get a pipe line run in if they struck oil and we got from the Standard Oil people, the- sold us what they called gas oil which is a heavy distillate, heavier than kerosene at between 3 and 4 cents a gallon in carload lots.

Q. State in what manner they measured the gas used by the consumer?

A. Through an ordinary meter, station meter and through an ordinary dry meter.

Q. Installed at the residence or place of the consumer?

A. That they installed at the residence yes.

Q. You were actively engaged at Fostoria in superintending the works and seeing to it that the service was performed?

A. It was a small works and it was necessary that somebody should actually do the work and often with my own hands I have made gas for them, made gas with my own hands and I have run the electric machinery with my hands.

Q. I believe counsel asked you something about your inspection of the monitor supports on one of the buildings of the Des Moines Gas Company and you stated that the employés of the company refused or did not at least give you any information such as you asked. Now I wish you would tell the Master more fully just how

they did act toward you during the times you were making your investigations?

A. Whenever I have been to the works the first thing to do was to obta- a pass from the general office located on Seventh street. Having obtained the pass from the general office I generally fix the time when I would be there at the works and reaching the works I was usually met by two men whose business it was to accompany me. If I asked any question beyond merely where a thing was there was no reply, they were dumb. A good many times I found them whenever I made a note busily engaged in looking over my
2774 shoulder and reading it, in fact in one case one of their representatives having failed to read over my shoulder asked me what I had put down in my note book. That is the only time they manifested any desire or interest in the way of talking, to talk or ask questions or to answer them. There was nothing more than the mere pointing out of whatever I asked for. If I desired to have any explanation of any sort or kind, I did not get it, might as well have been a deaf and dumb asylum. However, it did not bother me very much because I have been in a great many gas works.

COURT: Find them all alike?

A. Pretty much all alike there is not very much difference in them.

Here the further hearing was adjourned until 9:30 A. M. tomorrow.

2775 Wednesday Forenoon Session.

AUGUST 23, 1911, at 9:30 a. m.

Counsel for the respective parties all present.

Testimony on part of defendants resumed as follows:

WILLIAM D. MARKS, continuing his re-direct examination, examined by R. O. Brennan, Esq., testified:

Q. Now, Professor, in answer to one of the questions propounded to you on cross-examination you started to tell of some experience which you gained in connection with some work you did for Thomas A. Edison, concrete work, I think, and you were not permitted to finish your answer. I wish you would tell the Master in a general way your experience in that connection.

A. In 1887 I was appointed through the influence of Thomas A. Edison engineer in chief for the Philadelphia Electric Light Company with instructions to build a 10,000 horse power station, the idea being at that time to build the largest station in the world for the Edison Company in Philadelphia. There were no precedents for such stations. It was necessary for me to begin at the foundation with my work and the foundation plate for the station there is something over one hundred feet high and a plate of concrete one hundred feet long, seventy feet wide and ranging from four to ten feet in thickness, according to the condition of the earth underneath the foundation. This plate of concrete at that time was considered a

very great undertaking. It was necessary for me to work out the methods of making concrete, experimental, and then to build the plate, which I did. It was also necessary for me to work out a station having some eight floors on it and carrying about four million pounds of machinery and its own weight of course,
2776 iron work to the floor for each floor. The station was built and is standing today. The important point at that time, in 1887, was that concrete was practically in a large way very little known in this country and it was considered quite an innovation—I mean on a large scale—so I think I can say that some twenty years ahead of the general use of concrete this large work had been done. The floors themselves where this heavy machinery lay were on steel beams——

The MASTER: Steel?

A. Steel beams and arch and concrete so as to give them very great weight as well as very great strength on account of the vibration received. That too was considered at that time an innovation rather a daring one. In 1889, or by 1889 I had become unofficially consulting engineer for the many stations that were in contemplation or in actual construction for the Edison system throughout the United States and in the case of the larger ones was usually requested to personally investigate the matter and did so in a number of cases, and in every case that I recall there was more or less concrete work there. I think this will straighten out for you any doubt that may have arisen in your mind as to whether or no I am practically familiar with concrete.

Q. Did that work you have described come under your personal supervision?

A. Every bit of it.

The MASTER: That is, you superintended the construction of it as well as designed it?

A. I felt so anxious about it, you may say a good portion of my time was spent right along side the reamers and gangs and nobody could get closer to the work without doing the actual work
2777 with *its* own hands.

Q. And what did you have to do with the designing of the work?

A. I designed every bit of the Philadelphia station, from the first bed of concrete through to the last connection, you might say almost.

Q. Have you in connection with your work as a consulting engineer made valuations at any time for investors in gas properties and other public utilities?

A. From 1876 to 1887, when the whole of my time was absorbed by this electrical work I have just mentioned, I was Professor in the University of Pennsylvania and practically all my leisure was absorbed, as I have stated before, by a certain syndicate of gentlemen who at that time were largely interested not only in Brooklyn and New York, but also in many cities of the United States, and it was necessary in serving their purpose that I should not only make a physical examination on the spot with particular regard to the condition of the work, but also that I should at times go very carefully

into the finances of the work, making careful computations of the profit earning capacity. These reports were very numerous, sometimes several in a year, and so far as I was concerned disappeared, being wholly for confidential purposes and furnishing data on which they acted in purchasing gas works.

Q. Now, in your report on valuation, Exhibit 23, counsel asked you if you allowed anything for clearing the site and staking out buildings. Is that item, or rather are these items included in your report, and if so, please state where?

A. The clearing of the site and staking out appears to me a very small matter and fully covered by the 12½ per cent overhead charges.

2778 Q. Now your attention has been called to the sketches referred to as Complainant's Exhibit 16, and I noticed in testifying with reference thereto you consulted a blueprint. I want to ask you if you were furnished with a copy of Complainant's Exhibit 16, or are the blue prints to which you have referred the only copies that have been furnished you?

A. The blue prints were the only thing I have been able to examine and the only thing furnished to me.

Q. Have you made an examination or a comparison between Exhibit 16 and the blue prints which you have used in your report and in giving your testimony for the purpose of ascertaining whether the blue prints are a true and correct copy of the sketches in Exhibit 16?

A. I attempted to do so but was refused an opportunity so to do by counsel for complainant.

Q. The question is whether you have?

A. I have not.

Q. Now, Professor Marks, would there be any substantial difference in the value of complainant's property on the 1st day of January 1911, as compared with November 1st, 1910, the latter date being the date used in Complainant's Exhibit 15?

A. There would not be if the same items were taken as were furnished to me in the inventory list—none that could be measured.

Q. Is your valuation of the property of the complainant at the manufacturing works, that is the buildings, machinery and holders, the cost of duplication for November 1, 1910 on the basis of the prices then prevailing?

A. It so happened that on the average the prices of duplication about the 1st of 1911 are the prices which were used for the purpose of obtaining the structural cost.

2779 Q. And what would you say as to the meters?

A. In what respect?

Q. In the same respect, whether or not your valuation which you have placed upon them would be on the basis of the prices then prevailing as of January 1, 1911 on the duplication theory?

A. So far as I have been able to learn the reduplication of the meters in position on the 1st of January, 1911, is about the same or perhaps a little less as the structural cost of the meters allowed by me on the basis of 33⅓ per cent off.

Q. Now would the structural cost of the meters as of January 1, 1911, coincide with the structural cost as of November 1, 1910?

A. Very much the same, slight variation.

Q. In the case of mains and services, and leaving out the question of paving, how does the value reached by you compare with the value you would have reached had you assumed all the mains and services had been laid say within two years following January 1, 1911?

A. If by that you mean one large undertaking or contract, continuous, occupying two summers, I would say that the mains and the services could be put in by the company for about 15 per cent less than was actually paid for interrupted work or contracted out with the fifteen per cent profit to the contractor for about what I have estimated.

Q. What would you say about the cost of mains and services, that is, the relative cost of the mains and services in the past?

A. One moment—let me clear up the last point. When I use the word 15 per cent, I refer to 15 per cent contractor's labor and on the contractor's raw material, but not 15 per cent on the cast iron pipe and not to 15 per cent in the case of services on the wrought iron pipe.

2780 Q. The last question was, keeping in mind the structural cost of mains and services in the past, what would you say now as to the relative cost thereof?

A. As near as one can do, when one is making an appraisement, they are identical.

Q. And would this 15 per cent which you say would be added if it were a small job, would that obtain in the case of meters and services laid in the past, where it might have been in large quantities or large jobs?

A. Wherever you can organize work—I think everybody agrees with me—that continuous work is very much reduced in cost, for many reasons. Perhaps I had better not try to go into detail. To take up the putting in of meters and services, I referred to, labor now would undoubtedly produce a very large saving. 15 per cent in the least, and in proportion to the organization a larger per cent would be quite probable.

The MASTER: But meters and services have to be put in at the time they are called for?

A. Yes.

The MASTER: The- couldn't be put in under large contracts?

A. We apparently are drifting away to the hypothetical idea of the company, for a reduplication.

Mr. BRENNAN: I was simply making that inquiry for the purpose of comparison.

Q. How much value do you give or did you give to the mains and services new by the method which you actually followed in your report Exhibit 23?

A. You mean the total cost of mains?

Q. Yes, and services.

A. The total cost of mains is about $652,000 on which
2781 there was no depreciation allowed or taken. The total cost——

The MASTER: That figuring as I understand it here, is where they are laid entirely before the pavement was put down?

A. Entirely before the pavement is put down, but allowing for the ordinary difficulties in street works, such as moving a sewer, inlets, running under crossings, possibly running into small amounts of macadam paving, and coming under such steam and electric railways as would occur in a city like Cleveland or Buffalo.

Q. Do you remember the amount which you allowed for the services house services without depreciation?

A. I don't recall the exact figure.

Q. On page 58 of the copy of your report it refers to the house services?

A. The present value of the services is appraised by me as $137,-360.

Q. But I am getting at the structural cost of the services, which would be in round numbers $275,000, as shown by your report?

A. Yes.

Q. So that if we add that to the $652,000 representing the structural cost of the mains, we have in round numbers $927,000.

A. $927,000, adding the structural cost of the mains to the structural cost of the services.

Q. If you followed the duplication theory with reference to mains, and house services and deduct the 15 per cent off the $927,000, you have in round numbers about $135,000.

A. I have not made myself clear in that matter apparently to anybody. It would not be 15 per cent off of the cost of the cast iron mains, and it would not be 15 per cent off of the cost of wrought iron services, but it would be 15 per cent off of all the other cost that occurred in laying the mains and in laying the services.
2782 I have not figured that exactly; I could figure it for you.

Q. The 15 per cent representing the figures to which I called your attention includes of course the 15 per cent deducted from the cost of the mains and services.

A. Yes.

Q. Now, I propounded the question so as to give you an opportunity to clear up the situation with reference to that 15 per cent, so that there would be no misunderstanding in regard to it.

A. I seem to be very unfortunate. I'll get right at it, if you will permit me. (Witness computes.)

Q. Perhaps I can save you some of this computation—what I was getting at is this: If we take the amount of labor involved in the mains and services and deduct 15 per cent, as comparing it with the duplication theory, we would find the comparison in that way?

A. Yes. I could work it out in that way. I could give you a few examples if you desire, to save the time of the court. For instance, the four inch pipe is rated as costing 49 cents per foot, laid

down complete, without paving. In this 49 cents there is 27½ cents paid by the gas company for the cast iron mains furnished, and 2½ cents paid for the special castings, making about 30 cents paid for the cast iron mains and cast iron specials delivered by the company, leaving, 30 from 49, or 19 cents paid the contractor per foot for what he does in digging for his cast iron mains, digging the ditch and furnishing all the necessary lead, cement, oakum, labor, carting and everything of that sort and getting the pipe under ground and ready to pass gas. The 4 inch main in this case appears to be in this city of Des Moines about 573,724 feet, or some-
2783 thing over one half of the total length of mains—970,923 feet. And I could go on in the same way with as many as you desire.

Q. No, that illustrates it, I think, very fully. You were asked about your New York appraisal. I wish you would tell the Master just about how much time you devoted to the making of that appraisal?

A. The New York appraisal included six active generating works. About four-fifth- of all the gas in 1905 used in the city of New York was carburetted water gas. The remaining one-fifth was ordinary coal gas. Besides these generating stations there are also four distributing stations. The making of this inventory was delayed by the opposition of the Consolidated Gas Company—I might perhaps more correctly say, the apparent neglect of the company than the opposition—the results were the same for a considerable length of time, and then required the utmost industry on my part to even inspect the works. The inspection of the works item by item as near as I recall, and I only recall from memory, after a number of years, occupied about six weeks. While this inspection was going on with my assistants, the classification under the head of works was daily being taken up. In reference to the identification of the various items, it was made by me personally and no one else and was very complete. It was then necessary to make the computations and comparisons, that occupied day and night work on the part of myself and on the part of a number of assistants, as near as I can recall now, seven or eight of them, and they were occupied for many months. I do not recall how many. I was fortunate in being able to obtain, not regularly, but incidentally, the appraisals
2784 of the chief engineer of New York City in gas and electricity, Charles F. Lacomb, who kindly went out independently, and occasionally with me, and examined and valued certain buildings and certain apparatus. I was also fortunate in obtaining the inventory appraisal of Mr. Thomas Rowland, a contractor of Green Point, Long Island, opposite New York, who for many years furnished the great bulk of the machinery and buildings of the various gas companies of Manhattan and New York, and from his own records was able to give the actual cost of these buildings, as you will see from my tabulations submitted here. These were all carefully put together and compared with the testimony of a Mr. Meyer of Baltimore, who was at that time the engineer, and I think also

the selling agent of a big Baltimore gas works manufacturing concern. The inventory of Mr. Meyer was not turned in in tabulated form, or I might say in a collective form, but was given through testimony item by item, so far as he went in the various items, and in the majority of cases no explanation given as to how the work was done, but merely the bald statement as being his opinion of the worth. Putting these together and comparing them was an enormous labor, but resulted in a very thorough understanding of all the reasons and facts in the valuation of these ten gas stations on the Island of Manhattan.

Q. About how much time was required by you in doing that work?

A. As I have stated, I was about six weeks in tramping through the works and seeing those things and making notes of them; I could not say it was continuous, because I had much to do and many things to think of, but it was pretty nearly, if not every day, and just in many cases all day, and just as much of every day as I could possibly get in for six weeks and that work was followed by myself and seven or eight assistants covering many months.

2785 Q. For what length of time did your services cover in the city of New York?

A. The actual services in the city of New York began on or about January 1, 1906; I was engaged in 1905, and it was officially terminated by the decision of the Supreme Court of the United States in January 1909. I do not recall the date when the decision came down, but it was in January 1909, covering a period of almost exactly three years. By the way, I should say that in addition to that my services were used in a number of adjustment- or computations in a large amount of rebates by corporation counsel. Of course I did not appear, he merely used that material. I was afterwards requested to appraise the Bronx Gas & Electric Light Company, which I think I forgot to mention.

Q. How long were you engaged in Cleveland making your investigations and appraisals of the Cleveland Gas Works?

A. I know that it practically took up nearly all the summer and part of the autumn of the year 1910.

Q. Did your work in making that appraisal require you to make a personal inspection of the works of the company?

A. In the case of Cleveland, for the three works, there was nothing whatever furnished except permission to go on the ground, and under those conditions it was necessary for me, not only to go over the works item by item, but also to supervise and complete a set of drawings of each of the works, giving all the detailed plans of the whole three works, and in addition to that a small number of sections, such as are required for estimating purposes to make this list, and then to place the valuations, doing very nearly, but not quite so literally, the same thing as I have done here.

Q. Now, Professor Marks, I want to ask you, if the esti-
2786 mate of depreciation used by you in your report and valuation in Exhibit 23, is reasonable and in an amount which appeals to you as a consulting engineer as being fair and just?

A. On looking back over it, I can only say it was the most honest and best thing I could do in the way of engineering and making a fair and reasonable depreciation. I took for instance such buildings as are along the northern edge of the property close to the railroad, those old buildings built in 1876—a good many people would claim that they were practically at the end of their life, but because they were used, I depreciated them as nearly and as fairly as I could, for the reason of their use; in other words, if they were not in that use, I would call them worthless; that is equally true of all other parts of the older apparatus.

Q. So that upon the whole inquiry then, you would say it was fair and just?

A. Just as fair and reasonable as anybody could make it, to do the best he could.

Q. Now, counsel called your attention to some errors in your figures indicating the population in certain cities and towns in Massachusetts, and also to the fact that some outlying districts were apparently omitted from your tables. I wish you would tell the Master whether or not such omissions would affect the results which you desired to obtain from such tables, and if they did not affect them tell the Master why?

A. The overlooking of some of the outlying suburbs, and I think one mistake in the amount of gas sold, would have no effect whatever on what was being proved by that collection of figures, for this reason, the only object of that collection of figures was to
2787 show in a general way, and not in a quantitative way that as the price of gas goes down the sales go up, after the manner of a teeter, I used the sales per capita, meaning the sales per head, simply because each and every one of these cities has a different population over the rest, and the only unit I could find that would enable a fair comparison would be the sales per capita or the sales per head of population.

Q. In that connection you used the term per capita sales instead of total sales; why do you make that distinction?

A. Going more into detail in that matter, I would say of course you know the cities have not the same population, and that the only way of comparing cities of different population is by getting the sales per unit of inhabitants. I think I should add that those sales per capita, which was a matter taken up in a paper by me, in the Progressive Age, received very careful consideration in the New England Gas Engineers' Association and resulted in a committee being appointed and that committee reported the sales per capita as being a proper basis for comparison of the various cities.

Complainant moves to strike what the committee reported as being secondary, hearsay and not competent.

Q. Now I notice also that you were careful to distinguish between meter sales and per capita sales, or total sales; what purpose did you have in distinguishing between meter sales in answering questions?

A. The question of meter sales and sales per thousand feet or per mile of main are technical questions of great importance and

necessary to the managers of the companies to know what their apparatus is costing them and how effectively it is acting
2788 and it is not an important matter to the public in general nor is it relatively near as important a matter as the revenue per capita obtained. When I say that, I wish to call your attention to the fact that the revenue per capita in the city of Des Moines in 1895 was reported by the company as being in the neighborhood of $1.50. I looked up the exact figures yesterday but I do not recall them now; and in 1910, it was something over $6. per capita, the revenue per capita was; so that if you take the population in 1895 and multiply it by $1.50 you get the gross revenue of the company in 1895 per year; and if you take the population for 1910, and multiply it by $6. or thereabouts, you would get the gross revenue of the company for the year 1910, which shows as a result of lower prices which have gone on ever since then, from my point of view and of the good service which the company is rendering, an enormous increase in the sales of this company between 1895 and 1910, a period of about 15 years.

Q. Now, I think you were asked by counsel in your cross examination if your employments have been confined to muincipalities in all cases. I want to ask you if you have been consulted by others besides municipalities, for the purpose of making valuations or appraisals of gas properties or other public utilities?

A. I will answer your question without mentioning any names. You will understand that it is not fair to go into details.

Q. I don't care for the names; I want to know what the fact is as to whether you have been employed by the owners of public utilities?

A. I have been approached by the managers of the largest gas works in the United States, and I have been offered very large retainers, very large retainers, but as the condition of my work
2789 is that my reports shall always be entirely public, no reservation, of course I could not meet the conditions which would have been imposed.

Recross-examination by Mr. GUERNSEY:

Q. Referring to this last statement of yours, you do not mean the U. G. I. Company, do you?

A. I do not know. I never know where the U. G. I. is under the surface.

Q. You are not familiar with the lists of plants in which the U. G. I. Company is interested?

A. I have occasionally read over the list.

Q. How recently was it you were approached by these people.

A. If I should answer enough questions, I presume it is quite possible to locate them; so I will only say to you in one instance it was very recently; in others it was during the last few years.

Q. You are unwilling for us to know from whom you refused to accept retainers?

A. Of course, you understand perfectly well as a man of business, when one comes to you in that way, although you may not be pledged, you had better not do any talking, if you are square.

Q. So that you prefer to leave this in such a way that it is impossible to verify your statement?

A. I should insist upon so leaving it.

Q. And you are not able to say this offer of employment came from the U. G. I. Company directly or indirectly?

A. I cannot, or anybody else. I decline to deny or affirm any.

Q. What I was getting at whether you were able to tell
2790 us whether these offers of employment came from the U. G. I. Company or not?

A. My reply to that is again, as I never know where the U. G. I. is, I could not possibly say.

Q. That would mean of course that you have no affirmative evidence that it was interested?

A. I don't know where it was; that is the only way I should care to put it.

Mr. GUERNSEY: Before I forget it, I want to have this exhibit 43 marked by the reporter as Complainant's Exhibit 43.

(It is so marked)

Mr. BYERS: We do not know whether it is correct or not.

Mr. GUERNSEY: Do you want to verify it?

Mr. BYERS: Not now.

Q. Now, Professor, you said that you attempted to compare the blue prints which you had of these buildings with a copy of Exhibit 16 and were refused opportunity to do so by complainant's counsel. What you were doing as a matter of fact, was walking off with the original of that Exhibit without saying anything?

A. I asked my counsel, Mr. Brennan, whether it would be proper for me to take that exhibit for the purpose of comparing what I had, and I was told it was so proper, and I picked it up very innocently, when one of the gentlemen retained by the company seized the book and insisted I could not take it and walked off with it.

Q. You did not tell him about your conversation with Mr. Brennan?

A. Well, when one commits assault and battery——

Q. You did not tell him about your conversation with Mr. Brennan did you?

A. At that time——

Q. Yes.

2791 A. Certainly not.

Q. Counsel for the City thereupon requested this same gentleman who was one of the counsel for the complainant, to furnish the city his copy of Exhibit 16 for the uses of the city, and that was done within 24 hours from that time, and at least six weeks ago?

A. That copy never passed into my hands.

Q. I did not ask you that. It was turned over to the city for the city's use?

A. That I know nothing about.

Q. You will not say then that as a matter of fact a copy of this Exhibit 16 was not turned over to the city for the city's use within 24 hours from the incident you referred to?

A. I speak only for myself. I know nothing more than what happened then. Since then I have not had possession of that Exhibit 16.

Q. You know, don't you, as a matter of fact, that the difference between Exhibit 16 and your copy of it, so far as these plans are concerned, in your copy they are blue prints and in Exhibit 16 they are paper prints, but taken from the same drawings?

A. I do not know that.

Q. Will you say that is not true?

A. I don't know.

Q. So that you do not mean to say then that the blue prints which you have are not exact copies of what is referred to in Exhibit 16, what is contained in Exhibit 16?

A. On that point I said to you I don't know.

Q. You testified yesterday on your re-direct examination that an examination of the inventory, an investigation of the costs fixing the dividend rate and fixing the standard rate were necessary to
2792 a rate fixed upon a sliding scale, as I understood you?

A. I did.

Q. It is equally necessary to intelligently fix any rate, isn't it?

A. Yes. Pardon me for adding an explanation there, that is this, that as a matter of my own judgment I have always objected to the fixing of a rate for any more than—a single rate—for anything more than a very short time, for it appears to me that a change in the cost of raw material or productive labor would result in a change in the cost of gas and consequently might be unjust either to the company or to its consumers.

Complainant moves to strike the explanation made by the witness as irrelevant and immaterial, in view of the fact that under the law of this state a rate cannot be fixed for any specific time.

Q. Now, on cross examination, commencing on page 2386, you were asked about that, what your Exhibit 23 showed, and you were asked this question: There is one thing I want to get straightened out about your report, defendants' Exhibit 23, is that supposed to show the reproduction cost of the plant or not? And you answered: "No." That is correct, is it not?

A. That is correct.

Q. Then on page 2387 you were asked, referring to this report: "Q. Then it is not intended to show the value of the plant at this time, is it? A. At what time? Q. This time, today? A. Only in so far as the cost of materials and labor correspond with the cost of materials and labor used in gas works at the time in which these structures were put in." You so testified?

A. I did.

Q. That is correct?

A. That is correct.

2793 Q. So that if any of the items in your report Exhibit 23 happen to be the same as the corresponding items for the reproductive value of the plant, it is a mere coincidence?

A. It is.

Mr. GUERNSEY: I think that is all, except Mr. Brennan, did you get that letter of the 17th?

Mr. BRENNAN: Not yet.

Mr. GUERNSEY: There is one other question I want to ask the witness.

Q. With reference to these Massachusetts reports, in your report here, you do not claim that these figures in the report are correct, do you?

A. Not with a great degree of precision; sufficiently so for the purpose for which they are used.

Q. That is true enough, if as you said yesterday, they haven't any particular bearing in Des Moines. Referring to the first table on page 94 of your report is there any one of the figures in that table showing the sales per capita, which is correct?

A. I should say that all the figures there are near enough correct for the purpose for which they are intended.

Q. That don't answer my question. I asked you whether you say any of the figures in your columns showing the sales per capita and your average sales per capita in the first table set out on page 94 of Exhibit 23 are correct?

A. If you mean absolute correctness——

Q. I mean correct as shown, checking the source from which you take them?

A. You mean absolute correctness?

Q. I do not mean within ten decimals; I mean whether those figures are right, or within one decimal?

2794 A. I cannot alter the statement I made. If I felt the necessity of greater accuracy, I would have endeavored to obtain it; they are sufficiently accurate and correct for the purpose for which they are intended, showing the relation——

The MASTER: Are they correct?

A. Until correctness is defined, until the use of that word is defined, I cannot very well answer, although I will say they are correct enough for any use I have made of them.

The MASTER: You don't say they are absolutely correct?

A. I do not.

Q. For instance, take your last average figure, and you have 57.60 and that ought to be 63.28 ought it not?

A. I have not the last figure before me. That is correct for the purpose for which it is used. 6000 I should say would be about a fair average.

Q. Will you do this, Professor, will you give us the cities that are referred to where the average figures are taken for your per capita sales, at the $2.25 cent rate for 1901?

A. I could not give you that without going back to my office?

Q. Will you furnish them to us later here?

A. I will be very glad to.

Q. Also the cities upon which these figures as to the $2 rate here are based?

A. You see there are three $2 rates, groups.

Q. Not in this same table I am talking about.

A. There is a group for 1901 and group for 1907 and for 1910.
Q. I want all of them, of course.
A. You mean the three groups?
Q. Yes.
A. I thought you had that all worked out.

2795 Q. We have it all figured out but we do not find any figures to be right, and that is why I am asking for the information, and to avoid any chance for error I would like to have you give us the cities taken in each column?

Mr. BRENNAN: That is in the table shown on page 94?
Mr. GUERNSEY: The table at the top of page 94.

Q. Will you furnish us that information?
A. I will if I can. I presume we do not substantially differ—just a fall in the price of gas will always result in increased sales of it.
Q. I am talking about these computations based on the Massachusetts reports; we get as the final result for one year's increase instead of 1.79 1.31 which is something more than 25 per cent less than your figure?
A. But you get an increase in both cases, and that is all I *I* was trying to show you.
Q. All you claim for the figures is that they show an increase but not the amount of it?
A. Yes.
Q. Now will you furnish us this list of cities giving the list for each rate for each year, 1901, 1907, and 1910, referred to in the first table on page 94?
A. I will have it dug up if my counsel so desires, as soon as I can get access to my data.

Mr. BRENNAN:

Q. You wanted to show approximately the results of the reduction in price of gas?
A. That is all that I wished to do.

Excused.

2796 W. F. DOUTHIRT, being first duly sworn on part of defendants, examined in chief by Hon. H. W. Byers, testified:

Q. Where is your home, Mr. Douthirt?
A. In Philadelphia.
Q. And what is your business, please?
A. Secretary of the United Gas Improvement Company.
Q. How long have you been secretary of that company?
A. I think about six or seven years.
Q. Were you secretary of the company prior to 1906?
A. I was in the employ of the company prior to 1906. The date when I was elected secretary has escaped me. I think it was prior to 1906.
Q. When was that corporation organized, do you know, the United Gas Improvement Company?

Objected to as not the best evidence and incompetent on that account.

A. Well, I can only make a guess. I think it was some time prior to 1890.

Q. And what is the business of the United Gas Improvement Company?

Complainant interposes the same objection last made.

A. It operates under a lease from the municipality of Philadelphia the gas works owned by the municipality. It operates a construction department which builds water gas apparatus for any gas company in the United States who may desire to buy such apparatus from the United Gas Improvement Company. It also is a share holder in a number of gas companies and gas and electric companies and gas and electric and traction companies in different parts of the country.

2797 Q. And who is its president?

A. Thomas Dolan.

Q. What are your duties as secretary?

A. My duties as secretary are to keep the corporate records.

Q. Is that what you do do?

A. Oh, I do a good many things besides that.

Q. What other duties do you have besides keeping the corporate records?

Objected to on part of complainant as being immaterial.

A. I am a member of two or three bars and I do a good deal of legal work in connection with the company's affairs. I also have more or less to do with the accounting, and I am a member of a good many boards of directors of companies in which the United Gas Improvement Company is a shareholder. I render such services as I can, general, attending to matters and the general business of the companies in which it is interested, in my capacity as director of the various concerns.

Q. Are you also a stockholder in the company?

A. The United Gas Improvement Company—I am not.

Q. What relation does the United Gas Improvement Company bear to the Allentown Gas Company of Pennsylvania?

Objected to on part of complainant as wholly irrelevant and immaterial as to any controversy here.

A. It is a shareholder.

Q. What do you mean by shareholder?

A. It owns stock in the Allentown Gas Company.

Q. Does it own all the stock?

Complainant interposes the same objection last made.

A. I do not recall; if it does not own it all, it owns a large majority of it.

2798 Q. Why do you say recall, it owns it all?

A. Because I don't.

Q. Are you not an officer of that Company?
A. I think I am; I am not sure.
Q. You are drawing a salary there, are you not?
A. I think not.
Q. Are you sure about that?
A. I think not.
Q. Well, at any rate, it owns a majority of the stock?
A. Yes, I am safe in saying that.
Q. The Burlington, Iowa, Gas Light Company, what relation does the United Gas Improvement Company bear to that company?
A. It owns stock in that company.
Q. How much of that stock?
Judge CARR: We ask to have the same last objection made continued.
A. I cannot tell you any more than say that it owns a substantial majority.
Q. All of it, don't it?

Same objection.

A. I think not.
Q. Is there more than a half a dozen shares held by parties outside?

Same objection.

A. I really couldn't say.
Q. You are an officer of that company?

Same objection.

A. I think not in the Burlington Gas Light Company.
Q. Do you know who the treasurer of the company is?

Same objection.

2799 A. Yes.
Q. Who is it?

Same objection.

A. Mr. S. T. Bodine.
Q. What relation does Mr. S. T. Bodine bear to the United Gas Improvement Company?

Same objection.

A. He is 1st vice president.
Q. Mr. Walton Clark is an officer of the Burlington Company?

Same objection.

A. I do not recall whether Mr. Clark is or not. If you will let me have Poor's Manual I will give you the whole thing.
Q. I want to know what you know about it?

Same objection.

A. All right. I don't recall whether Mr. Clark is or not.
Q. Mr. Clark is an officer of the United Gas Improvement Company?

Same objection.

A. Yes.

Q. And Mr. Lewis Lilley is an officer of the Burlington Gas Light company?

Same objection.

A. I think Mr. Lilley is in the Burlington Gas Light Company.

Q. What relation does he bear to the United Gas Company?

Same objection.

A. Mr. Lilley is the 4th vice president and treasurer.

Q. And Mr. G. A. Pearson, does he have any relation with the Burlington Gas Light Company?

Same objection.

A. My recollection is Mr. J. A. Pearson is purchasing agent of the Burlington Gas Light Company.

2800 Q. What relation does he bear to the United Gas Improvement Company?

Same objection.

A. He is purchasing agent of the United Gas Improvement Company.

Q. Now, Mr. Douthirt, you are also secretary of the Des Moines Gas Company?

Same objection.

A. Yes.

Q. And how long have you been such?

Same objection.

A. Let me see. The company was organized in 1906. It was some time subsequent to its organization, according to my recollection, I was not elected secretary immediately upon the organization of the company; possibly a year or two later than 1906.

Q. Say in 1907?

Same objection.

A. Possibly.

Q. What relation if any do you bear to the Capital City Gas Light Company?

Same objection.

A. I think I never was an officer or director of that company; I don't recall that I was.

Q. Now as secretary of the Des Moines Gas Company, what are your duties?

Same objection.

A. I keep the corporate records, and I have been in attendance at this trial and spent a good deal of time in consultation with the attorneys prior to the beginning of this trial.

Q. You have been one of the counsel, have you not?

Same objection.

A. Oh, I think not.

2801 Q. Haven't you been acting in that capacity here?

Same objection.

A. Well, you may form your own conclusions.

Q. What else, what other duties if any; you don't mean it is one of your duties to try the lawsuits of the company?

Same objection.

A. Oh, no; I haven't tried a lawsuit for fifteen years.

Q. As I understand you, you are simply here as a witness the same as these other gentlemen?

Same objection.

A. I didn't come here as a witness.

Q. What particular duty do you have here?

Same objection.

A. Oh, much the same as Mr. Haines, except that he was called as a witness, and I am here as an officer of the company to help in any proper way I can.

Q. Have you any other duty in connection with the business of the Des Moines Gas Company in addition to what you have said, if so, I wish you would give it to me?

Same objection.

A. Every month in Philadelphia we get these 26 reports Mr. Haines spoke of; they are examined and the results are compared with the results of other companies in which the United Gas Improvement Company is a shareholder, and we make suggestions as to where the results may be improved.

Q. What do you mean by we?

Same objection.

A. Everybody in the organization, myself included.

Q. You mean in the United Gas Improvement Company?

Same objection.

2802 A. Yes.

Q. Now, is there anything else you know of?

Same objection.

A. I think I can't be more specific than that.

Q. You get a salary do you from the company?

Same objection.

A. Yes.

Q. When did you begin to draw this salary?

Same objection.

A. It was either late in 1909 or the beginning of 1910; I can't recall definitely.

Q. Well, how was it with reference to about the time that the company began to get ready to have a valuation put upon its property?

Same objection.

A. It was practically a year before that time.

Q. About a year you think?

Same objection.

A. Yes, about a year.

Q. How was it with reference to the time that the United Gas Improvement Company engineers began to make schedules and prepare data for replacement valuations?

Same objection.

A. About a year before that.

Q. You are pretty sure about that now?

Same objection.

A. My recollection is that Mr. Brodnax testified that he came here early in November 1910, and I told you a moment ago that this salary commenced either late in 1909 or at the beginning of 1910.

Q. Have you got the records with you that you have been keeping as secretary?

Same objection.

2803 A. You mean are they in the court room?

Q. Yes, or where you can reach them?

Same objection.

A. Oh, yes.

Q. I wish you would have them brought in after dinner, so that I can have them here. Now as secretary, I assume you attend the meetings of the board of directors?

Same objection.

A. Yes, I attend most of them; occasionally I am not there.

Q. And you make up the record at the time the meeting is held so that you are familiar with what is done by the board of directors?

Same objection.

A. Yes, at all those meetings at which I am present; I have not been present at all of them.

Q. Who are the board of directors of the Des Moines Gas Company?

Same objection.

A. Mr. Samuel T. Bodine, Mr. Walton Clark, Mr. Lewis Lilley, Mr. Jansen Haines and myself.

Q. Is Mr. Jansen Haines a director now?

Same objection.

A. Yes.
Q. I thought he was president?

Same objection.

A. He is.
Q. And director too?

Same objection.

A. Yes.
Q. Now, Mr. Bodine, what is his official title in the Des Moines Gas Company now?

Same objection.

2804 A. First vice president.
Q. And what is his relation to the United Gas Improvement Company?

Same objection.

A. First vice president.
Q. And Walton Clark, what is his official title in connection with the Des Moines Gas Company?

Same objection.

A. Second vice president.
Q. And with the United Gas Improvement Company?

Same objection.

A. Third vice president.
Q. And Mr. Lewis Lilley, what is his connection with the two concerns?

Same objection.

A. Which one.
Q. The Des Moines Gas Company and the United Gas Improvement Company?

Same objection.

A. He is treasurer of the Des Moines Gas Company and he is fourth vice president and treasurer of the United Gas Improvement Company.
Q. Now, who are the directors of the United Gas Improvement Company?

Same objection.

A. Samuel T. Bodine——
Q. He is a director of the Des Moines Gas Company?

Same objection.

A. Yes. Randal Morgan, C. A. Griscomb, Rudulph Ellis, William Wood, Morris L. Clothier; and in that connection may I say that nobody knows owing to certain peculiarities in the charter, whether the president, Mr. Thomas Dolan, is a director or not. The charter provides, as I have been informed, that the affairs of the

corporation shall be controlled by the president and the six
2805 directors. The president is elected by the stockholders and the six directors are elected by the stockholders.

Q. You do not give me the name of Mr. Dolan for the reason that it is not known that he serves on the board?

Same objection.

A. He is president of the company though.

Q. Now, who owns the stock of the Des Moines Gas Company?

Same objection.

A. The United Gas Improvement Company owns substantially all of it.

Q. Is there any part of it that they don't own?

Same objection.

A. According to my recollection there is not.

Q. And never has been?

Same objection.

A. That I think is right.

Q. And the same is substantially true of the Capital City Gas Light Company?

Same objection.

A. I can't answer you as to that, General Byers.

Q. Well, Mr. Secretary, you have the records of the two companies, haven't you?

Same objection.

A. Yes.

Q. You can answer it, can you not, by investigation?

Same objection.

A. I can give you the names of the stockholders as appears by the minute books which I have her-.

Q. That wouldn't be a truthful statement as to who was owner of the stock, would it?

Same objection.

A. Well, it might in part.

2806 Q. Well, not very much of a part, would it; I'll get to that later though; I want to follow another line for a few minutes. As I understand you, you now are secretary of the United Gas Improvement Company?

Same objection.

A. Yes.

Q. And as such secretary you keep the records of the corporation, that is, the minutes of the meetings of the board of directors and assist in the inspection and examination of reports that come in from

corporations and concerns that the United Gas Improvement Company is interested in, either as owners or owners of stock?

Same objection.

A. Yes, except that the United Gas Improvement Company does not own any properties in any other way.

Q. Except through the stock ownership?

Same objection.

A. Except through the stock ownership.

Q. Then I assume from your statement as to what your duties are that you know just the manner in which the books of these concerns in which the United Gas Improvement Company *wons* all or a majority of the stock and the manner in which their accounts are kept, and the manner in which they make their charges on their books?

Same objection.

A. Generally speaking, yes.

Q. So that you have been informed right along for the last six years by an examination of the reports sent in from Des Moines just what was being charged to operating expenses in Des Moines, have you not?

Same objection.

A. In a general way, yes.

2807 Q. Right at that point, may I ask you what has been the practice of the Company during the last five years, while you have been secretary of it, with respect to money that was paid out by the Company in the way of donations, either for charitable purposes or business purposes, or contributions to the officers or anything of that kind.

Same objection.

A. It has been charged to operating expenses.

Q. Everything that has been paid out at this office in the way of charity or in the way of contributions and business and to officers has been charged up to operating expenses?

Same objection.

A. I think so.

Q. Will you give me when you come in after dinner a list of these contributions for the last four or five years—maybe it would *it would* be fair for me to ask you if you know, I don't know whether you know or not, whether those expenditures are so shown on the books that you can readily pick them out?

Same objection.

A. Why I think they are. Whether it could be done at the noon recess, or not, covering the period you mention, I have very much doubt.

Q. Well, you as an officer of the company have known right along —take for instance this item of $2,000 being contributed to the

local so-called Booster Committee—you know that item was being charged to operating expenses?

Same objection.

A. Yes, I voted for it at the meeting of the board of directors.
Q. What was the purpose you and the company had in mind in making that contribution, what was it for?

Same objection.

A. To help the city of Des Moines.
2808 Q. Was that the purpose of it?

Same objection.

A. Yes.
Q. And not to help the Gas Company?

Same objection.

A. Only incidentally, as the Gas Company might be helped by any general improvement in the city.
Q. So you thought it would be entirely proper to have the gas consumers of Des Moines contribute through your concern $2,000 for that purpose, that was your idea?

Same objection.

A. Yes.
Q. Was that your idea as to the contributions to the Y. M. C. A. Y. W. C. A.—if there is such a concern—and these other associations here?

Same objection.

A. Yes.
Q. So that all this class of contributions has been charged into the operating expenses and gone in with the cost of making gas in Des Moines?

Same objection.

A. Yes.
Q. I would like to have you have some one of your very active young men furnish me a list of that, say for the last four or five years and the amount of it. Going back to the Allentown, Pennsylvania, Gas Company, Mr. Bodine is treasurer, isn't he?

Same objection.

A. According to the best of my recollection.
Q. Mr. Clark is vice president?

Same objection.

A. I think he is.
2809 Q. Mr. Lewis Lilley is treasurer?

Same objection.

A. Yes.

Q. Mr. Douthirty is secretary, is he not?

Same objection.

A. Yes.
Q. Mr. Pearson is purchasing agent?

Same objection.

A. Yes.
Q. Now, Mr. Bodine, what is his salary in Allentown, do you know?

Same objection.

A. I don't know.
Q. What is yours?

Same objection.

A. I don't know.
Q. You don't know; who does know?

Same objection.

A. The books of the Allentown Company will show.
Q. When do you get your money?

Same objection.

A. It comes in once a month I think.
Q. Do you get it?

Same objection.

A. No.
Q. Who gets it?

Same objection.

A. The United Gas Improvement Company.
Q. It gets your salary from here too, don't it?

Same objection.

A. Yes.

Q. I find Mr. Walton Clark on the salary list here for
2810 $1,800. Do you know when he first got on the salary list?

Same objection.

A. I think at the same time I did.
Q. Just tell the Master how it come that you both got on at that time and why you got on?

Same objection.

A. Well, Mr. Clark and the various members of his force, Mr. Lilley and the members of his force, and myself had been rendering a great deal of service in connection with the Des Moines Gas Company for a good many years; the Des Moines Gas Company had never paid anything for it and it was finally determined that it was proper that the services should be paid for and the appropriate way to do it seemed to be to pay us salaries as officers of the company.

Q. You say the Des Moines Gas Company had never paid anything; what do you mean by that; had never paid anything to you or the United Gas Improvement Company?

Same objection.

A. Never paid anything to the United Gas Improvement Company or to any of its officers who were not residents in Des Moines.

Q. Well, how was it going to help you any to have this $1,600 if it went to the United Gas Improvement Company?

Same objection.

A. It wasn't going to help me personally.

Q. This was just another way of getting a dividend on their stock and calling it salary?

Same objection.

A. No, it was a way of getting compensation for services of all sorts rendered in behalf of this company by all the organization of the United Gas Improvement Company.

2811 Q. In addition to Walton Clark, vice president, $1,800, I find Lewis Lilley here, the treasurer, at $1,600. When did he get on the pay roll here?

Same objection.

A. I think the sametime.

Q. Mr. J. A. Pearson, purchasing agent, $2,500; when did he get on?

Same objection.

A. I think the same time.

Q. I find by an examination of the authorities on gas properties and electric light properties that Mr. Bodine is an officer of one kind or another in about, between 30 and 45 companies; does he get $2,500 from each?

Same objection.

A. No.

Q. How much does he get?

Same objection.

A. I don't know.

Q. Let us take your own case—that is perhaps a better way; do you have anything to do with the accounts of the United Gas Improvement Company—I think you said a moment ago a part of your duties was to look after the accounting?

Same objection.

A. Yes, in a general sort of way.

Q. You know in a general sort of way about all these salaries, don't you?

Same objection.

A. Very general sort of way.

Q. How general would you say?

Same objection.

A. Well, I couldn't give you figures.

2812 Q. Let us take your own case and run through it a while and see—passing Allentown—the next is Burlington Gas Light Company, and I find Mr. Bodine and Mr. Lilley and Mr. Pearson and I think yourself fill practically the same positions with the Burlington Gas Light Company that you do with the Des Moines Gas Company; what is your salary?

Same objection.

A. I don't think I am an officer of the Burlington Gas Light Company.

Q. Mr. Bodine is?

Same objection.

A. Yes.

Q. And Mr. Libbey is?

Same objection.

A. Yes.

Q. And Mr. Pearson is?

Same objection.

A. Yes.

Q. Mr. Pearson occupies exactly the same relations to the Burlington Company which he has as purchasing agent?

Same objection.

A. Yes, he is purchasing agent. Wherever you find him an officer of the company he is purchasing agent.

Q. What dies he get in Burlington?

Same objection.

A. I couldn't tell you.

Q. Does he get a salary?

Same objection.

A. I think he does.

Q. That goes to the United Gas Improvement Company?

Same objection.

2813 A. Yes.

Q. What is your salary with the United Gas Improvement Company?

Same objection.

A. I refuse to state.

Q. I did not ask that question, Mr. Douthirt, out of any idle curiosity at all. I was surprised this information was not furnished originally by the company, because I think it is entirely competent and I think it is absolutely necessary for the Master to have this

information, all of it, in order to reach anything like a safe and reliable conclusion here, and these question- are for the express purpose of getting at the exact facts. If I thought the question of your salary would not cut any figure I would not ask the question. I do not care to press it, if you do not care to state.

Mr. GUERNSEY: I would decline to state if I was you.

Judge CARR: I think the salary he may get from the United Gas Improvement Company has nothing to do with the issues in this case.

The MASTER: Well, it looks that way to me; I suppose these various salaries make up his salary.

Mr. BYERS: The purpose is to get dividends under the name of salaries.

Judge CARR: Mr. Douthirt has stated frankly what is done, and further than that, it seems to me what salary he gets from the United Gas Improvement Company is in no way material here, and I think counsel knows it.

Mr. BYERS: That is a slight reflection on my decency.

The MASTER: The main question is whether or not the company here is entitled to have the amount of those salaries taken out of the expense; that is the main question.

2814 Mr. BYERS: The question here, Mr. Master, is whether this ordinance, if it is put in operation, from my standpoint, would result in confiscating the property of this Gas Company. I have in mind what I think is a very important reason why this testimony would be proper, if we can get it. I have already told the witness I would not press it if he did not care to say.

Mr. GUERNSEY: The only question is whether these services were worth what was charged for them, not how it was paid or where the money ultimately went.

The MASTER: I don't know about that. There is a serious question, another question whether under the present showing the salary could be charged to operating expenses at all or not.

Judge CARR: That is the Des Moines salary here?

The MASTER: If it is paid to somebody else.

Mr. BYERS: Let me state briefly what I have in mind; here is the view I have of this situation: Here is a controversy now resting entirely upon complainant's charge that this ordinance will in its operation result in confiscating the property of the Des Moines Gas Company. Now that question involves in its settlement an accurate and intelligent knowledge of all of the operations of the Des Moines Gas Company and every other concern interested with it in the operation, and my notion about this line of testimony is that the Master ought to know when he comes to make up his findings just what the relation of all these parties are, just where this money is going and the purpose for which it is being used and just the manner in which the business is being done; when he has that then the question as to how it may affect the final result is one the

2815 Master will have to work out himself. It is my judgment and I thought it was the complainant's duty to furnish this

testimony themselves, not only to furnish the testimony, but to furnish the books and records, and it is my purpose now to do that for them.

The MASTER: As I understand it, you are not pressing the question?

Mr. BYERS: I don't care, if he don't want to say. I have no doubt it is enough; I don't mean that in any offensive way either.

Q. Let us take the Charleston Consolidated Railway & Lighting Company. Are you any officer in that concern?

Same objection.

A. Yes.

Q. What relation does the United Gas Improvement Company bear to that concern?

Same objection.

A. Owns the majority stock.

Q. What is your salary with that concern?

Same objection.

A. I don't get any salary there—nothing.

Q. Mr. Bodine is an officer in that company?

Same objection.

A. No, I think not.

Q. Mr. Lilley?

Same objection.

A. I think Mr. Lilley is treasurer, yes.

Q. How about Mr. Pearson, is he purchasing agent?

Same objection.

A. Yes.

2816 Q. Does he get the same salary there he does with the Des Moines Company?

Same objection.

A. I don't think he gets any salary there.

Q. Can you give the Master any reason why he should have $2,500 from the Des Moines Gas Company and nothing from the Charleston Consolidated Railway & Lighting Company?

Same objection.

A. No.

Q. The Chester County Gas Company, Westchester, Pa., what relation does the United Gas & Improvement Company bear to that concern?

Same objection.

A. It owns the majority stock.

Q. Mr. Bodine is president, is he?

Same objection.

A. I think he is.
Q. Mr. Lilley is treasurer?

Same objection.

A. I think so.
Q. Mr. Pearson is purchasing agent?

Same objection.

A. I think so.
Q. You are the secretary?

Same objection.

A. That is my recollection.
Q. What is your salary there?

Same objection.

A. I don't recall.
Q. Is it more or less than at Des Moines?

Same objection.

A. I don't recall whether I get any salary there at all or not.

Q. You perform practically the same services there that
2817 you do here?

Same objection.

A. Well, it is a very much smaller property and does not require as much time.
Q. Do you remember whether you get any?

Same objection.

A. No, I do not.
Q. How about Mr. Bodine or Mr. Lilley?

Same objection.

A. I don't know.
Q. And Mr. Pearson?

Same objection.

A. I don't recall.
Q. Mr. Pearson gets a salary charged up against all the concerns that he acts as purchasing agent for?

Same objection.

A. I couldn't tell you that General Byers. You see there is a list of forty or fifty of them. I think he gets a salary from most of them, but whether from every one or not, I really couldn't say.
Q. There are some he does not get a salary from?

Same objection.

A. I think so.

Q. This Charleston Consolidated Railway & Lighting Company, do you know how that is being operated in that city, under what arrangement with the city?

Same objection.

A. The Charleston Consolidated Railway & Lighting Company is the *is the* lessee of the railway, gas and electric properties is Charleston, which are owned by the Charleston Consolidated Rail-
2818 way Gas & Electric Company. Now does your question address itself to the franchises under which the properties are operated.

Q. What rate do you get for gas there?

Same objection.

A. I think it is $1.25.

Q. Under what arrangement with the city?

Same objection.

A. There was an ordinance passed within the last two years I think, and I think the price is subject to regulation by the city, according to my best recollection.

Q. That don't quite answer my question.

Same objection.

A. You are asking me to recall the terms of a franchise.

Q. The Concord, New Hampshire, Light & Power Company, you are an officer in that concern?

Same objection.

A. I think not, according to the best of my recollection I am not.

Q. And Mr. Lilley and Mr. Bodine and Mr. Clark?

Same objection.

A. According to the best of my memory Mr. Lilley is and Mr. Bodine and Clark are not.

Q. How about Mr. Pearson, is he the purchasing agent?

Same objection.

A. According to the best of my recollection he is.

Q. The Connecticut Railway & Lighting Company, New Haven, Conn., are you an officer in that?

Same objection.

A. Yes, I am secretary of that.

Q. Do you know what your salary is there, Mr. Douthirt?

Same objection.

A. Yes.

Q. About how much?

2819 Same objection.

A. Nothing.
Q. And Mr. Bodine?

Same objection.

A. No, Mr. Bodine is not an officer of that company.
Q. Mr. Pearson?

Same objection.

A. No.
Q. Mr. Lilley?

Same objection.

A. Mr. Lilley is treasurer.
Q. Now this company that I am just asking about, is it a gas company, the Connecticut Railway & Lighting Company?

Same objection.

A. In part, yes.
Q. What relation does the United Gas Improvement Company bear to it?

Same objection.

A. It owns the majority of the stock.
Q. Has it so owned the majority of the stock ever since you have been secretary?

Same objection.

A. Yes.
Q. The Konshohaken Gas Light Company, are you secretary of that concern?

Same objection.

A. I don't recall now whether I am or not.
Q. What relation does the United Gas Improvement Company bear to that Company?

Same objection.

A. Owns the majority of the stock.
2820 Q. That means all of it?

Same objection.

A. No.
Q. How much in a general way is not held by the company, more than a share or two?

Same objection.

A. I couldn't tell you.
Q. A very small part of it, if any?

Same objection.

A. In that particular case, probably a very small part if any.
Q. The Consumers' Gas Company, Reading, Pa. You are secretary of that company?

Same objection.

A. Yes.
Q. Mr. Pearson is the purchasing agent?

Same objection.

A. Yes.
Q. Mr. Clark is the president?

Same objection.

A. No.
Q. What is his official title?

Same objection.

A. Vice president.
Q. Who is the president?

Same objection.

A. A Mr. Custer.
Q. Mr. Lilley is treasurer?

Same objection.

A. Yes.
Q. What relation does the United Gas Improvement Company bear to that concern?

2821 Same objection.

A. It owns the minority stock.
Q. Who owns the balance, do you know?

Same objection.

A. Quite a number of people.
Q. Do you have stock in it?

Same objection.

A. No.
Q. What is your salary?

Same objection.

A. Nothing.
Q. You got no pay there?

Same objection.

A. No.
Q. You don't have any stock?

Same objection.

A. No.
Q. Yet you are an officer in the company?

Same objection.

A. Yes.
Q. How large a concern is it?

Same objection.

A. I think it has got about 100 miles of mains.
Q. Does the United Gas Improvement Company get monthly reports from that concern?

Same objection.

A. Yes.
Q. You look them over?

Same objection.

A. Yes.
Q. And perform the same kind of service that you do to
2822 the Des Moines Gas Company?

Same objection.

A. In part, yes.
Q. But you get no salary?

Same objection.

A. No.
Q. Now, the Dauphin County Gas Company, are you secretary of that Company?

Same objection.

A. I think not.
Q. Mr. Clark is president or vice president?

Same objection.

A. I don't recall.
Q. Mr. Lilley is treasurer, isn't he?

Same objection.

A. I am not sure of that.
Q. Mr. Pearson is the purchasing agent?

Same objection.

A. No, I think not. May I tell you why?
Q. If you wish.
A. The Dauphin County Gas Company property is leased to the Harrisburg Gas Company and it is not an active corporation.
Q. Is the stock owned by the United Gas Improvement Company?

Same objection.

A. The United Gas Improvement Company owns the majority.
Q. It is a live concern?

Same objection.

A. Yes, but not operating its property.

Q. It makes regular reports for its receipts and expenditures?

Same objection.

A. Its reports are very simple; simply consist of collecting rent for the property.

2823 Q. And reporting to the United Gas Improvement Company?

Same objection.

A. Yes, to its own officers.

Q. The Equitable Illuminating Gas Light Company of Philadelphia, you are secretary of that Company?

Same objection.

A. No.

Q. It seems to be so given?

Same objection.

A. That is a mistake.

Q. You are a director?

Same objection.

A. Yes.

Q. Is that a live company furnishing gas?

Same objection.

A. Yes.

Q. And what relation does it bear to the United Gas Improvement Company?

Same objection.

A. The United Gas Improvement Company owns the majority of stock.

Q. In this case that means substantially all?

Same objection.

A. No, I think in this case, decidedly not.

Q. Do you have stock in this company?

Same objection.

A. No.

Q. The Essex & Hudson Gas Company of Newark, N. J., are you secretary of that concern?

Same objection.

A. Yes.

2824 Q. What kind of a company is that, what does it do?

Same objection.

A. Owns the gas works.

Q. About how large an institution is it as to miles of main, capacity, or anything like that?

Same objection.

A. I don't know that I can give you those things. I can tell you in another way, if you desire, about the size of the property.

Q. About what is the population?

Same objection.

A. The City of Newark is, I think, upwards of 200,000; and then this company also supplies numerous suburbs like Orange, Mt. Claire, these suburban towns to the west and north of Newark; so I expect it supplies a population of from 300,000 to 400,000.

Q. So that the output would be quite large?

Same objection.

A. Yes.

Q. Who is the president of that company?

Same objection.

A. A Mr. John F. Shanley.

Q. Who is the vice president?

Same objection.

A. I think Mr. Clark and Mr. Lilley are both vice presidents of that company.

Q. Does Mr. Pearson act as purchasing agent for that company?

Same objection.

A. No.

Q. Are there any salaries paid there to yourself and Mr. Clark and Lilley?

Same objection.

2825 A. No, that is also a leased company and is not in active operation of its property.

Q. All it does then is to collect its rent and report, as the Equitable?

Same objection.

A. No, as the Dauphin County Company.

Q. Now the Fulton County Gas Electric Company—this Essex and Hudson Gas Company, who owns the stock in that concern?

Same objection.

A. The United Gas Improvement Company owns the majority.

Q. Does that mean substantially all of it?

Same objection.

A. Decidedly not.

Q. The Georgia Railway & Electric Company of Atlanta, Ga., what is the business of that corporation?

Same objection.

A. What its name indicates, railway and electric.

Q. Does it make gas?

Same objection.

A. I don't think that company itself makes gas. My under-

standing is it owns a large majority of the stock in the Atlanta Gas Light Company, which does make gas.

Q. What relation if any does the United Gas Improvement Company bear to the Atlanta Company?

Same objection.

A. To the Georgia Railway & Electric—it owns a minority of the stock.

Q. Are you an officer of the company?

Same objection.

A. No.

Q. Now, the Harrisburg Gas Company of Harrisburg,
2826 Pa., what is the business of that concern?

Same objection.

A. Manufacturing and furnishing gas.

Q. It is not a leased concern?

Same objection.

A. No.

Q. It is alive?

Same objection.

A. Yes.

Q. Mr. Bodine is president?

Same objection.

A. Yes, I think he is.

Q. Mr. Lilley is treasurer?

Same objection.

A. I think so.

Q. You are secretary?

Same objection.

A. Yes.

Q. Mr. Pearson is purchasing agent?

Same objection.

A. Yes.

Q. How much of a concern is that in mains or population?

Same objection.

A. My recollection is that Harrisburg is a place of between 60 and 90 thousand.

Q. This is the only gas company there?

Same objection.

A. Yes.

Q. How long have you been secretary of that company?

Same objection.

A. I guess three or four years, possibly longer.

2827 Q. What relation does the United Gas Improvement Company bear to that concern?

Same objection.

A. It owns the majority of the stock.

Q. Does that mean practically all of it?

Same objection.

A. No.

Q. Now what salary do you get there?

Same objection.

A. I don't recall whether I get any or not.

Q. And does that company make regular reports to the United Gas Improvement Company?

Same objection.

A. Yes.

Q. Has it been ever since you were secretary?

Same objection.

A. Yes.

Q. You have assisted in examining them and checking them up and all that sort of thing?

Same objection.

A. Yes.

Q. Doing substantially the same work with respect to those reports that you have in Des Moines?

Same objection.

A. With respect to the reports, yes.

Q. Do you know what Mr. Pearson's salary is?

Same objection.

A. I don't.

Q. Do you object to telling me what Mr. Pearson's salary is with the United Gas Improvement Company?

Same objection.

2828 A. I don't know what it is.

Q. That matter has not come under your supervision, or even been called to your attention in any way through your labor as accountant or in examining the books, or in the votes of the directors, or anything of that kind?

Same objection.

A. I may have known what Mr. Pearson's salary was at some time I don't know now.

Q. It is all fixed by these directors at these several meetings?

Same objection.

A. Oh, yes.

Q. So that you must have known at some time what the salaries were?

Same objection.

A. He has been in the employ of the company a great deal longer than I have and his salary was fixed before my time; whether it has been changed since that time I don't recall. If it has been, I very likely made a record of it.

Q. Will you tell us just how you make the record of the directors' meetings of the Des Moines Gas Company; how the business of the meeting is carried on and what you do?

Same objection.

A. Well, the principal business at most of the meetings is the consideration of appropriations for expenditures for betterments. They come before the board and they are examined, and if the expenditures for laying additional mains or for any betterments or improvement appear to be necessary and proper and wise, they are authorized, and the entry is made on the minutes; that constitutes a pretty large part of the business of the board; we go into these matters pretty carefully.

Q. Let us take a concrete case; suppose Mr. Haines de-
2829 cides that he ought to have a new generator, I wish you would just tell now in as brief way as you can and yet give us the information just how that generator would be provided for?

Same objection.

A. Mr. Haines would take the matter up with Mr. Walton Clark or with some member of Mr. Clark's engineering organization and they would consider the matter, and if they agreed with Mr. Haines or Mr. Vincent that the apparatus was reasonably necessary, they would then bring the matter before the board and present their reasons and a statement of the estimated cost and the board would determine the matter.

Q. Well, now, would this correspondence be with Mr. Clark or with you?

Same objection.

A. In the case you mention, being an engineering matter, it would be with Mr. Clark.

Q. And Mr. Clark is vice president of the Des Moines Company and one of the vice presidents of the United Gas Improvement Company?

Same objection.

A. Yes, he is second vice president of the Des Moines Gas Company and third vice president of the United Gas Improvement Company, and he is the head of the operating department, as we call it, which includes construction and engineering and all the matters incident to the operation of the properties in an engineering sense.

Q. How long has Mr. Clark occupied that relation to the United Gas Improvement Company?

Same objection.

A. Well, it ante-dates my connection with the company.

Q. Do I understand you had no connection with the com-
2830 pany prior to your election as secretary?

Same objection.

A. Yes, I was in the employ of the company prior to my election as secretary.

Q. And for how many years?

Same objection.

A. I can best answer you by giving you the date I entered the employment of the company, which was November 1, 1902. I know Mr. Clark was at the head of the operating department at that time, and I know from what I have learned since I have been in the employ of the company, he was at the head of the operating department at least ten years prior to that time.

Q. Mr. Clark was also one of the officers of the Capital City Gas Light Company, was he not?

Same objection.

A. Whether Mr. Clark was actually an officer of the Capital City Gas Light Company, I don't know; but in any event he was an officer of the United Gas Improvement Company at the time when that company owned a majority of the stock in the Capital City Gas Light Company.

Q. Now I wish you would bring with you this afternoon the minute books of the Capital City Gas Light Company and the Des Moines Gas Company.

At this time an adjournment was taken until 1:30 P. M.

2831 1:30 P. M. WEDNESDAY, *August* 23, 1911.

W. F. DOUTHIRT being continued on direct examination by Hon. H. W. Byers, testified as follows:

Q. What is the title or name of the officer or position with the United Gas Improvement Co., the person who *adutis* the accounts of these several companies who represents the U. G. I. in auditing?

Same objection.

A. The man who visits the different companies in which the United Gas Improvement Company is interested and actually does the work of auditing is called a traveling auditor.

Q. Is there some person in that department that supervises the work generally?

Same objection.

A. There are a number of traveling auditors and they report to the general auditor.

Q. Who is the general auditor?

Same objection.

A. Mr. R. C. James.

Q. Do you know the name of the auditor that has been visiting the Des Moines Gas plant in recent years?

Same objection.

A. Well I think the same auditor never makes two consecutive visits to the same company. They are changed every time I think.

Q. Do you know the name of the man who was here last?

Same objection.

A. I do not.

Q. The one that was here in 1910?

Same objection.

2832 A. I do not.

Q. Did you bring in the minute books of the stockholders and directors in the Des Moines Gas Company?

Same objection.

A. They are here, yes.

Q. I wish you would—I think that book has been identified once before by Mr. Haines, I am not sure that is the one.

A. T-is is marked Des Moines Gas Company No. 1 stockholders and directors minutes.

Q. I wish you would turn to the record if there is any such in that book that was made at the time these salaries I have been inquiring about were provided for?

A. Yes, I have it.

Q. Is this all the record that was made upon that question of salaries, I am reading from page 185 in the book you have just turned to "Salaries officers, approved payment of salaries to the following officers at the following rates per year *a*ffective November 1, 1909, president $2,500, second vice president $1,800 treasurer $1,600 Secretary $1,600, purchasing agent $2,500. Is that all the record that was made with respect to these matters?

Same objection.

A. Does anything follow it on the page you are reading under the same heading?

Q. The next heading is betterment statement.

A. Then that is all the record which was made.

Q. Is this all the record that was made anywhere in any book?

Same objection.

A. Yes, sir.

Q. Do you know who proposed this list of salaries, how it got in here or why you have written it?

Same objection.

2833 A. Will you look at the beginning of the minutes of that meeting and tell me who was present?

Q. It says present President Bodine and directors Lilley and Thompson constituting a quorum.

A. You want me to give my recollection of how the whole matter of these salaries originated, my recollection outside of the record.

Q. Well the record don't show anything about it as far as you have it.

Same objection.

A. The record shows they were authorizes.

Q. If you have any recollection about it I would like to have it?

Same objection.

A. I recall that the matter was discussed by, first, I think by Mr. Lilley and myself and in view of the fact that the whole organization of the United Gas Improvement Company including its engineering department have been for a number of years rendering services to the Des Moines Gas Company we thought it was proper that some compensation should be made for these services after that time especially as the company had then reached a point where it was more able to pay properly for these services than it had been in the past. We considered that a total of about $10,000 a year was a proper sum to pay, for the Des Moines Gas Company to pay for all of the services of the whole U. G. I. organization and we thought that a proper way to pay it would be for the Des Moines company to appropriate salaries to those of the U. G. I. Officials who were its officers. I think Mr. Lilley and I worked out the different amounts per annum specific there making up the total of $10,000 then we talked it over with Mr. Bodine and Mr. Clarke and they agreed to it, then at the time for the next regular meeting of the board it was put before the board as appears by the record
2834 and approvee, authorized.

Q. Were you present at the meeting?

Same objection.

A. It appears by the record I was not.

Q. What you have been telling *you* then was something which occurred prior to the meeting?

Same objection.

A. Yes, sir.

Q. Not at the meeting?

Same objection.

A. Not at the meeting.

Q. All worked out before the meeting?

Same objection.

A. Yes, sir.

Q. When was it that it was first talked about?

Same objection.

A. My recollection is it was first talked about as much as three years before it was finally done.

Q. Well when was it first talked about with respect to—I don't mean at some years prior, but how long before this meeting had you talked about it and worked it out so it was ready to be approved by the board?

Same objection.

A. Well my recollection is that Mr. Lilley and I had talked about it as I say for at least three years before the date of that meeting and we have talked about the sum of $10,000 as being a proper amount. When we got down to the detail of splitting the $10,000 up into the several sums mentioned there I could not tell you.

Q. Well it didn't make any difference about that did it?

Same objection.

A. Oh no.

2835 Q. Since you didn't get any part of it?

Same objection.

A. Oh no, didn't make any difference about that.

Q. Been just the same if you had allowed it all to one officer as to divide it up among other officers?

Same objection.

A. So far as the final result to the United Gas was concerned, yes.

Q. Now going back to that question of just how the Des Moines Gas Company carries on its business, taking up that same question that I put to you before dinner of the purchase of a new generator. If I understood you correctly the request for the generator would be forwarded to the company, the U. G. I., at Philadelphia by Mr. Haines?

Same objection.

A. Technically the correspondence would be between Mr. Haines as manager which he was up to early this month of the Des Moines Gas Company and Mr. Clark as second vice president of the Des Moines Gas Company. They would correspond about *wht* wisdom and appropriateness or necessity of additional apparatus, probably the correspondence would originate with Mr. Haines.

Q. You don't mean probably it would originate with him, you mean don't you that if it came from here at all it would come from him.

Same objection.

A. Yes, but the probabilities are that he would originate the matter himself. He knows what the requirements of the plant are. He knows what the future is likely to be and as a general rule all correspondence relating to betterment expenditures would originate in Des Moines.

Q. Well now then after the matter had reached Philadel-
2836 phia and was received there by somebody on behalf of the United Gas Improvement Company what would be the next step taken with respect to that generator?

Same objection and also because the uestion assumes that this correspondence is received on behalf of the U. G. I. Company when it reaches Philadelphia.

A. The correspondence which would be addressed to Mr. Clark as an officer of the Des Moines Gas Company would be by him referred to some one or more of the members of the United Gas Improvement Company's engineering department for their consideration and their report thereon to Mr. Clark.

Q. Then what would Mr. Clarke do with it?

Same objection.

A. If Mr. Clark after receiving the reports mentioned thought the expenditure wise and judicious he would then take some early opportunity to lay it before the board of directors.

Q. And that would be at a regular monthly meeting of the board?

Same objection.

A. Yes, sir.

Q. And what action would then be taken?

Same objection.

A. Well that would depend upon whether the board agreed with Mr. Clark or not. If they agree with him they would authorize the expenditure and a record would be made of it.

Q. And if they did not authorize if then what?

Same objections.

A. Then it would not be authorized.

Q. Well would any record be made of that?

Same objection.

A. No.

2837 Q. Would not appear on the record at all?

Same objection.

A. Would not appear on the minutes, no.

Q. So that the minutes will only show the actual authorization of expenditures?

Same objection.

A. Yes, and I may say that in general the minutes will show only affirmative action, not negative action.

Q. Now in the case we are talking about, the generator, if the board of directors approve the expenditure then what is done?

Same objection.

A. Then the generator is built and paid for.

Q. Is that all there is to it, how does Mr. Haines find out what has been done?

Same objection.

A. Well Mr. Clark or some one for him would notify Mr. Haines.
Q. In what way?

Same objection.

A. Probably by letter.
Q. And do you have any special blank that you use in this case?

Same objection.

A. Yes, I think Mr. Clark has a blank that he uses in that case.
Q. That blank is fillee up either by him or somebody in the office there for him?

Same objection.

A. Yes, sir.
Q. And forwarded here to the Des Moines office? Is that right?

Same objection.

A. I would say so yes.

Q. And the Des Moines office then proceeds upon the au-
2838 thority that is covered by that blank filee out.

Same objection.

A. Yes, sir.
Q. Now can you give us some piece of apparatus or important part of this machinery down here that has been purchasee in the last three or four years?

Same objection.

A. Let me have the book and I can no doubt pick out some.
Q. Find the most important piece that has been authorized recently within say a year and a half or two years?

Same objection.

A. Shall I commence that for example the beginning of 1909, that would be about a year and a half.
Q. Yes, begin at that time if you wish to.
A. You said a year and a half and that occurred to me as about that. In the period commencing January 1, 1909, the largest single item I find is one of $12,000.
Q. What was that for?

Same objection.

A. That was for installing derrick coke tank and so forth which was approved at the meeting of April 25, 1910. Then I find at the meeting of January 24, 1910, an item of $10,000.
Q. What is that for?

Same objection.

A. Erect one 300,000 gallon oil tank in brick pit including steam oil connections, etc.

Q. Right at that point, that item you have just read, I wish you would produce for me or have some one for the company produce the correspondence that passes between the U. G. I. Company and the Des Moines Gas Company with respect to that item and
2839 the authorization that was *g*inally sent here, that was forwarded from the United Gas Improvement Company to the Des Moines Gas Company. Now I wish you would find for me in that year and a half if you *a* can without too much trouble the gas pipe, gas mains in considerable *w*uantities that were disposed of in the same way?

Same objection.

A. At the meeting of May 23, 1910, there is a list of twenty seven different runs of mains amounting in the aggregate to an estimated cost of $12,305.45.

Q. What is the date of that meeting?

Same objection.

A. May 23, 1910.

Q. I want you to produce the correspondence that passed between Mr. Haines, manager of the Des Moines Gas Co., and the United Gas Improvement Company or any of its officers covering that pipe you have just referred to and the authorization, if any.

Same objection.

A. There will be no such correspondence.

Q. Why not?

Same objection.

A. Because the correspondence will not be either with United Gas Improvement Company or with anyone who is not an officer of the Des Moines Gas Co.

Q. Well is that exactly correct?

Same objection.

A. I think so.

Q. I just wondered if you were sure about it?

Same objection.

A. Reasonably so.

Q. Do you remember just how the correspondence from
2840 the Philadelphia end is signed?

Same objection.

A. Oh not exactly no.

Q. Do you still think you are correct?

Same objection.

A. I think so, yes.

Q. Then let's put it the way that suits you best, the correspondence between Mr. Haines or anyone else for the Des Moines Gas Com-

pany and Mr. Clarke or Mr. Bodine or Mr. Lilley or yourself with respect to that item that you have just referred to in the record book?

A. The 27 items?

Q. Yes, 27 items and the authorization or authorizations as the case may be that were sent here covering that list of items. Are there any other items there?

Same objection.

A. Directors' meeting June 27, 1910, twenty one runs of main.

Q. Does it show what kind of main this is?

A. Four inch, six inch, four inch, eight inch, four inch, four inch, four inch, four inch, four inch, eight inch, four inch, four inch, four inch, six inch eight inch, four inch, four inch. Twenty one runs of main estimated to cost in the aggregate $5,756.66.

Q. What page is that please?

A. Directors' meeting June 27, 1910.

Q. Where was the meeting held?

Same objection.

A. Philadelphia.

Q. Are the stockholders' and directors' meetings all held in Philadelphia?

Same objection.

2841 A. No.

Q. When have the directors had a meeting in Des Moines?

Same objection.

A. You said stockholders' and directors' meeting.

Q. I am not talking about directors.

Same objection.

A. Oh I think all directors' meetings are held in Philadelphia, but not stockholders'.

Q. When have the stockholders had a meeting in Des Moines and who was present?

Same objection.

A. The last meeting was April 4, 1911.

Q. Who was present?

Same objection.

A. Mr. R. W. Cunningham and Mr. Haines.

Q. Who is Mr. R. W. Cunningham?

Same objection.

Q. He is one of the men in the office upon Seventh street.

Q. An office boy?

Same objection.

A. Oh no.

Q. Is Mr. Haines a stockholder?

Same objection.

A. No I think not.
Q. Is Mr. Cunningham a stockholder?

Same objection.

A. I think not.
Q. What is Mr. Cunningham's business?

Same objection.

A. Why he is one of the principal men in the office up there.
2842 Q. What does he do?

Same objection.

A. Receives customers, attends to their wants, and receives orders of all kinds.
Q. Who does he work for?

Same objection.

A. Des Moines Gas Company.
Q. Is he one of their bookkeepers?

Same objection.

A. If I recollect correctly Mr. Cunningham is not a bookkeeper I think he has charge of the floor in front of the office.
Q. Just one of the salaried men in the office isn't he?

Same objection.

A. Yes, sir.
Q. About $75.00 a month?

Same objection.

A. I don't know and I would not tell you if I did.
Q. Perhaps he would if we would ask him.

Same objection.

A. He might.
Q. Who is the head bookkeeper if there is any such man for the Des Moines Gas Co.?

Same objection.

A. Mr. Sherman is chief clerk.
Q. If we should want some man from the gas company for which you are secretary who could identify the entries in the books of the Des Moines Gas Co., who would we call upon?
A. I think Mr. Sherman would be the man.
Q. What is his first name?

Same objection.

A. I don't know.
2843 Q. Is he now working for the gas company?

Same objection.

A. Yes, sir.
Q. And you don't know his first name?

Same objection.

A. No.
Q. Do you know his initials?

Same objection.

A. No.
Q. How long has he been with the company?

Same objection.

A. I think he has been there twenty years.
Q. And he would know about the entry in the books would he?
A. Yes, sir.
Q. Now this stockholders' annual meeting here that you have referred to appears on page 239 of this book Des Moines Gas Company No. 1 stockholders' and directors' meetings, was held at that time was it?

Same objection.

A. I assume that the record is true.
Q. Well who made the record?

Same objection.

A. Tell we who signed it and I will——
Q. Were you present?

Same objection.

A. No, I was not there.
Q. You was not here at all?

Same objection.

A. No, I was not here.
Q. That is a meeting you did not attend as secretary?

Same objection.

2844 A. Yes, sir.
Q. Did you attend the stockholders' meetings in Des Moines?

Same objection.

A. No, I don't recall I ever attended one of them.
Q. Can you give us the date of a single meeting that has been held in Des Moines since 1906 when a stockholder was here personally?

Same objection.

A. No.
Q. Can you give us the date of a single meeting when you were here personally yourself?

Same objection.

A. No.

Q. Now where else in this book will I find a record of the stockholders' meetings?

Same objection.

A. Let me have it and I will point it out to you. On page 1, you will find a meeting of the incorpo-ators and stock holders commencing on page 1, the date of which was March 1, 1906. On page 91 the minutes of the annual stockholders' meeting held April 2, 1907. Page 129 annual stock holders' meeting held April 7, 1908. Page 166 annual stock holders' meeting April 6, 1909. Page 204, annual stockholders' meeting April 5, 1910.

Q. And the other one was the meeting for 1911?

A. Yes, sir.

Q. And the pages that you have just referree to start with the beginning of the book and end with the last page of this book do they not?

Same objection.

A. Start with page 1 but do not end——

Q. The last page upon which there is an entry?

2845 Same objection.

A. No, I think there are some entries subsequent to the stockholder's meeting of 1911. Perhaps I am wrong about that. The stockholders' meeting of 1911 is recorded on pages 239 and 240 and there appears to be nothing later than that, but here are the minutes of the later meeting which have not yet been recorded in the book.

Q. I will get those later on, I am getting at what is in this book.

A. I have here directors' meeting April 24, 1911, May 27, 1911, June 26, 1911, July 24, 1911, but they have not been entered in the book yet.

Q. These are not stockholders' meetings?

Same objection.

A. No, these are all directors' meetings.

Q. I am talking about stockholders' meetings.

Same objection.

A. Been no stockholders' meetings since the meeting of April 14, 1911.

Q. Now the first meeting that you refer to is on page 1 of the book just identified and that was held March 1, 1906.

Same objection.

A. That is my recollection, you have the book before you.

Q. At the stockholders meeting held on the 2d day of April, 1907, there were no stockholders present were there?

Same objection.

A. You have the record before you.

Q. Nobody present but Mr. Haines and Mr. Keffer was there.

Same objection.

A. It appears that all of the stockholders of record were present by proxy.

Q. I am talking about stockholders that were present in person.

2846 Same objection.

A. No, there appear to have been none present in person, they all sent in their proxies.

Q. And the meeting was held by Mr. Haines and Mr. Keffer.

Same objection.

A. Yes, sir.

Q. And who was Mr. Keffer?

Same objection.

A. Mr. Keffer was at that time and still is I think, I know assistant secretary of the Des Moines Gas Co.

Q. He is not an officer in any way of the U. G. I.?

Same objection.

A. No.

Q. But he was assistant secretary of the Des Moines Gas Co.?

Same objection.

A. Yes, sir.

Q. Now as to all these other stockholders' meetings the same thing is true, there were no stockholders present in person were there

Same objection.

A. It appears by the record of the annual stockholders' meeting April 7, 1908, which is recordee on pages 129 and 130 that all of the stockholders were present by proxy but none in person.

Q. How about the next meeting held, were any of them here in person.

Same objection.

A. At the opening there were conducting that meeting, Mr. Jansen Haines callee the meeting to order and on motion was chosen chairman of the meeting. Mr. Free P. Carr was chosen secretary of the meeting.

Q. *Were* there were no stockholders present any way?

Same objection.

2847 A. They were all present by proxy.

Q. I mean in person.

Same objection.

A. Not personally, no.

Q. 166 is the next page.

A. 166 stockholders' annual meting held April 6, 1909, it appears that all stockholders were present by proxy but none present in person.

Q. Who conducted the meeting?

Same objection.

A. I read from the record, Mr. Jansen Haines called the meeting to order and on motion was chosen chairman of the meeting. Mr. Fred P. Carr was chosen secretary of the meeting.

Q. I suppose Mr. Carr was attorney for some of the stockholders and Mr. Jansen Haines was an employé of the company?

Same objection.

A. Mr. Carr I believe is Judge Carr's son and a member of his firm and the firm are attorneys for the Des Moines Gas Company.

Q. Mr. Haines was an employé of the company?

Same objection.

A. Yes, sir. And Mr. Carr was a member of the firm who are attorneys for the company.

Q. Now how is it with Mr. Keffer, was he a stockholder?

Same objection.

A. No he is not a stockholder.

Q. Never was?

Same objection.

A. Not to my knowledge.

Q. Now the next meeting.

Same objection.

2848 A. Page 204 annual stockholders' meeting April 5, 1910.

Q. Any of the stockholders present in person?

Same objection.

A. Yes, sir.

Q. Who was present in person?

Same objection.

A. George H. Carr.

Q. Anybody else?

Same objection.

A. No all the rest present by proxy.

Q. Now the next one.

Same objection.

A. Page 239 annual stockholders' meeting April 4, 1911.

Q. Now as to all of these meetings the business of the meeting with the exception of one where you say a stockholder was present in person and the meeting of March 1906 was conducted by employés of the company here in Des Moines?

Same objection.

A. Or attorneys, yes.

Q. Now I wish you would turn to the record if there is any such in that book covering the approval of the purchase of holder No. 20 I think it is.

Same objection.

A. I don't think I know which holder that is.
Q. It is the large one. You have it?
A. No, I don't find any such record.
Q. Now within the last five years say, what part of this apparatus down here has been authorized by the stockholders or directors, the important part as shown by your book you have before you.

Same objection.

2849 A. The authorizations in the period you mention are principally for extensions of mains. I did not find any very large pieces of apparatus in that time.
Q. Did you find anything said about holder No. 20.

Same objection.

A. No.
Q. I wish you would take the other book, Capital City Gas Light Co. minute book and turn to 1901 and 1902 and see if you can find holder No. 20 in there or anywhere since that date?

Same objection.

A. No I don't find anything in the minute book of the capital city gas light company minute book No. 2. I commenced with meeting of January 16, 1901 and ran through to the last meeting in the book which is February 28, 1906.
Q. You found no record of it there?

Same objection.

A. No.
Q. And none in the record book since 1906?
A. No.
Q. Now take up another matter a moment, at what meeting was Mr. Haines elected president of this company?

Same objection.

A. At the meeting held early in July the minutes of which I have in my room at the hotel but they have not been recordee yet. I don't remember the exact date, it was early in July, quite early in July.
Q. Where was the meeting held?

Same objection.

A. Philadelphia.
Q. And why was the change made?

Same objection.

2850 A. Because the directors thought that Mr. Haines' management of the property, his good work in the city of which

by the way Dr. Marks has spoken, merited promotion.

Q. Have you given us the real and only reason?

Same objection.

A. Yes, sir.

Q. And what was done about the salary?

Same objection.

A. Action was had at that meeting making Mr. Haines' salary as president the same as his salary as manager had been.

Q. That -s there was no change in the salary?

Same objection.

A. No change in the salary.

Q. How about this salary that was voted to Bodine, does that go on just the same?

Same objection.

A. He was made I think 1st vice president and the salary which he had heretofore received as president was continued to his office as first vice president.

Q. Moved him down a notch or two but left his salary at the same point?

Same objection.

A. Yes, sir.

Q. Was it about the time these several salaries were voted that there was a general raise in the salaries up at the office, was that all done about the same time?

A. That was November 1909 wasn't it?

Q. The memorandum I have here is commencing November 1, 1909, I don't have the memorandum as to the date of the meeting.

A. That was at the meeting of October 20, 1909.

2851 Q. That was about a month preceding the time when these salaries were voted to the Philadelphia gentlemen?

Same objection.

A. No, you misunderstood me. The salaries to which you have reference were authorized at the meeting of October 20, 1909, the salaries became effective November 1, 1909.

Q. It was then at the same time that you had this matter up generally as to all these salaries that the raise was made up in the office.

Same objection.

A. No. That was acted on as I said at the meeting October 20, 1909 and what I suppose you refer to as a general raise in the office salaries was acted on at the meeting of February 28, 1910, and that was retroactive and the increase went into effect as of January 1, 1910.

Q. What do you mean — retroactive, that is you decided they ought to have had this raise sooner?

Same objection.

A. Well I will read you the minute- from the meeting of February 28, 1910. Approves increase in salaries amounting to $3,340 per year effective January 1, 1910, as follows: Then follows a list of the names, occupation, and the old rate per month and the new rate per month, total amount of $3,340 per year.

Q. So as a matter of fact beginning about January 1, 1910, the total increase in the salary list up here of the Des Moines Gas Company was upwards of $13,000?

Same objection.

A. Yes, $13,040.

Q. And you say that the company was actuated in its liberality in that direction by the fact that the gas company here at

2852 Des Moines was getting prosperous and could afford it.

Same objection.

A. Oh no I didn't say that.

Q. Well, what did you say about that?

Same objection.

A. In its liberality in increasing these salaries in an amount or total of $3,340 a year?

Q. No, all of it, $13,340?

Same objection.

A. With respect to the total of $10,000 a year I think I did say that the services of the United Gas Company's organization had been given for a great many years without compensation, and that it was thought that the company had at that ti-e reachee a point where it could afford to pay an appropriate compensation for these services. With respect to this increase amounting to $3,340 a year which was distributed between fourteen different employés I said no such thing but I would say however, that these increases were give- because merited by the services that the employés had rendered.

Q. What per cent was the increase of the particular salaries that are covered in that $3,300.

Same objection.

A. If I have calculatee it correctly a shade over 12 per cent.

Q. How much.

A. A little over 12 per cent.

Q. Now without going into the particular salaries what was the total salary list of the Des Moines Gas Co. before these raises and before this $10,000?

A. I can't tell you.

Q. You must have had it there ti figure that per cent.

2853 Same objection.

A. This is not the total salary list this is the salary of the 14 employés.

Q. I am talking about salary and not wages, men that were drawing salary and whose pay was increased?

Same objection.

A. Well there were other- whose pay was not increased at this time, this is not the full salary list.

Q. What was the total of the list there before the increased were made?

Same objection.

A. As I made it, the total in this list was $1,446.67 a month and it was increased by this action to $1,725 a month.

Q. Do you know what the tota- salary list of the office was, I don't mean boys that you would call working for wages, but the salary list as distinguished from the wage list?

Same objection.

A. I do not.

COURT: Does that include the parties that the $10,000 was voted to?

A. No, sir.

COURT: Just employés of the company?

A. Officers and employés of the company other than the parties to whom the $10,000 was voted.

Q. Just give us, not the names of the persons, but the title?

Same objection.

A. Manager, commercial agent, head salesman, five salesmen, demonstrator, saleswoman, two clerks in the new business department cadet engineer and night fireman.

Q. When you say two clerks does that mean two additional clerks or does it mean the salary of two clerks was increasee?

Same objection.

2854 A. Means salary of two clerks was increased, one was increased from $35 to $45 a month and the other from $25 to $335 per month, an increase of $10 a month in each case.

Q. You mean the $3,000 and a fraction that you give me there represents increases altogether and no new salaries, that is I mean no new independent salaries.

Same objection.

A. Yes, all increases.

Q. Now was the force increased largely about that time?

Same objection.

A. I don't know, it does not appear from this record that it was.

Q. Do you know independently of the record that it was or was not?

A. I beg your pardon, I see on the minutes of this same meeting on the same page that they authorized the employment of two additional solicitors and one special lighting man.

Q. How many solicitors had they just prior to that?

Same objection.

A. I don't know.

Q. Could you find out right away from the record there?

Same objection.

A. No, I think not.

Q. Now these solicitors, what is their business?

Same objection.

A. Briefly expressed they canvass for new business, they go out on the streets and go from house to house trying to interest the people in gas for cooking or if people are not using gas for lighting they try to interest them in that or if they find a house where gas is not being used for any purpose they try to interest the householder in the use of gas for as many purposes as they can. In general they are soliciting new business and endeavoring
2855 to retain old business as against the competition of other forms of lighting and other fuels.

Q. On this page or in this minute book beginning on page 199 are found here if I understand your testimony so far correctly the minutes of the directors' meetings held in Philadelphia on the 28th day of February 1910 and at which Mr. Lewis Lilley acted as secretary, is that right?

Same objection.

A. You have the book before you general, I can't see it from here.

Q. I wondered if you had noticed the record sufficiently so you could state that?

Same objection.

A. No.

Q. Were you present at that meeting do you remember?

Same objection.

A. Will you tell me from the record whether it appears I was there.

Q. Your name is not in the list of those present?

A. Then I was not there

Q. It says vice president Clark and directors Lilley and Thompson.

A. Then I was not there.

Q. Were the salaries of all these people to date from January first or only these increases?

Same objection.

A. Will you please read me what the record says?

Q. It says approved increases of salaries amounting to $3,340 per year effective January 1, 1910, as follows; and then follows the parties.

Same objection.

A. That means that the increases were to date from January 1, 1910.

Q. But does not apply to any of these other persons that were authorized at that time as additional employés?

2856 Same objection.

A. Oh no.

Q. Now I notice it says here two additional solicitors $75 each and one special lighting man $100 and then follows $3,000. Does that mean the total salaries for the three persons is $3,000?

Same objection.

A. If you let me see it I will answer you. Yes, that means that the total salary for the three persons is $3,000 a year.

Q. Now these additional employés, the additional solicitors and this additional or this special lighting man were they authorized because of the increases and drawing business of the company?

Same objection.

A. No, I should say they were authorized to try to increase the business.

Q. That was the porpose of it rather than to meet any depressing demand for them at the time, is that right?

Same objection.

A. These solicitors and special lighting man are employed as employés who seek to increase the business.

Q. What does the special lighting man do, what is his business.

Same objection.

A. He is much the same as a solicitor only he is rather a higher class man and he would occupy himself pretty largely with what we call commercial lighting as distinguished from domestic lighting. That is store lighting, he would canvas- among the business houses and try to get them to use gas in arc lamps or inverted incandescence for lighting their places of business, try to persuade them it was better or cheaper than electricity so it required rather a high class man to do that, higher than a man who did house to house canvassing in the residence parts of the city.

2857 Q. You dropped a remark once or twice in your answers in explaining this new salary list that the United Gas Improvement Co. had never had any compensation for services rendered to the Des Moines Gas Company. Is that exactly correct?

Same objection.

A. Well speaking in the large it is. There may have been some —in fact I noticed in reading the minute book of the old Capital City Gas Light Company that there was a payment made back in 1901 or 1902 I think. It appears to have been a payment in part for money advanced and in part for services. But since the organization of the Des Moines Gas Company there have been no compensation of any kind for the services of the organization.

Q. Perhaps I don't know just what you mean by the term in the large. Do you know just how the United Gas Improvement Company got the sto-k of the Des Moines Gas Company?

Same objection.

A. Yes sir.

Q. Didn't pay anything for it did it?

Same objection.

A. It is difficult or would perhaps be impossible to fix a price per share.

Q. I am not asking you that. Didn't pay anything for it, any of it by share or any other way.

Same objection.

A. Oh yes.

Q. What did it pay for it?

Same objection.

A. When the Des Moines Gas Company was organized as appears by the minute book it issued practically its entire capital stock and certain other securities for the property and assets of the Capital City Gas Light Company and for certain other properties and
2858 assets all of which had cost their owners considerable sums.

Q. What owners?

Same objection.

A. Well the property and assets of the Capital City Gas Light Company were owned by that company and a large majority of that stock was owned by the United Gas Improvement Company.

Q. Yes, all of it wasn't it?

Same objection.

A. It appears by the minutes of the last meeting of the Capital City Gas Light Company that the stockholders were Samuel T. Bodine, George Fuller, Trustee, W. A. McEwen, Louis Lilley, A. B. Cummins, Jansen Haines, and W. B. Keffer.

Q. These men didn't own any stock did they?

Same objection.

A. I think substantially all of it was owned by the United Gas Improvement Company.

Q. And the truth is isn't it that the United Gas Improvement Company acquired the ownership of the 22,500 shares of stock of the so-called Des Moines Gas Company without paying one single dollar for it.

Same objection.

A. No, I would not say that was true.

Q. Will you tell me where they paid one cent or where the Master or counsel can find the record of their having given a single dollar in money for that stock?

Same objection.

A. The United Gas Improvement Company owned a very large majority of the stock of the Capital City Gas Light Company and when the Capital City Gas Light Company distributed the proceeds of the sale of this property after it had sold out to the Des
2859 Moines Gas company this stock with other securities came into the possession of the United Gas Improvement Company as its distributive share of the proceeds of the sale by the Capital City Gas Light Company so that whatever investment the United Gas Improvement Company might have theretofore had or did theretofore have in the securities of the Capital City Gas Light Company was converted into stock and other securities of the Des Moines Gas Company.

Q. Yes, but they didn't have any.

Same objection.

A. Oh yes.

Q. Isn't this what they did when that reorganization took place, every dollar of the value of the property that was represented by the assets of the Capital City Gas Light Company was covered by preferred stock of some $800,000, I have forgotten exactly the amount and by some bonds or securities amounting to $300,000 or more and the 22,500 shares of stock were simply issued by the Des Moines Gas Company and turned over to the United Gas Improvement Company which owned the Capital City Gas Light Company and was distributed in the form of dividends to the United Gas Improvement Company.

Same objection.

A. No, I would not say that was so.

Q. Do you say it is not so?

Same objection.

A. Yes, sir.

Q. At the time the transfer was made was there a single dollar of real money put into the transaction?

Same objection.

A. There was——

2860 Q. You can answer that question yes or no can't you?

Same objection.

A. Yes, I can answer it yes or no.

Q. Will you do that please?

Same objection.

A. You mean cash?

Q. I mean cash, yes.

Same objection.

A. No.

Q. Now Mr. Douthirt the Capital City Gas Light Company was capitalized for how much?

Same objection.

A. My recollection is it was 600,000 and 400,000 bonds.

Q. And what was the amount of preferred stock that was issued by the Des Moines Gas Company to take care of the obligations of the Capital City Gas Light Company that represented the money that had gone into it?

Same objection.

A. I can't answer that question for two reasons.

Q. Can you turn to the book there and see?

Same objection.

A. No.

Q. Why not?

Same objection.

A. Well because one reason is you put on to the end of your question the expression "That represented the money that had gone into it.

Q. What is wrong with that, did it represent more than the money?

Same objection.

A. It assumes a certain amount of money as having gone
2861 into the Capital City Gas Light Company.

Q. Well what is the matter with the assumption, isn't it sound?

A. I don't think so.

Q. Well if that is your trouble we will leave off that assumption and you then tell us what was the amount of the preferred stock that was issued and used in this reorganization, where it went to and what the money was used for?

Same objection.

A. If I answer your question categorically it would lead to a misapprehension.

Q. Well I don't want anything of that kind to happen.

A. Well with that as a preliminary I will say there was no preferred stock issued.

Q. Was there any authorized?

Same objection.

A. No.

Q. None at all?

Same objection.

A. No.

Q. And none has been since?

Same objection.

A. No.

Q. Well was there any other stock except the 22,500 shares issued

Same objection.

A. No. Now you are leading to the misapprehension which I fearee would follow.

Q. I think I know wher- you think the trouble is. If you have any e-planation to make to that transaction which the question does now permit you to make, you may make it in your own way.

Same objection.

2862 A. The securities which you refer to as preferred stock and which amounted to $800,000 is not preferred stock. That is the misapprehension I feared might come up.

Q. I don't understand the high finance of it and do not understand the right term. You use such terms as you want to and tell us about it.

Same objection.

A. There was $800,000 face value issued in what for want of a better name was denominated preferred stock contracts.

Q. Then my trouble was in not adding to the preferred stock the contract part of it. Now there is not a bit of difference between preferred stock contracts and preferred stock as the terms are used generally among business men is there?

Same objection.

A. Yes, I think there is.

Q. There is a contract in both instances is there not?

Same objection.

A. I think there is a decided difference.

Q. Well we won't quarrel about that. There was $800,000 of these preferred stock contracts issued, that is right is it?

Same objection.

A. That is right.

Q. What became of that?

Same objection.

A. That followed the same course as the 22,500 shares of stock.

Q. Who got it?

Same objection.

A. United Gas Improvement Company.

Q. And what rate of interest did it draw?

Same objection.

A. Six per cent.

2863 Q. Have you one of these stock contracts handy?

Same objection.

A. Yes, sir.

Q. I wish you would have one of them with the other papers I am going to ask you for as we go along?

A. If you will give me the minute book I will show you one.

Q. One in the minute book?

Same objection.

A. Yes, sir. May I read it to the reporter so it may appear in the record.

Q. I would be glad to *here* one of these things read, I have not read it yet.

Same objection.

Des Moines Gas Company.

This contract will entitle —— —— to — shares of the par value of $100 each of preferred capital stock of the Des Moines Gas Company, a corporation organized under the laws of the state of Iowa for which certificates in due form will be issued (upon surrender of this contract) whenever the company shall be authorized by law to issue such preferred stock and the holder hereof shall demand the same. And in the meantime the holder of this contract shall be entitled to all the benefits of a preferred stockholder except the right to vote and shall be paid interest at the rate of six per cent per annum upon a sum equal to the face value of said shares from March 1, 1905, payable semi-annually on the dates and in the manner following, viz:

This contract is transferable only on the books of the company upon its surrender by the registered owner in person or by attorney at the office of the company. Said books will be closed and no transfers will be made thereon from the 1st to the 13th days, both inclusive, of September and March in each year. On the 15th day of each September interest for the half year ended the last day of August last preceding and on the 15th day of each March interest for the half year ended the last day of February last preceding will be paid to the registered owner.

The said preferred stock when issued will entitle the holder thereof to be paid dividends thereon at the rate of six per centum per annum from the date to which interest was last paid under this contract in preference or prior to any dividends to be paid to holders of any other class of stock of the company and this right to dividends shall be cumulative.

Said preferred stock when issued will also entitle the holder thereof in the event of any liquidation or winding up whether
2864 voluntary or involuntary of the assets and affairs of the company to be paid the par value of such preferred stock out of such assets of the proceeds thereof before any part of the same shall be distributed to the holders of stock of any other class.

Having previously given thirty days' notice in writing to the holder thereof by mailing same to his last post office address on its books the company may on any 15th day of September or any 15th day of March at its option relieve and discharge itself in whole or in part from the obligations of this contract upon paying to the holder hereof cash at the rate of $100 per share for the said preferred stock or such part thereof as the company may elect to which the holder hereof is under the conditions hereof entitled: Provided that when making any such payments the company shall treat the holders of all similar contracts then outstanding alike, that is to say the company shall also on the same date make payment of the

same relative sums to the holders of all such contracts then outstanding.

Nothing herein contained shall prevent the issue of further and additional contracts of similar import.

In witness whereof, etc.

Q. There is a term used there that I don't know that I understand it and I would be glad to have you enlighten me if you will, something about cumulative dividends, what does that mean?

Same objection.

A. Cumulative dividends is an expression quite ordinarily used in connection with expressing the rates or preference of any class of stock or other security that may have other stocks or securities junior to it and it means that if the dividend is not paid in any one year it may accumulate, that is, the company may have to pay it in some succeeding year before the company is free to declare or pay dividends on junior classes of securities. This preference of preferred stock, speaking generally may be either cumulative or non cumulative.

Q. Well in plain language it means don't it that if the
2865 dividend is not paid that then dividends on that dividend at the same rate that the share of stock draws shall be paid, isn't that what it means?

Same objection.

A. Not ordinarily, no.

Q. Isn't that what it means here?

Same objection.

A. No.

Q. I mean dividends on the unpaid dividend. For instance suppose there was a thousand dollars due and unpaid and it was carried over unpaid for a year, when your interest there for the next year would be payable it would be six per cent on the principal and six per cent on the deferred dividend wouldn't it?

Same objection.

A. No.

Q. Now isn't that exactly what it means?

Same objection.

A. No. I have known of securities of that class or rather securities possessed of characteristics you are describing, but cumulative dividends never carry interest in case they are unpaid unless it is so specified in the instrument under which the security is created.

Q. Well in this case here it would not be cumulative unless there was something to add to it would it?

Same objection.

A. Oh yes.

Q. In what way?

Same objection.

A. I can perhaps explain it best in this way, a non-cumulative preferred stock is one in which if the dividend is not earned
2866 and paid in a given year the stock is entitled to dividend for that year. A cumulative stock is one in which if the dividend is not earned and paid in a particular year the dividend itself but not any further interest or dividends on the dividend must be declared and paid before anything can be paid on a junior security.

Q. What I am trying to get at is just what the earning power of a certificate like that would be and if I understand you now it would simply be the six per cent that it provides for.

Same objection.

A. Yes, sir.

Q. And that cumulative does not mean anything except that the dividend if not paid when due must be paid at some later date.

Same objection.

A. Yes, before anything can be paid on any junior security.

Q. So that the share of stock that you just read would earn six per cent and no more?

Same objection.

A. The share of stock which might be issued under the contract which I have just read might earn six per cent and no more.

Q. Now there was $800,000 of that kind of stock issued.

Same objection.

A. That sort of contract. I don't want to quibble about the terms with you, general, but I don't think it is proper to call it stock.

Q. Well let's call it stock contract.

A. All right, I will agree with that.

Q. Turned over to the U. G. I.?

Same objection.

A. Ultimately reached there.

2867 Q. Oh well, ultimately, they were there to receive it?

Same objection.

A. Yes, sir.

Q. Now what sort of security or evidence of indebtedness was issued for the 300 and some thousand dollars in addition to that $800,000?

Same objection.

A. I think the most concise answer I can make to your question is to read you from the minutes exactly what was done.

Q. Well you can tell me without doing that can't you, or if you prefer to read it I don't care.

Same objection.

A. The record is the best evidence I think.

Q. Well sir it is very interesting to me, you can take time to read it if you wish.

Same objection.

A. There was an offer made——

Q. Now don't put anything in, you are reading what is there.

A. —.

PHILADELPHIA, *February* 26, 1906.

Des Moines Gas Company, Des Moines, Iowa.

GENTLEMEN: I am able to procure the conveyance to you of valuable real estate in the city of Des Moines, and in the town of Valley Junction, Polk county, Iowa, and I am also able to procure the conveyance and transfer to your company of the property assets, business and franchises of the Capital City Gas Light Company (except its franchise to be a corporation) as well as the property assets, business and franchise of Jansen Haines and William B. Keffer in the town of Valley Junction, Iowa. The output general business, and earning capacity of said plants are well known to your company. The present bonded indebtedness of the Capital City Gas Light Company consists of Four Hundred thousand dollars ($400,000) at par of first mortgage six per cent gold bonds secured by mortgage upon the property of the company to the Union Trust Company of New York as trustee which bonds are due January 1, 1907.

I hereby make the following proposition to you:

First. To procure the conveyance, sale and transfer to your company subject to existing contracts and free from all debts and liability except said Four Hundred Thousand dollars ($400,-
2868 000) at par of said first mortgage gold bonds, accrued interest thereon and current liabilities, of the entire plant property, real and personal, business, rights, privileges and franchises of the Capital City Gas Light Company, except its franchise to be a corporation.

Second. To procure a conveyance to your company of all these certain lots of ground situate in the city of Des Moines, Polk county, Iowa, and described as follows: Lots numbered three (3) and four (4) in Block K and Lots numbered nine (9) and ten (10) in Block M in Scott & Dean's Addition to the town of Fort Des Moines, now included in the corporate limits of the city of Des Moines.

Third. To procure a sale, conveyance and transfer to your company subject to existing contracts except a certain contract between Jansen Haines and William B. Keffer and George J. Roberts, dated May 1, 1905, for laying mains, etc., the payments under which I hereby agree to make and free from all debts and liability, the entire plant, property real and personal business, rights, privileges and franchises of Jansen Haines and William B. Keffer in the town of Valley Junction, Iowa, including the following real estate situated in said town, Lot numbered nine (9) in Block Fifteen (15) in the First Addition to Valley Junction.

The consideration to be paid by your company to be as follows:
(*a*) First mortgage five per cent twenty year gold coupon bonds of your company redeemable on any interest date at one hundred five (105) per centum and interest to the amount of Two Hundred and eighty five thousand Dollars ($285,000) at par being part of an issue of One Million Five Hundred Thousand Dollars ($1,500,000) at par of said bonds to be authorized by your company to be secured by mortgage upon the entire property and franchises of your company including all of the same acquired by your company under this proposition as well as that hereafter acquired. Of the remaining One million Two hundred and fifteen thousand dollars ($1,215,000) at par of said bonds, Four Hundred Thousand Dollars ($400,000) at par thereof shall be retained by the trustee uncertified until required to purchase or pay for or take up, exchange or replace, said first mortgage bonds of the Capital City Gas Light Company now outstanding and the balance thereof, to-wit, Eight Hundred and Fifteen Thousand Dollars ($815,000) at par shall be retained by the trustee uncertified and used by the company from time to time only for the purpose of making additions to or extensions or betterments of its plants and for acquiring other plants or property real or personal.

(*b*) Twenty two Thousand Four Hundred and ninety (22,490) shares of the par value of One Hundred Dollars ($100.00) out of the authorized issue of Twenty two thousand five hundred (22,500) shares of the capital stock of your company issued to me or upon my order fully paid and non-assessable.

(*c*) Preferred stock contracts of your company bearing
2869 interest at the rate of six per cent per annum to the total amount of Eight Hundred Thousand Dollars (800,000) at par, said contracts to be in the form herewith submitted.

Respectfully submitted,

W. H. MARSHALL.

Q. Now right at that point, who was W. H. Marshall in his palmy days?

Same objection.

A. If you will eliminate the palmy days——

Q. All right, cut that out.

A. Mr. Marshall is an officer of the United Gas Improvement Co.

Q. Mr. Marshal at that time was an employé of the United Gas Improvement Company?

Same objection.

A. Yes, sir.

Q. And he is yet.

Same objection.

A. Yes, sir.

Q. And his employment is not very important in its nature is it?

Same objection.

A. Well——

Q. He was an office boy at that time wasn't he?

Same objection.

A. Oh by no means.

Q. What was his work?

Same objection.

A. One of the principal accountants of the company

Q. Working for the company on a salary.

Same objection.

2870 A. Yes, sir.

Q. How much of a salary?

A. I don't know.

Q. About how much?

Same objection.

A. I don't know.

Q. Where is he now?

Same objection.

A. I think he is in Philadelphia, he was here last week.

Q. Still working for the U. G. I.?

Same objection.

A. Yes, sir.

Q. On a salary?

Same objection.

A. Yes, sir.

Q. This whole business was carried on in his name, the stock was actually issued to him wasn't it?

Same objection.

A. I don't recall as to that, the stock under the proposition was to be issued to him or upon his order, whether it was issued to him or whether he gave an order to issue it to somebody else, I don't recall.

Q. You know as a matter of fact *he* was actually issued to him and they carried the play to the extent of issuing it to Marshall?

Same objection.

A. I don't know, I can look here and see if there is anything here to indicate it. I would say you were right because — the minutes of the annual stockholders' meeting held April 2, 1907, it appears there were 22,490 shares in the name of W. H. Marshall.

Q. I was not only right, but so far as the books of the Des
2871 Moines gas company is concerned, he still owns it?

Same objection.

A. No, I think not. I think it stands in the name of the United Gas Improvement Company now.

Q. Where do you think that appears on the books of the Des Moines Gas Company?

Same objection.

A. By the minutes of the annual stockholders' meeting held April 6, 1909, which commences on page 166 it appears that the United Gas Improvement Company was the owner of 22,490 shares.

Q. In what way does it appear?

Same objection.

A. Here is a list of the stockholders present by proxy, it appears that Mr. Fred P. Carr held the proxies of Messrs. George H. Carr, Rollin Norris, Earl Thompson and myself. It appears Mr. Jansen Haines held proxies of Mr. Lewis Lilley, Samuel T. Bodine, Walton Clark, United Gas Improvement Company and Randolph Morgan and the number of shares standing in each of these names is specified.

Q. You were never a stockholder were you?

Same objection.

A. There was evidently a share standing in my name.

Q. You didn't even know that a little while ago did you?

Same objection.

A. Probably not.

Q. As a matter of fact you never owned a share in the company did you?

Same objection.

A. No, I never owned a share.

Q. That is true as to several of these names you just read
2872 isn't it?

Same objection.

A. Very likely. By the minutes of the annual stockholders' meeting held April 5, 1910, the record of which commences on page 204 it appears that the United Gas Improvement Company held 22,490 shares which were represented by Mr. Haines as proxy and voted by him.

Q. The name United Gas Improvement Company, don't appear there at all does it?

Same objection.

A. Yes, sir.

Q. On that page you have just read?

Same objection.

A. Yes, sir.

Q. As represented by these names you read?

Same objection.

A. No, the name United Gas Improvement Company appears right here.

Q. As the owner of this stock?

Same objection.

A. Yes, sir.

Q. Is there any other book in this company that shows that that you know of?

Same objection.

A. Yes, sir.
Q. What other book?
A. The stock certificate book and stock ledger show that.
Q. Where are they?

Same objection.

A. They are in Philadelphia I think.
Q. Either of them here?

Same objection.

2873 A. I think not, both in Philadelphia.
Q. What other books in Philadelphia that have in them accounts of the Des Moines Gas Co.?

Same objection and because of the use there of "other" and the assumption that this stock certificate book and stock ledger had accounts between the U. G. I. Company and the D. M. Gas Company.

A. That book would simply have an account on it showing the number of shares of record in each name.
Q. Now to get back to the question what other books or records are kept in Philadelphia that involve the business of the Des Moines Gas Company other than the stock books and other books you have just referred to.

Same objection.

A. My impression is that we have there a ledger which would be an exact duplicate of the ledgers in the office here.
Q. In other words you have in Philadelphia a set of books that involved the business of the Des Moines Gas Company, that is right isn't it?

Same objection.

A. Why yes, the journal entries are sent on from here every month one of the 26 things Mr. Haines tried to tell you about.
Q. Mr. Haines didn't try to tell me about any books in Philadelphia.

Same objection.

A. Perhaps Mr. Haines didn't know about them. Information is sent by Mr. Haines or his subordinates to Philadelphia from which it is possible to reproduce in Philadelphia the general ledger that is here.

Q. If I were to go to Philadelphia next week and want to
2874 take the deposition of the officers of the United Gas Improvement Company with respect to the business of the Des Moines Company they could produce the records and books there couldn't they to show just what was going on in Des Moines?

Same objection.

A. In a general way, yes.

Q. Now to get back to this interesting document and communication that you read from Mr. Marshall, I notice that he refers in there to some property at Valley Junction said to belong to Jansen Haines and W. B. Keffer. They didn't own any property in Valley Junction did they?

Same objection.

A. Only they had legal title of it, that was all.

Q. Well it belonged to the United Gas Improvement Company did it not?

Same objection.

A. The United Gas Improvement Company furnished the money to put in the distribution system out there.

Q. Not only furnished it, but it was done for them by their employes here in Des Moines was it not, purchased by them?

Mr. GUERNSEY: Who is them, the United Gas Improvement Company or Des Moines Gas Company?

(Question withdrawn.)

Q. Mr. Jansen Haines and Mr. W. B. Keffer were not in the gas business — Valley Junction on their own account were they?

A. No, they were simply conducting it there until such time as the Des Moines Gas Co. could be organized and issue securities and raise the money which was necessary to make the installation out there.

Q. They didn't get any $45,000 did they for their inter-
2875 est in that business?

Same objection.

A. Oh no.

Q. They didn't get anything did they?

Same objection.

A. No, they didn't get anything.

Q. The books indicate they did don't they?

Same objection.

A. Well the books indicate I suppose that something was paid to them as the holders of the legal title of property out there.

Q. But as a matter of fact there was not a dollar paid was there?

Same objection.

A. Oh I think so.

Q. To them?

Same objection.

A. To them or their order.

Q. Well where did it go to, that is what I want to know.

Same objection.

A. Oh of course it finally came back to the same old place.

Q. It finally didn't get anywhere did it, it never started, isn't that the truth of it? Take this $285,000 that you referred to there,

there was $45,000 in addition to that to cover the Valley Junction business.

Same objection.

Q. Well was the 45,000 included in the $285,000?
A. I don't know what 45,000 you are talking about.
Q. You ought to know, you were a stockholder and were represented at the meeting that disposed of it wasn't you, or did your proxy do that?

Same objection.

A. No, I was not even a nominal stockholder at that time.
2876 Q. What became of the $285,000 you refer to, — a record there how it was distributed?

Same objection.

A. That would appear in the record of—the record of the Des Moines Gas Company of course would show nothing about that distribution.
Q. I don't care which record you use.
A. You have got hold of the figure $45,000 that I don't understand.
Q. It will be clear before we get through with the examination I hope. What became of the 285,000, can you tell us?

Same objection.

A. The $285,000 to which you refer was in the form of bonds.
Q. I know, but how was it distributed, how were the bonds distributed, who got them.

Same objection.

A. It appears by the record of the director's meeting of the Capital City Gas Light Company held February 28, 1906, which commences on page 183 of Volume 2, that the Capital City Gas Light Company got $240,000 out of the $285,000 of bonds.
Q. Now where did the $45,000 go.

Same objection.

A. It does not appear by the record of either company, but my recollection is that that went to Messrs. Haines and Keffer for the Valley Junction property.
Q. That is it did on paper you mean?

Same objection.

A. Yes, sir.
Q. As a matter of fact they didn't get any part of these bonds did they?

Same objection.

A. Oh no.
2877 Q. They were never issued were they?

Same objection.

A. Oh yes, they were issued.
Q. They were actually issued?

Same objection.

A. Oh yes.
Q. And who got them, the parties that issued them?

Same objection.

A. No, they were issued by the Des Moines Gas Co.
Q. Well who got them?

Same objection.

A. They went in the first instance according to my best recollection to Haines and Keffer and from them to the United Gas Improvement Co.
Q. So that $45,000 now don't seem mysterious to you?

Same objection.

A. No, I see where it comes in now, the difference between 240 and 285.
Q. The $45,000 you think was distributed through Haines and Keffer and finally to the United Gas Improvement Company and what became of the $240,000?

Same objection.

A. May I say first with respect to the 45,000 that is simply my recollection, not a matter of record here.
Q. Is it a matter of record anywhere you know of?

Same objection.

A. I don't know, very likely is.
Q. If it is not there where would we find it. You are secretary of the company, maybe you can help us located —.

Same objection.

A. I think you would probably find it on some of the
2878 books in Philadelphia.
Q. How will we get that on some of the books in Philadelphia, do you know anyway we can get them here?
A. No, I think you will have to go there.
Q. Didn't you think it quite important to have them here?

Same objection.

A. Didn't occur to me so no.
Q. You know you were coming out here to try a very important law suit that involved your gas company or the gas company in which you are an employé or officer didn't you?
A. Yes, sir.
Q. And you are a practicing attorney aren't you?
A. No.
Q. I thought you said here this morning you we- a member of three bars.

Same objection.

A. I am.

Q. But you do not practice, is that what you mean?

Same objection.

A. That is what I mean, yes.

Q. You are a nonactive member?

A. Yes, you might put it that way.

Q. You say now you didn't think it was important to bring out the records that would open up this entire transaction so that everybody would understand it as well as you do?

Same objection.

A. No, I didn't think it was important.

Q. Well what part of the business of these concerns did you think ought to be suppressed and covered up.

Same objection.

A. None of it.

2879 Q. Well how did you expect the court or Master or anybody else to know whether your property the company property was taken without fair compensation unless the Master knew something about your property and how you got it, what was involved in it?

Same objection.

A. My thought was that was by proper testimony the Master would find the reasonable present value of the property which is devoted to the public use, which could be ascertained by proper testimony without any regard whatever to what securities are outstanding against that property and further, that the Master could find by proper testimony from the books which are here in Des Moines all about the operating expenses of the company and the net revenues and with full information before him with respect to these matters he would be able to determine.

Q. You have dictated in a sense have you not the plan of this entire trial, you have been in it from the beginning have you not, I mean the complainant's side of it?

Same objection.

A. I have helped all I could but I would not assume to say that I have dictated the plan of the entire trial.

Q. Is it not true Mr. Louthirt that from the very beginning you have been active and busy in the preparation of this law suit and in having it presented to the Master in the way it has been presented?

Same objection.

A. Yes, that is true.

Q. You commenced that work a long long time ago didn't you?

Same objection.

A. Yes; I commenced to be very actively interested in the situation as long ago as last November.

2880 Q. Yes, and longer ago than that didn't you?

Same objection.

A. No, because it didn't arise, there was nothing to indicate it before that time.

Q. Didn't you begin to get ready for this very law suit longer ago than the 1st of last November?

Same objection.

A. No.

Q. Didn't you begin to build up this method of fixing the values of the complainant's property longer ago than the 1st of last November?

Same objection.

A. No.

Q. When you left Philadelphia to come out here was it your thought that you could properly try and present this case to the court and to the Master without producing all of the books that involved all of the transactions of the Des Moines Gas Company.

Same objection.

A. I thought it would be proper to produce all of the books that involved all of the transaction- of the Des Moines Gas Company.

Q. Yes, now there are part of them in Philadelphia.

Same objection.

A. No. Well the stock ledger, yes, is in Philadelphia.

Q. That is all that is there is it?

Same objection.

A. All of the books that involves transactions of the Des Moines Gas Co.

Q. How about this $240,000, where is the book that shows what became of that, of the $240,000 of bonds?

Same objection.

A. Books of the Capital City Gas Light Co. show it I think.

2881 Q. Do they show it?

A. I think so.

Q. Is there a diplicate set of the Capital City Gas Light Company's books in Philadelphia?

Same objection.

A. I don't know whether a duplicate or not, the originals are in Des Moines.

Q. You say you don't know whether there is a duplicate set or not.

A. No, I do not.

Q. What is the name of the comptroller that is here at this trial?

A. You mean Mr. Curran?

Q. What is his business.

A. He is comptroller of the United Gas Improvement Company.

Q. As such what is his work?

Same objection.

A. He has general charge of all the accounts, general supervision I would rather say of the accounting of the various companies in which the United Gas Improvement Company is interested and he has also some to do with the detail*a* accounting of the United Gas Improvement Co.

Q. I want to say to you at this point that we want to use Mr. Curran before this case is closed as a witness so we expect him to be here. I find on page 201 of this Des Moines Gas Company stockholders' and directors' minutes No. 1, the following language: Sub-head, title Betterment system. The vice president submitted a statement prepared by the treasurer showing that the company had expended in making additions to or extensions or betterments of its plants or acquiring other plants or property real or personal from March 1, 1906 to December 21, 1909, the sum of $63,-
2882 567.07 and showing the various items comprising this sum which statement was read and ordere*e* spread upon the minutes and is as follows: Expenditures made for additions to extensions or betterments of plants of the Des Moines Gas Company or for acquiring other plants or property real or personal from March 1, 1906, to December 31 , 1909, real estate $438.61 extension and improvement of works, $59,045.26 street lamp extensions $2,039.65, street mains $192,479.34, meters $55,649.88; services $53,914.33; Total $363,567.07. Were you present at the meeting when that statement was presented?

Same objection.

A. Will you refer to the record and see if I was?

Q. The record is signed by Lewis Lilley and on page 201 it gives as present Vice president Clark, directors' Lilley and Thomson.

A. Then I was not there.

Q. Is that the only way you have of knowing you were not there?

Same objection.

A. Yes, sir. Well I could look at my diary and see whether I was in Philadelphia on that date.

Q. You knew that record existed didn't you?

Same objection.

A. Oh I suppose so, yes.

Q. Why was all this agitation here the other morning about letting us have this book, do you know?

Same objection.

A. No.

Q. Do you know why that record was not introduce*e* in evidence by the complainant?

Same objection.

A. No I don't know.

2883 Q. Can you think of any reason why it was not offered?

Same objection.

A. Yes, I can think of a reason.

Q. Why?

Same objection.

A. Well the figures which you have just read can be very easily checkee up and verified from the books right here in Des Moines and the city's accountants have been working on them since July.

Q. Was that the reason?

A. You asked me if I could imagine a reason?

Q. Was that the reason you didn't have them offered?

Same objection.

A. You asked me if I could think of a reason.

Q. Was that your reason, was that your reason for not having these records introduced?

Same objection.

A. Why no, I never thought of introducing the records, never thought of it one way or the other, so I could not have had any reason.

Q. You have just stated that these figures are on the books of the Des Moines Gas Co., that is not so is it?

A. I didn't state that.

Q. That is the city might spend speveral months in checking through the separate items of your books.

A. No, I mean that an accountant could probably verify these figures from the books in less than an hour.

Q. Can you now give us any reason why you did not want this book offeree and turnee over to us a day or two ago when we asked for it, or even the city's counsel allowee to look it over?

Same objection.

2884 A. No, I cannot.

Q. You remember this Mr. Cook that was on the witness stand a few days ago from Chicago?

A. Yes, sir.

Q. You remember his testimony about bonds and the N. W. Harris & Company's refusal to do business in Iowa, that is in a general way, you remember that testimony?

Same objection.

A. I have heard so much testimony I would not want to say that I had a very concise recollection of it without reading it.

Q. Who bought the last issue of the bonds of the Des Moines Gas Co.?

Same objection.

A. If you will give me the book you have there.

Q. It was the N. W. Harris company was it not?

A. Oh no. They have not bought any bonds, never did buy any bonds of the Des Moines Gas Company.

Q. Never at any time?

Same objection.

A. No.
Q. They haven't any now?

Same objection.

A. Not that I know of.
Mr. Byers: I wish you would produce for us in the morning the contract that the Des Moines Gas Company had with Mr. William Brereton covering one of the buildings down here at the plant, you can find — can you not?
A. I don't know.

(Des Moines Gas Company minute book marked defend-
2885 ant's Exhibit No. 27.)

Q. The book I hold in my hand called Capital City Gas Light Co. No. 1, stockholders' and directors' minutes is the minute book of that company beginning some time in the 70's?
A. Beginning with the meeting held first September 20, 1875.

Mr. Byers: Defendant at this time /ffers in evidence Exhibit 25 and 26 being stockholders' and directors' minute book of the Capital City Gas Light Company Nos. 1 and 2.
Objected to as irrelevant and immaterial because having no bearing whatever upon the ultimate questions that are involved in this controversy.

Here the further hearing was adjourned until 9:30 A. M. tomorrow.

2886 Thursday Forenoon Session.

August 24, 1911—at 9:30 a. m.

Counsel for the respective parties all present.
Testimony on part of defendants resumed as follows:

Henry I. Lea, re-called for further cross examination, examined by Hon. H. W. Byers, testified:

Q. Mr. Lea, one of the matters that you were asked to furnish was the figures, memoranda, with the figures upon which you based your table of averages on page 12 of your report, the meters on the installment basis.
A. That is all shown in Exhibit 8; that is the only information I have on the meters.
Q. Just what was shown there?
A. Yes.
Q. That is where you got the figures?
A. That is the only source of my information of the age of the mains, services or meters, just those three pages in Exhibit 8.
Q. Now on page 1274 of your examination, you were to furnish me the *the* figures showing the estimated growth of the business from 1910 to 1918 with gas at 90 cents—did you work that out?
A. No, I have not done that.

Q. That was to be worked out on the plan of one of your curved sheets, if you remember, but you haven't done that?

A. No, I have not done that.

Q. And did you get your report from your office, the Beatrice report?

A. I think so.

Q. I have had this one certified, maybe by glancing over it you can tell about it. (Report handed to witness.)

A. I had mine sent out here, but I don't have it with me this mor-.

2887 Q. You will notice here that the City Clerk has certified this is an exact copy af the report as it is filed there?

A. Yes, this looks like a copy of my report.

Q. Now, where did you get your base figures, if that is the correct term, for your cast iron valuations in the report that has been filed here and marked Exhibit 20?

A. That would appear in my details, but I haven't that here.

Q. Can you tell me where you got your base figures for your cast iron valuations in that report?

A. I don't remember any of the details; I would have to get that from my office.

Q. I mean from what sources did you get the prices?

A. From probably the United States Cast Iron Pipe Foundry Company.

Q. Is that where you got them?

A. I wouldn't say without my notes.

Q. Didn't you get that information out of Exhibit 8?

A. Certainly not. I used Exhibit 8 in absolutely no way except to abstract three pages showing ages of mains, meters and services.

Q. Do you have the figures somewhere in the memoranda that shows where you got your cast iron pipe from?

A. They must be in my notes.

Q. I wish you would send them here—you won't need to come back to bring them.

A. All you want to know is the source——

Q. I want the memoranda you used making up your cast iron pipe valuations.

A. Do you wish the pipe by itself?

Q. As I remember it, you show the cost—for instance, here is the way you- report is made up, reading from page 89, under the table sub-headed "Depreciation system street mains, size 2½ inches

2888 and under 35,527 feet?

A. That means the average taken as 2 inch pipe; I have taken 2½ inch and under.

Q. And you have 25,527 feet in length here and the net construction cost of the pipe laid in unpaved streets. Under that table you have $5,373. Now that represents the net construction cost of the pipe laid; is that what you mean to show by the report?

A. You are referring to the 2½ inch and under, 25,527, and no pavement?

Q. No pavement, no.

A. That pipe is totaled .2105 per foot.
Q. Do you mean 21 cents?
A. Yes.
Q. Just a minute there, please. Read the question, Mr. Reporter.

(Question beginning with line 4 read.)

A. Yes.
Q. So that that covers the cost of the pipe, construction cost, and the cost of laying it?
A. It does, *s*object to some errors which I discovered in the unit prices of the 3 inch pipe, in the brick on concrete.
Q. I haven't got to that now—I am dealing entirely now with the pipe that is not under pavement as shown in your report; I am talking about this size now.
A. That is correct. $5,373 represents net construction cost of pipe and labor, finished job in the street, no pavement.
Q. Now how much would that be a ton or a pound?
A. Well that pipe weighs 3.61 pounds per foot. The cost of the pipe based on Crane & Company's price list, less 78.2 per cent, 7.85 cents.
2889 Q. A pound? *Q*. I want to know what it is per ton.
A. We don't buy that by the ton ordinarily.
Q. I find that it appears here by the ton in some of the records and I want to see what it is by the ton.
A. We can get it. (Witness makes computation.) Per ton of 2,000 pounds that pipe is $43.48. That is 2 inch wrought pipe, not cast iron.
Q. Well, is that what you intended it to represent here in your report, wrought iron?
A. Not wrought iron; wrought pipe.
Q. Well it is not so stated.
A. That is always understood among gas men; we don't have to specify, because there is no cast iron pipe made of that size; 4 inch is the smallest cast iron pipe made for gas uses.
Q. Well we are not gas men here. That is $43.48 a ton, and how much did you say a foot?
A. 7.85 cents.
The MASTER: What was the 21 cents?
A. That was the total cost for pipe, fittings, store room, labor, laying, excavation, etc.
Q. So that the labor then and overhead charges, whatever they are in that item, represent about in round numbers 14 cents?
A. I would rather give it to you in items.
Q. All right.
A. Pipe weighs 3.61 pounds per lineal foot; pipe itself would cost f. o. b. Des Moines 7.85 per lineal foot; the fittings cost 4½ per cent of the cost of the pipe alone or .35 of one cent; store room cost would be 2½ of the combined cost of pipe and fittings or .21 of a cent per lineal foot. The cost of hauling and handling would be ½ of a cent.

2890 Q. You are reading from some memoranda?

A. Yes, I am reading from my report. I said ½ of a cent for hauling and handling, and labor in laying 1.3 cents, cost of excavation and refilling, which is based on a trench of the width of 22 inches with an average depth of 36 inches 45 cents per cubic yard for excavation and refilling 9.16 cents, and the miscellaneous items composed of tools, 4 per cent, cutting pipe 3 per cent, lumber and incidental supplies 3 per cent, delays 5 per cent, making a total of 15 per cent, which is added to all the above items, except pipe and fittings, making a total for miscellaneous of 1.68 cents which added to the previous amounts gives you a total of 21.05 cents per lineal foot.

Q. What is the total of the amount less the pipe?

A. That would be pipe fittings 7.81 cents, for pipe; fittings .35 cents, total 8.3 per lineal foot, total cost of pipe laid 21.05 cents, from which you deduct 8.2 cents, leaving 12.85 cents per lineal foot to cover the cost to put in the wrought iron pipe laid in unpaved streets, after you had deducted from the total cost of pipe and fittings.

Mr. GUERNSEY: I would like to ask you again for those items.

A. Pipe 7.85; fittings 1.35; store room .21; hauling and handling .50 labor laying 1.3; excavation refilling 9.16; miscellaneous 1.68.

Q. Now you have proceeded with that same method, with that same substantial addition to the cost of the pipe and fittings throughout the distribution system where the pipe is not under paving?

A. Yes.

Q. And all of these base figures, as I understand you, were furnished to you by somebody for the Company?

A. No, sir; none of them were.

Q. Where did you get them?

2891 A. From my own records and experience. I got no figures as to the cost of main laying from the company; hadn't seen any until my work was done.

Q. You mentioned a moment ago Crane & Company; is Crane & Company in business in Des Moines?

A. I don't know; they have some jobbing houses.

Q. They have the western headquarters at Omaha?

A. Yes, I think so.

Q. Do they handle this class of pipe?

A. They make it.

Q. Is that true of all these sizes?

A. No, they do not make any cast iron. They make wrought iron of larger sizes than we have here, but that is for steam use.

Q. Now take the 3 inch wrought iron, wouldn't it be higher than the 2 inch?

A. In cost you mean?

Q. Yes.

A. Certainly.

Q. What per cent difference?

A. It would be over twice as expensive.

Q. It would be no more expensive as to the other items?

A. Certainly; it is very much harder to put together.
Q. Takes a larger ditch?
A. No, but it is hard to put together.
Q. You used the same substantial method and you figure out how much more it would cost to put it together?
A. Yes, figure each of the items.
Q. And that represented your judgment about it and not figures furnished you?
A. Not by the Des Moines Gas Company.
2892 Q. By anybody?
A. I wouldn't say that; I have obtained figures from a great many people.
Q. I mean as to these figures?
A. Oh, no.
Q. In 4 inch cast iron, the difference there too would be largely——
A. While you are on that, let me point out an error I discovered. The 3 inch wrought iron pipe under brick on concrete pavement was figured 80.32 cents for the pavement alone; the total cost was given as 1.114 cents, which should have been 1.4 cents.
Q. A mistake of ten cents?
A. Yes, under brick on concrete. Then there was another mistake on that 3 inch. An even dollar was dropped out of the record on the inch and a quarter under wood block on concrete.
The MASTER: What difference does that make?
A. A total difference of about $560, against the company as the total of these errors which I found. I found those on the 3 inch pipe.
Q. That one item you had figured 10 cents too high?
A. Yes, 10 cents too high.

The MASTER:

Q. That is the difference in two mistakes?
A. Yes, two or three.
Q. Now, going past the wrought iron to the first cast iron pipe of 4 inch you have 350,664 feet at $195,074. Now do you know where you got your value or the price of cast iron for that item and when you got it?
A. Yes.
Q. Where did you get it?
A. I got it by looking up the records of the fluctuation of cast iron pipe prices for a good many years.
2893 Q. What record did you look up?
A. The records as shown in the Iron Age.
Q. For what year?
A. A great many years; I have forgotten how many, all tabulated by Mr. Alvord some time ago.
Q. Mr. Alvord's tabulation was on water pipe?
A. Yes.
Q. What did you add?

A. One dollar ton.

Q. You used Mr. Alvord's water pipe schedule he used in the water case?

A. No, that is one of the things to which I referred.

Q. That is one of the things you had upon which you based your judgment?

A. Yes, showing 4 inch pipe quotations for the first week in each month, as taken from the Iron Age, beginning with the 1st of January 1885 and carried up to March 1911. That also shows 16 inch and larger pipe quotations, and also shows the average prices of lettings in Chicago and vicinity and the average price of southern coated #1 pig iron quotations.

Q. So that if two engineers were to take the Iron Age and Alvord's table and get at the average price of that class of pipe and add a dollar to it, there ought not to be any difference in their results?

A. Not with that result. I am not saying that is the figure I used.

Q. It is the figure you used?

A. I don't think so.

Q. Just take the 4 inch pipe, what did Mr. Alvord price it here in Des Moines at the time of the Des Moines Water case?

A. I don't know.

2994 Q. You have his schedule here?

A. I have his schedule here, but that is not the price in Des Moines. I have Benezet Williams' price in Des Moines.

Q. What was his price on 4 inch cast iron?

A What year?

Q. The year the case was tried, in 1910?

A. The average cost per ton for a good many years back, I don't remember how many, the average cost per ton was $30.17 in 1910.

Q. It is a good deal less now?

A. Yes.

Q. It was a good deal less the 1st of January this year?

A. I think so.

Q. How much less?

A. I don't know what it was.

Q. It was four or five dollars less than that?

A. It was probably $27.

Q. Even less than that?

A. I am not sure, it might have been $26.

Q. The average for how many years, you say?

A. Apparently from 1871.

Q. To 1910?

A. It appears from this table to be the period covered.

Q. $30?

A. $30.77.

Q. You have a memorandum there you used in February this year to give the quotations on 4 inch cast iron pipe?

A. Yes.

Q. Look at it and see what it was at that time?

A. In February 1911?

Q. Yes.

2895 A. The quotation for 4 inch water pipe was in the neighborhood of $25.50, making it $26.50 for gas pipe.

Q. Is that for Des Moines or Chicago?

A. That is Chicago.

Q. Twenty-five what?

A. $25.50 in Chicago for water pipe.

Q. What would be the difference, if any, between Chicago prices and Des Moines prices?

A. I don't remember what the difference would be.

Q. There isn't any?

A. I think there is some, yes.

Q. You figured it out to find out?

A. I did but haven't it here.

Q. Do you remember the price you put on this kind of pipe at Beatrice, Nebraska?

A. I don't remember it now.

Q. You didn't make any differences between the Chicago price and Beatrice or Omaha price?

A. I don't remember.

Q. There isn't any substantial difference?

A. I believe there is——

Q. Isn't that class of pipe quoted exactly the same in Omaha as in Chicago?

A. I don't believe it.

Q. Anyhow, it was $25.50 in February?

A. Yes.

Q. It was less than that even the 1st of January, wasn't it?

A. Yes, it was $25 the first week in January. There was no pipe moving at that time of the year; you generally find the prices down in January.

2896 Q. Now, 6 inch pipe?

A. What do you want on that, the price per ton?

Q. Yes.

A. $30.

Q. What was that average per year?

A. That is my judgment as to what I would have to pay for pipe if I would come down to put in this system at that time.

Q. And pay for it here in Des Moines?

A. Yes.

Q. What was that pipe on January 1st?

A. I can't say from this chart, because it jumps from 4 inch to 16 inch and larger.

Q. What was it here in February?

A. I haven't it on this chart. I have what I used. I took 6 inch and larger and at $1 less than 4 inch pipe throughout.

Q. You have the 4 inch at what?

A. $31 f. o. b. Des Moines.

Q. I am talking about Beatrice now?

A. I don't know anything — Beatrice now.

Q. You figured at Des Moines even $30.

A. $31 for the 4 inch and $30 for the 6 inch or larger f. o. b. Des Moines all the cast iron pipe in Des Moines.

Q. $30?

A. $30 6 in and larger.

Q. You did that all through your distribution system?

A. Yes, sir.

Q. Now, another thing—you were to furnish me with figures showing the items of expenditures that you stated would have to be made in the next few years here in your total of a million dollars, in the next seven years.

2897 A. I told you I had made some rough figures which run over a million dollars. As I remember it you wanted me to make an itemized statement that involved the preparation of at least some rough sketches and a large amount of detail work which I have not been able to do.

Q. Another thing I asked you about was the memoranda and figures from which the table on pages 10 and 12 of your report was made; you say that was taken from Exhibit 8?

A. Yes.

Q. Another thing was the memoranda which you said you had at the Chicago office furnished by the Des Moines Gas Company, from which the totals on page 1 and 11 of your report were made?

A. What do you mean by page one—organization and legal expenses?

Q. Yes.

A. Certainly not. Page 11 is one of the 3 pages we have been talking about as showing the composite age. All of the data on page 11 is one of the 3 pages I used in Exhibit 8.

Q. Now the figures shown on page 1 is the memoranda that was furnished you by the company covering that?

A. Do you mean what is called page 1 of my report?

Q. Yes.

A. That shows the organization and legal expenses.

Q. Were those figures furnished you?

A. No, sir.

Q. You made those up without any memoranda from the company?

A. Yes.

Q. Now, Mr. Lea, another matter I wanted *tou* to figure out for me—I asked you to furnish to the Master and counsel the figures in separate items, showing the amount that you have allowed in your report in values added to the property, in value, over and

2898 above the reproduction cost of the material itself and labor.

A. I furnished that some time ago. I think I still have it. It was discussed here one day, I remember.

Q. I don't remember seeing it myself.

A. (Witness produces figures). This is it here, showing the total in dollars for engineering, etc., taxes during construction, and loss of interest during construction. You will remember we had that; we were making some figures here.

Q. You can give me from that what I want now. First give me

the amount that you have allowed and as shown by your report, covering contingencies.

A. I have the contingencies here only as a part of the 15 per cent covering engineering, supervision, contingencies and omissions.

Q. How much is that?

A. $232,481.

Q. Now, that covers contingencies, engineering and supervision——

The MASTER: Is that the present value?

A. That is the amount which appears in the reproduction value.

The MASTER: Not the amount which appears in the present value?

A. No.

Q. It gets into the present value all right?

A. Sure it does.

Q. It covers contingencies, engineering, supervision and omissions?

A. Yes—now wait a minute—I gave you $232,481.

Q. Yes; that is for the distribution system alone?

A. The total including $5,000 on real estate, $12,858 for buildings; $63,072 for works equipment; and $232,481, engineering, etc., is $313,411; that is the total amount included under my 15 per cent addition.

Q. Now a little more than half of that represents omissions?

2899 A. Yes, 8 per cent.

Q. It would be divided in the ratio of 8 to 7?

A. It would be 8/15—no, before you get that you would have to deduct your $5,000 which goes in on real estate.

Q. What was that?

A. That was for sinking test holes and engineering.

Q. Anyhow, you make these items $313,411?

A. Yes.

Q. Now, then take legal and organization expenses?

A. That is shown in the report.

Q. Just give me the amount?

A. You want the total allowance for organization and legal expenses?

Q. As you have it.

A. That is shown in the report, of course, page 1 shows the total organization and legal expenses $68,023.

Q. Is that the total that enters into your final figures?

A. Yes, $68,023 in that sum is included $1,429 for taxes during construction, and $4,594 for loss of interest during construction.

Q. So that there are in addition to legal expenses and organization these two items of taxes and interest?

A. Yes, shown on page 1 there. I think if you want to get the — straight, you had better take the net construction.

Q. No, this is what I want. I want it for the purpose of comparison with these other reports. What rate of interest did you figure during the construction that is included in this?

A. I figured at the rate of 2¼ per cent per year, where the material was subject to taxation for the full year.

Q. What rate of interest I said?

A. 6 per cent.

Q. You figured it for the full year?

2900 A. Where the money was in use the full year. Where for instance a thousand dollars was put in during the year, that would be figured at six per cent for one half year.

Q. Now take the four items you have mentioned, legal expense and organization, taxes and interest during construction, etc., and the total is what?

A. $68,023.

The MASTER: Is that the amount of interest on the organization expenses or the whole interest you allow?

A. That is the interest on organization expenses, for that purpose up to the time when gas is beginning to be manufactured.

Q. The same thing is true of the taxes?

A. Yes, sir.

Q. In other words, those four items, legal expenses and organization, taxes and interest are all involved in one item?

A. The legal organization is ahead of my report, to which I have added the other items.

Q. Exactly. You have taken what you thought, without respect to any figures furnished to you by the company or anybody else, what you thought would be necessary for legal charges or expenditures and organization expenditures, and what you thought ought to be on hand at the beginning of the construction?

A. Yes.

Q. And then upon that sum figured out in your way, without any basis being furnished by the company, you allowed interest during a part of the time on some of this money that was laid aside for legal organization, and also the tax on some of it.

A. That is correct.

Q. But not all of it?

A. The tax on all of it subject to taxation. For instance

2901 if you spend a thousand dollars this year on your organization and legal expenses, that thousand dollars must be added to your capital and the tax must at the same time be paid on that; they tax the property plus that, but in my report I had to handle it separately.

Q. You simply increased your organization and legal expenses by the amount that you allow for interest and taxes and the total makes $68,023.

A. That is right.

Q. And the total taxes covered by your report find their way into the valuation of the property?

A. The total amount of tax, including $1,429. added to organization and legal expenses.

Q. I want you to leave that out.

A. The total amount included in my reproduction values for the item of tax during construction is $72,759, from which for your pur-

pose you deduct $1,429. I have already given you under the head of organization and legal expense, and you have $71,330. left.

Q. The total amount of interest that you have figured that finally found its way into the value of the property?

A. The total amount of loss of interest during construction entering into my reproduction totals is $196,529. from which you deduct for your purpose $4,594. previously explained as belonging under organization and legal expense, and you have $191,935.

Q. Now, the total amount of going value you have got in.

A. $583,000. That appears in both reproduction and present value.

Q. Now the amount of capital?

A. Working capital, the net construction equivalent of working capital I have $142,000. but the actual amount as shown in my report when segregated as to the working capital, would
2902 have to include from the figures previously given to you $2,412. for taxes during construction and $6,484. for loss of interest during construction, properly chargeable to working capital.

Q. That would make in round numbers $150,000?

A. Whatever my report shows.

Q. But you have it there at $142,000.

A. That is without taxes or interest.

Q. Now the total amount that you have allowed for mains under pavements that finally finds its way into your total present value?

A. For the item of paving alone over mains and over services, I have included in my reproduction cost a total of $49,584. for engineering, casualty liability, supervision, omissions and contingencies, making up the 15 per cent previously explained, and $10,279. making up the total taxes during construction chargeable to paving, and $27,662. for loss of interest during construction. The total of the 15 per cent representing engineering, etc., and all the tax during construction, and all the loss of interest during construction which I have added in my reproduction cost to my net construction cost of tearing up and replacing pavement over mains and services is $87,525.

Q. But that is not the total I want.

A. That is the total for that head.

Q. I want the total amount that enters into your report under the head of paving as shown.

A. To this $87,525. you would have to add the net construction cost of paving, the net construction cost of paving over mains $277,574. of paving over house services $48,276. of paving lamp services, $4,708. or a total net construction cost covered by the item of paving of $330,558. Adding to this latter amount the total for engineering, etc., and taxes and loss of interest during con-
2903 struction, the figure $87,525. previously given, you have the total amount $418,083. appearing in my total reproduction cost under the head of paving.

Q. Well, I don't think you are giving that to me just as I wanted it. This figure $418,000 would be duplicating some of those other items?

A. $418,000 is the total which I understood you to ask for.
Q. I have already got the total taxes.
A. The net construction is $330,558.
Q. The engineering as I understand it, is all up in this other item?
A. Yes.
Q. That item $313,411. covered all the engineering?
A. Yes, whatever place you may find it.
The MASTER: I figured on $277,000; I think it was about 61.1 per cent per lineal foot for the pavement on an average.

A. The total included in the reproduction covering all the overhead the final figure appearing in the reproduction cost for paving is $418,083. You reduce that to the foot basis and I don't know where that would be.
Q. Where did you get your unit price for paving, say take asphalt, in Des Moines?
A. I got some figures here and compared them with figures in other cities.
Q. What was the figure you got here?
A. Street paving, asphalt, on 5 inches concrete, the price I got here ranged from $2 to $2.50 per square yard.
Q. That lowest price you have there is about 30 per cent higher than it is being done for right now?
A. Not as I understand it.
Q. Who did you get those figures from?
2904 A. There are four figures here from three firms.
Q. Who are the firms?
A. J. C. Mardis——
Q. He is not in the paving business.
A. I don't know his business, except that he is a contractor and he gives a price of $2.25 per square yard, all on large work.
Q. Mardis is a builder?
A. All right.
Q. Who else?
A. W. H. Brereton. He gives it at $2. to $2.50 per square yard. Charles Weitz & Sons, at $2.10 per square yard.
Q. They are not in the paving business?
A. I don't know.
Q. Neither is Brereton?
A. I don't know.
Q. You knew who was paving here?
A. I did not.
Q. You didn't make any inquiry of people that were in the business?
A. I supposed those people were. All I wanted to know was whether those prices were used here.
Q. In other words, you didn't care who gave you the prices: you would rely on it no matter whether they knew what they were talking about or not?
A. Is that what you gather from my remark? That is not what I said.

Q. What is your total Mr. Lea, of these items you just so kindly gave me without any evidence?

A. I don't know what you want now.

Q. I started with the $311,411.

A. That is the total for engineering, etc.

Q. Give me the total now of all those figures, engineering,
2905 legal organization—if you will just follow me and put the items down—contingencies, engineering and supervision and omissions $313,411.

A. Yes.

Q. Taxes and interest $68,023.

A. Yes; legal organization including taxes and interest.

Q. Taxes $71,330.

A. Yes.

Q. Interest during construction $191,935.

A. Yes.

Q. Going value $583,000.

A. Yes.

Q. Working capital, less taxes and interest, $142,000.

A. Yes.

Q. Paving $303,558. Now add those together.

A. (Witness computes). The total of these items is $1,700,257

Q. Now does that amount enter into the reproduction cost before the depreciation is taken off?

A. Yes, the depreciation is not taken out until the total reproduction cost is arrived at.

Q. Then the total reproduction cost as shown here on the first page of your report Exhibit 20, is what?

A. $3,641,714.

Q. Then if we reduce that amount by the $1,700,257 we get your reproduction cost of the property?

A. You certainly do not.

Q. What do you get?

A. You can only get my reproduction cost of the property by taking the total $3,641,714.

Q. I meant the net construction cost?

2906 A. You would have the net construction cost of the physical equipment alone, including real estate.

Q. That is what I am trying to get at, and that result worked out would be $1,941,457.

A. Yes, sir; that is right.

Q. Now, Mr. Lea, just a word or two and then I am through. You stated in your examination before, and quite emphatically too, that no engineer would undertake to place a value on property of this kind without considering omissions and allowing a certain per cent for omissions; you still adhere to that, do you?

A. Yes.

Q. You did not do it at Beatrice?

A. At Beatrice the case was radically different. At Beatrice I was not expected to render a detailed appraisement of the property except on such matters as were provided for in the agreement. Both

parties had agreed as to a very great many facts in the case, and they presented them to me to pass on.

Q. You made up for them what you claim a replacement value of the property?

A. Yes.

Q. And you say this: The replacement value of all the foregoing, with the exception of the real estate and the lease, must be added 15 per cent to cover the following items: engineering 5 per cent; interest during construction 5 per cent; legal and organization expense 3 per cent; casualty liability 2 per cent; total 15 per cent. You used the same figure exactly, 15 per cent, but you have nothing in it for omissions?

A. Yes.

Q. Could you take your report and give us the details with
2907 respect to prices on concrete and paving and excavation?

A. Yes.

Q. Your base figures?

A. Yes.

Q. Where did you get them?

A. I didn't get them all in one place; I have been over all parts of the United States and have been gathering this stuff for fifteen years.

Q. Whatever figures you got, whatever valuation you placed upon local prices, was due to either a party furnishing them to you or your approval of them in comparing them with what you knew in a general way over the country?

A. It was the latter in every case.

Q. So that your figures are made up in exactly the same way that engineers usually get at the value of a given piece of work in a locality?

A. Yes, sir.

Q. They are not based in any case upon exact prices for the locality where the property is?

A. That would be physically impossible, as you can see, by referring to the local contractors here; they do not agree on anything themselves as to the price of lumber etc. I got as to the details that enter into the buildings figures from three leading contractors, and they do not agree at all.

Q. So that what you have to do and what you did do, you took such prices as you could get?

A. I didn't take the highest nor the lowest.

Q. You took such prices as you could get locally and then you compared them with similar work in other places and similar prices
that you had verified, and if the local prices did not appeal
2908 to your judgment, if you thought they were too low, you did not accept them; if you thought they were too high, you did not accept them, and from them and all this other information you have, worked out what you thought would be a fair figure for the particular job?

A. That is true, if you put this addition to it; if a local price appeared too low to me, I wanted to know why; if there could be no

satisfactory reason given to me, I assumed the price was abnormal and I didn't use it.

Q. If it seemed too low you concluded it was not at all the general range of prices for that work but was a price which was probably affected by some local condition temporarily?

A. That applies also where the price is too high. I did not want to base a report on an abnormal condition on either side.

Q. Then in getting your unit values, if I understand you, you were obliged to rely upon quotations and statements of prices, locally and at other places, and such figures as were furnished to you, if any were furnished by the local company, and in that general way you fixed your unit prices?

A. I wouldn't want to leave it on as flimsy a basis as you have it. My figures are very largely from actual contracts, actual construction and actual quotations made.

Q. I am afraid we are getting into deep water there, because actual contracts here you actually ignored?

A. Certainly.

Q. If you had taken the actual contracts here some of your prices would have been a good deal different?

A. They would.

Q. If you had gone to the books of the company you would find actual contracts at a very recent date that did not compare
2909 with your figures?

A. If that is true, that is caused by an abnormal condition existing here.

Q. No, it was not abnormal either. It is safe to say is it not, in getting at these unit prices you were compelled to rely largely on quotations and on prices that you in the past had verified as being about reasonable for that class of work?

A. I was not compelled—I presume the company would have given me access to the books, but I did not want to know what the company said it was worth.

Q. Aside from that then, you take, as I understand you, you take such quotations as you can get, and such information as you got from Alvord's chart or schedule, and then use your own judgment finally to strike what you thought was a fair figure?

A. Alvord's chart played a very insignificant part in my estimates. I obtained that chart after I had arrived at my unit cost of pipe.

Q. It happened to agree?

A. It happened to show that my judgment had been all right as to the range of prices in the past.

Q. Of course, it wouldn't be fair to suggest even that finally your figures happened to coincide with Alvord's and that therefore you took them from Alvord's?

A. They do not coincide with Alvord's at all.

Q. Are they higher or lower?

A. I think they are higher; they should be.

Q. Just one thing further and I think I am through. You stated did you not that you made a report over at Taylorville?

A. I believe I said I made a report, a verbal report; I did make

a report to the company; I did make a written report to the
2910 Company.

Q. Have you got it here with you?

A. I am not sure. No I got to Taylorville and had to make a hurried report there, and my report was just a pencil memoranda which I dated, addressed, filled out and signed.

Q. You better look that up a little more.

A. I am very sure about it; I remember it distinctly, that is all there was in the way of a report at Taylorville.

Q. There was no trial there, as you said?

A. I didn't mean a trial before the court; I think I said before the board of arbitration.

Q. Were you present?

A. I certainly was present.

Q. For how long?

A. I think two days.

Redirect examination by Mr. GUERNSEY:

Q. In the first place, Mr. Marks complained more or less because he was furnished a blue print of these drawings instead of a white print. I would like to have you state whether the company furnished to you blue prints of these drawings or white prints?

A. No, they furnished blue prints.

Mr. BYERS: In connection with this cross-examination the defendants offer in evidence the Defendants' Exhibit No. 6.

Objected to on part of complainant as irrelevant and immaterial so far as this case is concerned.

Mr. GUERNSEY: Now one other thing. Will you at your convenience make up and file with the Master a memorandum
2911 showing as to each size of pipe the factors going into your unit price, and the unit price, including the cost per ton of pipe, which you took, f. o. b. Des Moines, the weight per foot, and then each item which you used to make up your unit price, and the unit prices?

A. Yes, sir.

Mr. BYERS: Of course if that is to be offered, we would want to examine the witness with reference to it.

Mr. GUERNSEY: I simply thought we would save a little time in doing this.

The WITNESS: I can make it now if you want it.

Mr. BYERS: The defendants at the close of the cross-examination of the witness Lea, with respect to his report which had been marked in this Complainant's Exhibit 20, in addition to the objections heretofore urged to the report, now object to it because it fully appears from the testimony of the witness himself that it is a mere memoranda of conclusions, arrived at by the witness by the use of other and different memoranda, quotations and tables of figures and prices, which has not been identified and which are not offered as evidence in this case. We further object to the exhibit for the

reason that it is largely hearsay and purports to give a record of operations of the complainant company's business, which is mere hearsay, it has not been identified by any witness, is not the best evidence and is incompetent and immaterial. And we move to strike the report from the record for all the above reasons.

Excused.

2912 W. F. DOUTHIRT, continuing his direct examination, examined by Mr. Byers, testified:

Q. You stated yesterday, Mr. Douthirt, as one reason for the allowance of the $10,000 so-called salary, which goes into the treasury of the United Gas Improvement Company, one reason for which you justified it, was because that corporation had performed services for the Des Moines Company it had never been compensated for; do you know just what compensation the United Gas Improvement Company has had out of the Des Moines business? I will hand you the minute books of the stockholders' meetings and let me see if you can tell me from them what dividends the United Gas Improvement Company has taken out of this business before 1906?

Same objection.

A. Well, without looking at the books, I would say that dividends are a return on capital and not a compensation for services.

Q. I know it is a return on capital. I want to have some idea what you considered a fair return on capital, and then what you think how much ought to be allowed?

Same objection.

A. The matter of a fair return on capital is probably a question of law——

The MASTER: Answer the question.

Q. I want to know what dividends the U. G. I. got from the Capital City Gas Light Company.

Same objection.

A. From the investment in stock of the Capital City Gas Light Company?

Q. Yes; I don't care how they got it.

Same objection.

A. How far back do you want me to go.

2913 Q. Well back to 1895 or '96, along there?

Same objection.

A. (Witness examines books.) I think I have found upon the minutes of the Capital City Gas Light Company the matter to which you refer. It is in volume 2 of the stockholders' and directors' minutes of the Capital City Gas Light Company, commencing about the middle of page 17 and is as follows:

Q. Is that the only thing you find where dividends have been declared?

Same objection.

A. The only place in the years 1895 and 1896.

Q. Well, I did not limit you to that; any time from that time on down to 1906?

Same objection.

A. I am not prepared to say that is the only place, except it is the only place down to 1897.

Q. Of course, I intended to cover all from 1895 down; but let us have that.

Same objection.

A. "Thereupon A. B. Cummins offered the following preamble and resolution:

Whereas, prior to this meeting the authorized capital stock of the Capital City Gas Light Company was Three Thousand (3,000) shares of One Hundred Dollars ($100.) each aggregating Three Hundred Thousand Dollars ($300,000.), and

Whereas the capital stock has been increased by amendment duly passed and adopted to six thousand (6,000) shares of One Hundred Dollars ($100.) each, aggregating Six Hundred Thousand Dollars ($600,000.) and

Whereas, the property of this company, real and personal, including its rights, franchises, privileges, contracts, immunities, is of the fair value of Six Hundred Thousand Dollars ($600,000.) after deducting its indebtedness, and

Whereas, the present stockholders are entitled to the said increase in capital stock;

Now, Therefore, be it resolved and the board of directors is authorized and directed to make a stock dividend of the said increased capital stock, to-wit: of three thousand (3,000)
2914 shares and to cause to be issued and delivered to each of the stockholders according to his holdings, as appears from the books of the company, his ratable proportion of the said increase of capital stock, which capital stock shall be issued fully paid up and non-assessable.

Whereupon A. B. Cummins moved the adoption of this resolution, which motion was duly seconded by W. B. Keffer and after being duly considered by the stockholders of the corporation was adopted by the affirmative vote of all the stockholders. Whereupon the presiding officer declared the resolution to have been unanimously passed and adopted."

Q. At that point, who owned the stock of the Capital City Gas Light Company at that time?

Same objection.

A. I can only refer to the record. While I was not in the employ of the United Gas Improvement Company at that time, I suppose they did.

Q. You know that; there is no supposition about it?

Same objection.

A. I am morally certain, yes.
Q. Mr. Cummins, he was simply the attorney.
Same objection.

A. Yes.
Q. That record means that at the time the United Gas Improvement Company received a dividend in amount and in value of the sum of whatever that three hundred thousand dollars in stock was worth?

Same objection.

A. No, I wouldn't say that.
Q. What would you say?

Same objection.

A. If the United Gas Improvement Company owned all the stock before the increase and then got all of the increase, I wouldn't say they had any more in value than they had before; simply
2915 the value was represented by more shares.
Q. How would it be when they come to figure returns and when they sell the property?

Same objection.

A. When they come to figure the returns, I don't think it would make any difference at all, because as I understand the matter, a return is figured on the present worth of the property and assets, irrespective of whether it is capitalized for two or three times that present worth, or whether it is capitalized for only a fraction of that present worth.
Q. Was this capitalized for more than its present worth?
Same objection.

A. To what do you refer?
Q. This property of the Gas Light Company at that time, when this increase of capital was voted.

Same objection.

A. Why, this was in 1896. I have no knowledge of the worth of the then present worth of the property and assets of the Capital City Gas Light Company, further than what appears upon the record.
Q. Would there be any difference between what they did at that time, except in the character of the property, between what was done there and the distribution of the $300,000 surplus, if they had it laying in the bank in dividends?

Same objection.

A. Decidedly.
Q. What would be the difference?

Same objection.

A. In the case of a distribution of a surplus lying in the bank, the stockholders would get cash and the assets of the company would be reduced by that amount.

2916 Q. How about this stock; did that affect the company in any way?

Same objection.

A. That did not affect the company, did not affect the assets of the company; it neither increased nor reduced the assets of the company. It simply resulted—

Q. Did it affect the liabilities in any way?

Same objection.

A. No; in a bookkeeping sense it doubled the liability on account of capital stock, but as a capital stock liability is carried in bookkeeping it is a liability which does not have to be paid.

Q. What was that stock worth in your judgment at that time?

Same objection.

A. I have no judgment on the subject.

Q. What was it finally worth?

Same objection.

A. I have no judgment.

Q. What did they finally get for it?

Same objection.

A. For the $300,000 then issued, or for the total $600,000 that was outstanding after the issue?

Q. Well, either way.

Same objection.

A. Well, specify please.

Q. Well, take it first the $600,000.

Same objection.

A. According to my best knowledge that stock was held until March 1, 1906, when the Des Moines Gas Company was organized, and then the Des Moines Gas Company paid out certain securities to the Capital City Gas Light Company in payment for its property and assets.

2917 Those securities were ultimately distributed to the owners of the $600,000 of stock of the Capital City Gas Light Company.

Q. How much did they get for the $600,000 in stock?

Same objection.

A. In what?

Q. In anything—money, property or bonds or whatever it was?

Same objection.

A. I will give these amounts in just as little time as possible. I want to take them from the record.

Q. You have some recollection about it without the record haven't you—I will not quarrel about that—if you prefer to take it from the record you may do so.

Same objection.

A. It all appears upon the record and it would seem to me the best way to answer the question would be to read part of the record.

Q. I want to get the amount in the concrete form; the amount now that the books show. They ought to show what was paid either in money or stock or bonds or security of the Capital City Gas Light Company for the property that we have been talking about and which is covered by their stock of $600,000?

Same objection.

A. By the records of the Capital City Gas Light Company stockholders' and directors' minutes, volume 2, and especially by the minutes of the directors' meeting of February 28, 1906, which commenced on page 123, it appears that the Capital City Gas Light Company received for the sale of its property and assets to the Des Moines Gas Company, subject to $400,000 bonds then outstanding, the following securities of the Des Moines Gas Company: $2,249,-
000. face value stock; $800,000 face value preferred stock con-
2917a tracts; $240,000 face value bonds of the Des Moines Gas Company. It further appears by the minutes of the same meeting that the Capital City Gas Light Company used $120,000 face value of the $240,000 face value of bonds of the Des Moines Gas Company in settling the indebtedness of the Capital City Gas Light Company, other than its $400,000. of mortgage bonds then outstanding, which indebtedness according to the records amounted to $105,526.49. So that after settling this indebtedness the Capital City Gas Light Company appears to have had on hand as the net proceeds of the sale of its property the following securities of the Des Moines Gas Company: $2,249,000. stock; $800,000. preferred stock contracts; $120,000. bonds.

Q. Of course I did not ask you to confuse that statement with that debt. I simply wanted the amount of the property bought. Of course, I can figure that out afterwards. The debt, as I understand it, was the debt of the Capital City Gas Light Company?

Same objection.

A. The $105,526.49 was the entire indebtedness of the Capital City Gas Light Company other than its $400,000. outstanding mortgage bonds; a part of the proceeds of the sale of its property it applied to the liquidation of that debt; and the balance of the proceeds remaining on hand were distributed to the stockholders.

Q. That did not reduce the amount it received?

Same objection.

A. But did reduce the amount finally distributed to the stockholders.

Q. Well, the total amount of these items that you have just given there is $3,289,000.

Same objection.

A. The total amount of the three items which were received as consideration for the property was $3,289,000.

2917*b* Q. Now, then, that was the amount in securities and stocks that the Capital City Gas Light Company received from the Des Moines Gas Company in March or February 1906?

Same objection.

A. Yes, and——

Q. Just a minute—out of that they paid a debt of $105,000?

Same objection.

A. Yes, $105,526.49.

Q. And that was a debt to the U. G. I.?

Same objection.

A. Yes.

Q. And they paid that with $120,000 of these bonds which were subject only to $400,000. issued ahead of it?

Same objection.

A. Yes.

Q. And the U. G. I. took $120,000. to pay its debt of $105,000.?

Same objection.

A. Yes.

Q. That left $3,169,000?

Same objection.

A. Yes, that is right.

Q. At that time the stock of the Des Moines Gas Company was all owned by the U. G. I. wasn't it?

Same objection.

A. Why, no.

Q. Who did own it?

Same objection.

A. It was owned at that time by the Capital City Gas Light Company.

Q. They didn't own the stock in the Des Moines Gas Company?

Same objection.

2918 A. Yes, they received it from the Des Moines Gas Company.

Q. After the transfer, but who owned it before?

Same objection.

A. Nobody owned it before.

Q. There was none issued—it was issued and transferred at once, was it?

Same objection.

A. Yes.

Q. Nobody owned it before?

Same objection.

A. No.

Q. And the U. C. I. owned it immediately upon its issue?

Same objection.

A. No, the Capital City Gas Light Company.

Q. I know, but the U. G. I. owned the stock back of the whole business?

Same objection.

A. Yes.

Q. And this $3,169,000. of securities that were turned over to the so-called Capital City Gas Light Company was distributed in the form of dividends, stock dividends to the U. G. I. Company?

Same objection.

A. I think the record is the best evidence of that.

Q. Isn't that so?

Same objection.

A. It appears by the record as follows: Resolved that upon receipt by this company of the shares of stock, bonds and preferred stock contracts to be delivered in payment for the property, real, personal and mixed, and the franchises of this company, the same, except as is required to pay and discharge the debts of the
2919 company, as set forth in the resolution next preceding, be distributed pro rata to or upon the order of the stockholders of the company, as a dividend in liquidation, such dividend being this day hereby declared and ordered paid as aforesaid.

Q. You just told the Master, Mr. Douthirt, you were at that time, as I understand you, a member of the board of directors of this corporation?

Same objection.

A. Which corporation?

Q. The Des Moines Gas Company?

Same objection.

A. No.

Q. You were secretary of the U. G. I.?

Same objection.

A. Yes.

Q. Now you tell the Master, will you, Mr. Douthirt, at that time when you say the record shows that the resolution passed directing the distribution, who it was finally distributed to and who got it?

Same objection.

A. The United Gas Improvement Company.

Q. Now, how much did they get?

Same objection.

A. They got $2,249,000. face value stock of the Des Moines Gas Company; $800,000. face value preferred stock contracts of the company; $120,000. face value of bonds in the same company, making the total which you have mentioned of $3,169,000. securities of all character.

Q. And it received also a $15,000 margin on its debt of $105,000?

Same objection.

2920 A. Well, if you want to put it that way.
Q. That is right, isn't it?

Same objection.

A. No, I wouldn't say so.
Q. Wasn't that $120,000. it got gilt edge security?

Same objection.

A. Will you define gilt edge?
Q. Well, worth a hundred cents on the dollar?

Same objection.

A. No, I don't think so.
Q. Why not, why wasn't it?

Same objection.

A. Well, I can only give you my personal judgment; I wouldn't pay that for it.
Q. What property was behing it—security—what do you say was the value of the property behind as security?

Same objection.

A. I express no opinion as to that; I entertain no opinion as to that.
Q. Why?

Same objection.

A. Simply because I don't.
Q. You know what property the Capital City Gas Light Company had?

Same objection.

A. Yes.
Q. Do you mean to say that the property of the Copital City Gas Light Company was not sufficient value at the time that transfer was made to make a $240,000. issue of gold bonds, subject only to $400,000. worth par?

Same objection.

A. It would depend on——
2921 Q. No, just answer that question.

Same objection.

A. Five per cent bonds—no.
Q. All right. Now this $3,169,000. of securities that the Capital City Gas Light Company received from the Des Moines Gas Company included in it 2,249 shares of stock that were issued over and above the preferred stock and the $240,000. in gold bonds?

Same objection.

A. You got your figures wrong: 22,490 shares.
Q. All right; so that whatever they may be said to have been

worth this bunch of securities, that is what the U. G. I. finally got out of its investment in the Capital City Gas Light Company up to March 1, 1906, isn't that so?

Same objection.

A. On February 28, 1906, the U. G. I. investment in the Capital City Gas Light Company was represented by $600,000. Capital City Gas Light Company stock. On March 1, the next day, that same investment was represented by these other securities; there was no change in the investment or property. Simply a change in the securities which represented whatever it was.

Q. Why was the change made, why was the book value of this property, counting the stock as having some book value, increased from $600,000 to over $3,000,000. over night, what was the purpose of doing that?

Same objection.

A. The Capital City Gas Light Company was capitalized as follows: $600,000. worth of stock; $400,000. worth of bonds; all were issued and outstanding. You will note there is a ratio of two-thirds which is the limit of indebtedness permitted by the
2922 laws of Iowa. There was no way in which the Capital City Gas Light Company could issue any bonds to raise money for additional improvements. The City of Des Moines was growing rapidly, and large sums were required for additions, betterments and extensions, and I may say in passing, one of the most important problems in the management of these public utilities in a rapidly growing city like yours, is the financing of their natural requirements for betterments and extensions and to keep pace with the growth of the town and reasonably meet the public demand for service. This old corporation, the Capital City Gas Light Company, was in a situation where it could not issue bonds to raise money for the purposes I have mentioned. Therefore, this reorganization was planned, the principal reason being, to provide in the course of the reorganization a new issue of bonds which would take care of the requirements of the future for some reasonable length of time. So this authorized issue of $1,500,000. was provided, of which $400,000. were set apart to retire the then existing bonds of the Capital City Gas Light Company which were not due and could not be paid until about two years or more later. $285,000. of bonds were issued to take care of certain construction, which is in part mentioned in the minutes, which had therefore been made—the million foot holder had been erected by the Capital City Gas Light Company, and had no means of paying for it, so the United Gas Improvement Company had advanced the money and carried it for the Capital City Gas Light Company. The Valley Junction property had been built, or certain real estate had been acquired, by the Capital City Gas Light Company, and that had to be carried by the United Gas Improvement Company. Other apparatus which I cannot describe in detail had been installed and were carried by the United
2923 Gas Improvement Company, because the Capital City Gas Light Company had no means of paying for it. All of these

things were paid for out of this $285,000. of bonds which was the only amount of bonds issued by the Des Moines Gas Company at the time of its organization; that with the $400,000. bonds set aside to take care of the outstanding bonds of the Capital City Gas Light Company, makes $685,000. Those $400,000. bonds have since matured and have been met out of the new bonds reserved for that purpose. The authorized issue of bonds of the Des Moines Gas Company was $1,500,000. of which $685,000. was issued or appropriated at the time of the organization, leaving a balance of $185,000. available for future betterments under the terms of the mortgage; and the principal purpose in planning this whole reorganization was to get the matter in shape where there would be securities of a salable character available for issue to take care of the requirements of the property, for improvement and betterments, to meet the demands of the public service.

Q. Why didn't the U. G. I. do that by increasing the stock and paying for its stock?

Same objection.

A. Because the U. G. I. like any other concern, has to get, in some way, from the companies in which it is interested a security which it can market and sell. It cannot and no other concern can go on indefinitely advancing money to companies in which it is interested and receive from those companies only an unmarketable security. It must receive at least a substantial portion of the advance which it makes in the security which is marketable, out of which it can recoup itself for the advances.

Q. Was there anything added to the value of that prop-
2924 erty in that over-night transaction?

Same objection.

A. Not a dollar.

Q. It was worth no more afterwards than before?

Same objection.

A. No, except it was probably put in shape where its security issues were such that it could be more readily provided for the future; whatever that was worth, added to the value.

Q. That is to say, you had put $22,490 shares of stock which did not represent a dollar in money, into circulation somewhere?

Same objection.

A. Well, I can't say that; we sometimes call that watering. I can't say that the securities in the aggregate, outstanding on the morning of March 1, 1906, were worth any more in the aggregate than the securities outstanding on February 28, 1906, except to this extent, that they were then in a condition where part of them could be realized upon, and further than that a provision was made in the authorized mortgage for the issue of the additional securities in the future, which would probably be marketable, to obtain the moneys required for betterments. What over that change may have added to the property was added; other than that there was none.

Q. In other words, by that transaction you were able to increase the obligations of the concern without furnishing any further property security; that's right, isn't it?

Same objection.

A. Do you include capital stock as an obligation?
Q. Everything.

Same objection.

A. Then I will answer your question yes.

2925 The MASTER: I have my doubts about it being an obligation. The Supreme Court has decided it both ways.

Q. If I understand you Mr. Douthirt, coming down to this moment, the United Gas Improvement Company received in exchange for its property, whatever it was, you say it was the night before this transfer, what represented $600,000.

Same objection.

A. I say it was represented by $600,000 worth of stock and entertain no opinion as to its value.

Q. The United Gas Improvement Company received for that property in addition to whatever it got out of the preferred stock and the bonds that were issued, the 22,490 shares of stock in the Des Moines Gas Company, that is right, isn't it?

Same objection.

A. That assumes that it got something out of the preferred stock contracts and the bonds.
Q. Well, did it?

Same objection.

A. You mean were they sold at that time?
Q. Did the United Gas Improvement Company get them?

Same objection.

A. It got them.

Q. Now, let me put it in another way. In addition to whatever it received of the $800,000 preferred stock contracts, and whatever, if anything, it received out of this $240,000 gold bonds, it received 22,490 shares of stock of the Des Moines Gas Company?

Same objection.

A. I think there is a little confusion in the language of that question; I don't mean to say it is intentional, but I think there is.

2926 Q. I don't catch it just now myself. What I mean is the United Gas Improvement Company got these 22,490 shares of stock in addition to the other items, whatever they were?

Same objection.

A. Yes, it got 22,490 shares of stock in addition to $800,000 of preferred stock contracts and $120,000 bonds.

Q. And it still has that stock?

Same objection.

A. Yes.

Q. Now, what is the Capital City Gas Light Company's stock worth, what was it worth on the day before this transfer to the Des Moines Gas Company?

Same objection.

A. I entertain no opinion.

Q. Was it worth anything?

Same objection.

A. I have no doubt it was worth something.

Q. Give us your judgment as to what it was worth?

Same objection.

A. I have no judgment.

Q. What was its book value?

Same objection.

A. I have no knowledge.

Q. Haven't you looked that up?

Same objection.

A. No. You mean its book value on the books of the Capital City Gas Light Company?

Q. Yes, sir.

Same objection.

A. No, I haven't looked that up.

2927 Q. What is that stock worth now?

Same objection.

A. Of the Capital City Gas Light Company?

Q. No, the Des Moines Gas Company stock?

Same objection.

A. I entertain no opinion on that.

Q. Is it quoted anywhere

Same objection.

A. It is not.

Q. Is it for sale any where?

Same objection.

A. No.

Q. It is all owned by the United Gas Improvement Company?

Same objection.

A. Yes.

Q. You are the secretary of the company?

Same objection.

A. Yes.

Q. And a director?

Same objection.

A. No.

Q. When did you cease to be a director?

Same objection.

A. I never have been a director in the United Gas Improvement Company.

Q. You are a director however in the Des Moines Gas Company?

Same objection.

A. Yes.

Q. And the secretary of the Des Moines Gas Company?

Same objection.

A. Yes.

2928 Q. And you can't give the Master any idea of the value of those 22,490 shares of your company's stock?

Same objection.

A. I said I never formed any opinion.

Q. You haven't any opinion about it now?

Same objection.

A. No.

Q. You don't know whether it is worth any more or less than in 1906?

Same objection.

A. I should say it was worth more now than then.

Q. How much more?

Same objection.

A. I don't know.

Q. A thousand dollars more?

Same objection.

A. I don't know.

Q. Ten thousand dollars more?

Same objection.

A. I don't know.

Q. A million more?

Same objection.

A. I don't know.

Q. Now, Mr. Douthirt, I wish you would tell me how your company manages its finances in this respect. If I should want to know just how much money went into the treasury of the United Gas Improvement Company from the Des Moines Gas Company each year, where would I go to ascertain that fact?

Same objection.

A. The books of the Des Moines Gas Company.

2929 Q. Would they show it?

Same objection.

A. Yes.

Q. In what way do they show it?

Same objection.

A. Any payment made to the United Gas Improvement Company will show there.

Q. Payments, what do you mean, what for, what way?

Same objection.

A. There is on the books I think a running account between the two companies—something like standard forms of stationery supplies, and of that nature.

Q. This company here can't spend any money at all except in small sums, $50 or under, without the authorization from the Philadelphia Company—where is the money that has been received by the Des Moines Gas Company from its sales of gas in the last five years?

Same objection.

A. Where is it?

Q. Yes; where will it appear on the books as having finally gone into somebody's account other than the Des Moines Gas Company?

Same objection.

A. Its ultimate disposition will appear on the books of the Des Moines Gas Company.

Q. In what way—suppose the Des Moines Gas Company on the 31st day of last December had $135,000 in money, what would it do with it?

Same objection.

A. Why, if it had bills that were due and were to be paid, it would pay them. If they had any other——

Q. What do you mean by bills?

Same objection.

2930 A. Bills for materials.

Q. I mean after the payment of all local charges had been taken care of and they had $125,000 left, what would they do with it?

Same objection.

A. If they had no debts of any kind that were proper to be paid, they would keep it.

Q. Would they keep it here or send it to the United Gas Improvement Company?

Same objection.

A. Oh, I see what you mean now. They would send it to the United Gas Improvement Company.

Q. What would they do with it?

Same objection.

A. The treasurer of the Des Moines Gas Company has a bank account in Philadelphia in the name of the Des Moines Gas Company, and sometimes funds are transferred to that account, especially when the period is approached for the payment of interest on bonds or something of that sort. The money is payable at a Trust Company in Philadelphia, for interest on bonds. The practice of the treasurer is to accumulate in the Des Moines Company's bank account in Philadelphia——

Q. Mr. Lilley is the treasurer of the Des Moines Gas Company and he is the treasurer of the United Gas Improvement Company of Philadelphia?

Same objection.

A. Yes, sir.

At this time an adjournment was taken until 1:30 P. M.

2931 130 P. M., THURSDAY, *August* 24, 1911.

W. F. DOUTHIRT being continued on direct examination by Hon. H. W. Byers, testified as follows:

Duplicate copies of defendant's exhibits numbered 2, 9, 10, and 11 are marked and identified and these duplicate copies may be used by either party with the same force and effect as the originals and are to be considered in evidence as fully as the originals.

Q. Will you turn to page 171 I think it is in that minute book No. 2, stockholders' and directors' and tell me whether on that page there is anything there about pipe. I am not sure that is the book.

Same objection.

A. Yes, sir.

Q. I wish you would read those items, that is where it begins four inch pipe $31.40, six inch pipe $30.45.

Same objection.

A. Yes, sir.

Q. And 8 inch $30.45?

Same objection.

A. Yes, sir.

Q. Does that mean that was the price of that kind of pipe at that time?

Same objection.

A. I think the best I can do is to read the minute to you.

Q. I wondered if you know independent of that?

Same objection.

2932 A. No, I don't keep track of the price of pipe.

Q. Do you suppose you can tell either by reading that

entry or that meeting whether that represented the cost of that sized pipe at that time either here or somewhere else?

Same objection.

A. The best I can do is to read you the entry.
Q. Will you read it into the record?

Same objection.

A. Volume 2, stockholders' and directors' minutes Capital City Gas Light Company, directors' meeting of January 22d, 1906, contains the following, there is a heading here cast iron pipe, 1906 requirements. Then follows, approved action of officers in contracting with United States cast iron pipe and Foundry Co., for 60,000 feet, four inch cast iron pipe at $31.45 per ton and 20,000 feet six inch at $30.45 and 10,000 eight inch at $30.45 amounting to approximately $33,303.75.
Q. That probably meant laid down here didn't it?

Same objection.

A. I don't know.
Q. Is there any way you can tell that from the minutes?

Same objection.

A. No.
Q. You have no independent recollection about when you passed upon it if you did pass upon them?

Same objection.

A. No, I was not personally at that meeting and I have no recollection of that.
Q. I suppose these contracts probably are in existence so that we can get them and ascertain that fact or if you will have someone ascertain it for us.

2933 Same objection.

A. I have no doubt the contracts or documents bearing on the transaction are in existence.
Q. And will show whether that is the price laid down here or whether it was the price f. o. b. somewhere else?

Same objection.

A. I would think the contracts would show that.
Q. You didn't take the time or have anyone else take the time to make me up a statement covering the donations and contributions of the last four or five years?

Same objection.

A. I made some inquiries about that and learned or understood that the city's accountants had covered the matter very fully and I did not—it occurred to me perhaps you did not know that and when you did it would be unnecessary to duplicate the work.
Q. It must have be-n then the last day that the young man was here?

A. I don't know, I simply thought perhaps you did not know that and when you did know it you would not want to have unnecessary — performed so went no further.

Q. Now in going through the book there last night after court adjourned it seems that, if we can read the record right, that practically all donations and contributions and in fact the lodge dues in the different lodges of Mr. Haines are paid out of the operating expenses of the gas company, for instance, $500 to the Des Moines Club and $50 dues to some other organization all that class of personal expenses of Mr. Haines and contributions of that kind have been charged to the cost of making gas have they not?

Same objection.

2934 A. I would have to read the record to see what is there on that subject.

Q. Haven't you looked that over?

Same objection.

A. Not with that in view, I would be glad to do it if you liked.

Q. I have been assuming most of these minutes you either helped make them or wrote them up or approved of it afterwards?

Same objection.

A. That is true, but it is also true with a good many other companies and I have made no effort to carry these details in mind because they are always where I can refer to them.

Q. What is your judgment or personal opinion about the justness of that sort of a charge?

A. My judgment of course is that they are proper charges otherwise I would not have voted for them at directors' meetings which I no doubt have done as the records will disclose.

Q. What is the salary of the president of the Des Moines Gas Company now?

Same objection.

A. It appears by the—oh yes, I recall $10,000 a year.

Q. So there was some raise in it and you were mistaken yesterday in stating no change was made in his salary from manager to president?

Same objection.

A. No, I think not. I think his salary as manager was fixed at the same figure some months ago.

Q. When was it changed from $7,500

Same objection.

A. If you will let me have the records perhaps I can find it. Here it is at the meeting of February 27, 1911.

2935 Q. Up to January 1, 1911, Mr. Haines' salary was $7,500 was it not?

Same objection.

A. That is my recollection. The book you have before you will show.

Q. Well $625 a month?

Same objection.

A. That would be $7,500 a year, yes.

Q. And in February of this year it was increased $2,500, the increase to be effective from and after January 1, 1911.

Same objection.

A. Yes, that is my recollection, I see you are reading the record there.

Q. So that at the time then that Mr. Haines was elected president or about that time this change was made in his salary?

Same objection.

A. No, Mr. Haines was not elected president until July 1, 1911.

Q. So the raise was made before he was elected president?

Same objection.

A. Yes, sir.

Q. When that $2,500 was added to his salary to begin on the first of January did Mr. Bodine's $2,500 continue?

Same objection.

A. Yes, sir.

Q. Didn't make any change in that?

Same objection.

A. No.

Q. Now to get back to what I was trying to figure out, I don't find the exact item, but I will state it as I remember it the $500 fee to the club here in Des Moines, Mr. Haines' membership in a
2936 club not a public club in any sense, but a sort of a private club, is it your notion that a charge like that ought to be paid by the gas consumers and charged to operating expenses?

Same objection.

A. Let me see the record please.

Q. I told you I did not have it right there, I have lost the page but I know it is there.

A. Do you remember about the date?

Q. Well I think it is within a year or year and a half anyway. I can get another one there that will answer my purpose if you can't find that one. On page 192 here is a record like this authorize a donation of $1,000 towards the Young Men's Christian Association, $150,000 building, fund to be transferred from the unexpended balance of $2,000 approved as donation to the Methodist and Mercy hospital. Now is it your notion that a donation of that kind is proper to be charged to the cost of making gas to be paid by the consumers?

Same objection.

A. Yes, that is generally recognized in the classification of accounts by the—that is so generally recognized that it appears in the classification of accounts of the Wisconsin commission and the American Gas Institute.

Q. Of course that was not what I asked you, I simply wa-ted *yo* know your notion about it, your judgment about it and the reason that you have pursued that method. Now do you have the same notion about lodge dues and club fees and the personal expenses of your manager of that kind, is that proper to be charged to operating expenses?

Same objection.

A. I would put the matter of lodge dues and fees to clubs
2937 on rather a different basis but my notion as you express it would be the same.

Q. What different basis would you put it on?

Same objection.

A. This basis that one of the things that a public utility should strive to do is to create as far as possible a kindly feeling towards it on the part of the community and one of the means to that end is for its principal officer to meet and become acquainted with as many people in the community as is possible.

Q. To make himself popul-r?

Same objection.

A. And a means to that end is the joining of such organizations as you have mentioned.

Q. And I suppose one of the reasons is that that will give him a standing and popularity in the community as a manager.

Same objection.

A. The more friends a manager of a public utility can have the wider his acquaintance can be the better it is apt to be for the utility.

Q. And it was partly on that account he was given this extra $2,500 salary too I suppose and that is charged to the consumers in the cost of making gas?

Same objection.

A. No, he was given that extra $2500 salary because the directors thought he was earning it.

Q. Earning it how, by getting customers?

Same objection.

A. Earning it in the management of the property of which Dr. Marks has spoken so highly.

Q. You mean in getting business for the concern?

2938 Same objection.

A. No, everything that goes to good management. Good management consists in operating a property as economically as is consistne *tiwh* good results, giving the good service of which Dr. Marks Spoke and also in increasing business as much as can be eone along proper and legitimate lines.

Q. Well Dr. Marks was talking about his ability as a commercial manager more particularly wasn't he?

Same objection.

A. Yes, and he is also very efficient as an operating man. His early training was scientific and I think he would be regardee as a very efficient operating man aside from his abilities in a commercial di-ection.

Q. It is safe to say any way is it not that all of the contributions that have been authorized and appear upon Exhibit No. 27 for the last five years in the way of contributions to organizations in Des Moines, both charitable and others and such lodge dues and club fees as are authorized here were all chargee up to operating expenses and went into the cost of making gas?

Same objection.

A. Yes, sir.

Q. And all such items as this very recent one here that is found in your record signed by yourself, or rather signed with your name under date of June 26, 1911, an authorizee contribution of $200 a year to the convention fund of the Commercial Club of Des Moines, all such things as that would be charged to operating expenses.

Same objection.

A. Yes, the classification provides for that.

2939 Q. Now I wish you would take what the reporter has marked defendant's exhibit 28, containing ten typewritten pages written on but one side of the page and under date beginning with directors' meeting April 24, 1911, and covering directors' meeting of the Des Moines Gas Company May 22, 1911, June 26, 1911 July 10, 1911, and July 24, 1911, and state if you will what that exhibit contains in a general way a-d what it is, I don't mean to give the contents of it, but in a general way descriptive of it.

Same objection.

A. It contains the draft of minutes of the directors' meetings of the Des Moines Gas company held on the dates mentioned which have not yet been entered of record in the minute book.

Q. So that Exhibit 28 taken in connection with Exhibit 27, comprises all of the records of the me-tings of the stockholders of the Des Moines Gas company and the board of directors of the Des Moines Gas company from the begij-ing of its existence in March 1906 to and including the last meeting of the board of directors in July 1911.

Same objection.

A. July 24, 1911, yes, sir.

Q. I have the items here I could not find a moment ago and one of them is on page 172 of the book here under May 19, 1909, and is a $500 contribution to the Y. W. C. A. building and other is a subscription of $500 to some club during the first five years, do you know what club that refers to? That was Mr. Haines' personal membership in *th*the club here was it not?

Same objection.

A. Well I don't know what significance you attach to the adja-tive personal.

2940 Q. Well it was his membership, the U. G. I. or Des Moines Gas Company did not join the club, did it?

Same objection.

A. No, Mr. Haines did.

Q. It also covered his annual dues of $50 a year in addition to the $500?

Same objection.

A. Yes, I think it says there the 500 is to be paid during the period of the first five years, that would be a hundred dollars a year I suppose or at least might be spread over five years.

Q. Unless he paid it all at once, I suppose you don't know as to that?

Same objection.

A. Yes, I know in a general way.

Q. That he did not?

Same objection.

A. I think it has not all been paid yet, because I have talked to some of the gentlemen who are interested in building the club and I understand that the subscriptions are not all called in but I have not examined the books of the company to see about that.

Q. Now in this book defendant's exhibit 27 and Exhibit 28 wherever the entry is made authorizing the expenditure of money for some stated purpose by the Des Moines Gas Company, does that mean that sum of money referred to in the statements represents the estimated costs of the improvement or the actual cost?

Same objection.

A. Represents the estimated cost of material and labor.

Q. And after the work is completed and the exact cost ascertained then that item is carried on into the books and shows finally
2941 the exact cost does it not?

Same objection.

A. Books of account, yes.

Q. And reports are made to the treasurer of the United Gas Improvement Company who is also the treasurer of the Des Moines gas company showing the actual amount of money expended for these different things that are covered by the entries in these two exhibits?

Same objection.

A. No.

Q. In what respect am I in error in that question.

Same objection.

A. I think that no such reports are made to the treasurer.

Q. I notice all through the book here that the report to the Des Moines Gas company of expenditures are made by the treasurer of the company is that right?

Same objection.

A. Oh yes I see what you mean. You mean the betterment statements that are made up of the issues of bonds. Yes, sir.

Q. Well whatever they are made up for?

A. Yes, sir.

Q. These statements are based upon the actual cost of the improvements and betterments that have all theretofore been authorized.

Same objection.

A. Cost of material and labor.

Q. Yes, I meant cost of material and labor.

Same objection.

A. But the treasurer's statements to which you refer are prepared from statements sent to him from the books of account and not from any reports on completion of the work.

2942 Q. The trouble with my question was that in it I stated the reports were made to the treasurer, was that the objection to the question?

A. Yes, sir.

Q. Well I suppose reports are made to the treasurer, aren't they?

Same objection.

A. Not the sort of reports that are covered by the question.

Q. Reports of expenditures, aren't they made to the treasurer?

Same objection.

A. Well the expenditures are recorded in the books of account and then——

Q. You have at both ends so the treasurer there does not need a report made up from the records because he has, as I understand you a duplicate ledger there at Philadelphia?

Same objection.

A. Well, yes, it is a duplicate ledger, what we call a trial balance ledger so kept he can get from it the information necessary to make up these reports of betterment expenditures which he makes to the board.

Q. Under date of April 24, 1911, in the minutes of the meeting of the board of directors for that day on page 2 of Exhibit 28, I find this statement, approved authorizations for expenditures amounting to $25,423.26 as follows: Then follows the words street mains, length, size, street and then follows a large number of items beginning with 96 feet four inch-, day, name of the street, $70.04. While you are here I would like to have you explain to the Master just what is involved in that item 96 feet four inch main, $70.04. I have had that worked out here and it gives us 72.95 cents a foot.

Same objection.

2943 A. What was involved in that particular run of main I could not tell from what appears on the record.

Q. What I am trying to get at is, that it would not be either safe or proper to conclude from an entry of that kind that the cost of hat pipe alone was $70.04?

Same objection.

A. Cost of the pipe alone?
Q. Yes, unlaid.

Same objection.

A. Unlaid, oh no.
Q. That is what I am trying to get at just what it does cover in addition to the probable cost of the pipe?

Same objection.

A. Well it no doubt covers the cost of laying too.
Q. And specials if there are any?

Same objection.

A. Specials if there are any yes.
Q. And all of these other items of expenses like cartage, storage and that class of expenses?

Same objection.

A. Yes, I think it would include all of that. All of the expenses which may properly be called material and labor.
Q. In other words where these authorizations are shown through Exhibit 27 and Exhibit 28 and the amount authorized to be expended appears the amount is simply the estimated cost of the finished job.

Same objection.

The estimated cost of the material and labor necessary to finish the job.

Q. And that is true is it of the pipe that appears on Ex-
2944 hibit 28 under date June 26, 1911, where it says approved authorization for expenditures amounting to $11,074.60 and then under the heads of mains and size it shows 8 inch mains, that is shows some 8 inch mains, some 12 inch mains, some 2 and 3 inch, some 6, some 10 and some 20.

Same objection.

A. In the list which you have last mentioned which appears in the directors' meeting of June 26, 1911, you will note that some of the items are different, for example the item 450 feet 2 and 3 inch main on west Second street $30.00 does not mean cost of laying that main, but cost of barring over as indicated on the face of the record, which means to go over that stretch of main and drive a crow bar down occasionally to see if there are any leaks there. That does not mean laying main, could not lay 450 feet of main for $30.00. In the next item 2000 feet of four inch main on 38th street $200, that is marked there lowering, that means changing the grade or position of that run of main and the same thing applies to 850 feet of ten inch main on University street $625. That is not the cost of laying the main, that is the cost of lowering the main probably to conform to a changed grade of the street, something of that sort. Then here is another item 2,250 feet of 20 inch, four inch,

six inch and three inch on Mulberry street $115. That is simply barring for leaks over there.

Q. Now as to all the other items the question would be answered in the affirmative would it not?

Same objection.

A. I would think so, yes, sir.

Mr. BYERS: Defendant offers defendants' Exhibit 28 in evidence in connection with Exhibit 27.

2945 Exhibit 27 is the book heretofore referred to as the Des Moines Gas company No. 1 stockholders' and directors' minutes beginning with the entry under date of March 1, 1906 and ending with the entries under date of April 4, 1911.

Cross-examination by N. T. GUERNSEY, Esq.:

Q. Mr. Douthirt you sta-ted to explain why a 5 per cent bond of the Des Moines Gas company in 1906 although the company was not bonded for an amount that was large would not be worth par and you were interrupted. Will you complete that explanation?

A. Because many other elements or considerations besides the property security back of the bond enter into and influence its market value. One of the most important considerations is the rate of interest. Another is the length of time the bond has to run. Another is the provisions of the mortgage or deed of trust regarding future issue of bonds of the same authorized issue. Another is whether or not there are any prior liens. Another is the character of the property which is security for the mortgage and the use to which that property is devoted. Taking all of these things into consideration I was of the opinion and still am that the $285,000 bonds of the Des Moines Gas company at the time they were issued were not worth par in the market.

Q. In several questions that have related to these extraordinary expenses,—expenses extraordinary as they are classified here, General Byers has referred to lodge dues. Now as a matter of fact are there any lodge dues so far as you know included in these

2946 items?

A. Not so far as I know. I assume that General Byers was reading correctly from the record.

Mr. BYERS: I did not claim to read any lodge dues from the record.

Q. I find this in the classification of accounts of the American Gas Light Association, account D-4, expenses extraordinary, the heading, and following that "This account is intended to cover the cost of all donations and unusual expenses." I will ask you whether generally that these public service corporations in their management and operation such expenses as these which General Byers has referred to are incurred.

A. My experience is that they are.

Q. And they are also incurred by other business in other communities?

A. I think so.

Q. There has been reference here to donations to the Greater Des Moines Committee for instance. Those are donations such as are made by every prominent business concern in Des Moines are they not?

A. I presume so.

Q. And the same way with the Y. M. C. A., or Y. W. C. A. I guess this was?

A. I so understand.

Q. Including public service corporations and other business concerns?

A. That is my information.

Q. And in this classification I find that under the account which referree to D-5 expenses extraordinary, there are the following items indicating things to be charged to that account: "Annual dues to Board of Trade, stoves and other appliances donatec
2947 to churches or charitable organizations including insulation, subscriptions to public enterprises or entertainments, such as fairs, parades, public balls, etc., tickets for church and other benefits, unusual expenses." Now I wish you would state whether or not it is the practice of gas companies usually in the United States to charge these expenses extraordinary to this account as a part of their operating expenses.

A. It is. The classification you hold in your hand is evidence of that.

Q. That is this classification is the standard classification showing how they keep their accounts?

A. It is.

Q. I find in the Wisconsin classification an account headed miscellaneous general expenses and a direction to charge to this account "Subscriptions, donations and gratuity." Do you know whether the Wisconsin Commission recognizes expenses of this kind as a part of the legitimate operating expenses of public utilities?

A. It does and the classification published by the Commission from which you have just quoted is evidence of the fact.

Q. You were asked whether the minute books containee a truthful statement of who owned the stock of these two corporation-, and as I understood you said that the statement there might be correct and might not. How did you mean to be understood there?

A. I meant to be understood in this way that the minute books wou-d show a truthful statement of the stockholders as they appeared of record on the stock ledger of the company but might or might not show whether the persons in whose name the stock was record- were the beneficial owners of the stock. It is not unusual for stock to stand recorded in a name other than that of the
2948 beneficial owner. That was what I meant by that language.

Redirect examination by Hon. H. W. BYERS:

Q. Now Mr. Douthirt you did not understand me to claim that it was not usual for gas companies to charge these expenses to operating expenses or cost of gas, in fact that is just what we do claim, but I wondered if you know what you were talking about when

you said that practically all of the concerns of this town did that or whether you were just speaking general-y without knowing any specific case at all other than your own.

Same objection.

A. I have been told what other concerns of the town are doing and I accepted the statements made to me as true. I have not examined their books.

Q. Mr. Guernsey I suppose told you that was common in public service corporations?

Same objection.

A. No, I heard it from other sources besides Mr. Guernsey.

Q. And so it was on that sort of information that you say that it is common here in Des Moines?

A. Yes, I have heard that.

Q. I wanted to know whether it is common, I would like to know myself?

A. Yes, I have heard these statements made in a way in which I have no reason to question the accuracy and therefore accept them as true.

Recross-examination by N. T. GUERNSEY, Esq.:

Q. It appears that these things were authorized by the board of directors. Now is my assumption that before action by the
2949 board of directors this matter was submitted with recommendations one way or the other, correct?

A. It is.

Q. Now what is the fact as to whether the manager when he submitted these things to you in order to induce the board to approve them advisee the board that other like concerns in Des Moines and other business concerns in Des Moines generally were contributing to these objects or doing the same thing?

A. I have a very distinct recollection in that respect about one of the important contributions mentioned there. That is the subscription to the Greater Des Moines Committee. I remember—I have a decided impression that when the manager recommended that contribution to the board of directors he informed the board of a number of other contributions being made to the same committee and gave the names of some of the concerns making them.

Q. In the analysis of the accounts that has been introducee in evidence of the operating expenses, the actual amounts paid on these accounts will appear opposite the heading expenses extra, will it not?

A. In the classification of accounts followed by the Des Moines Gas Company which is the American Gas Light Association classification such payments would be charged to the account entitled expenses extraordinary as appears from the classification which has been quoted here this afternoon so that the account expenses extraordinary or as it is abbreviated in the exhibits expenses extra, would

show the amounts expended each year for all purchases under that account for all purposes mentioned in the classification would come under that account.

2950 Redirect examination by Hon. H. W. BYERS:

Q. Just one thing further while you are here, what is the capital of the United Gas Improvement Co.?

Same objection.

A. You mean the capital stock outstanding?
Q. Yes?

Same objection.

A. It is an odd amount and therefore I cannot give it to you exactly, but it is in the neighborhood of 55 millions.
Q. And can you give us without going into the details and without the names of each one the number of gas light companies in which it is interested?

Same objection.

A. I have never counted them general, I would have to go over the list and count them up.

Witness excused.

Here the further hearing of the case was adjourned until 9:30 a. m. Monday September 11, 1911.

2951 Monday Forenoon Session.

SEPTEMBER 11, 1911—at 9:30 a. m.

Counsel for the respective parties all present.
Testimony on part of Defendants resumed as follows:

GEORGE D. DOBSON, sworn on part of defendants, examined by R. L. Brennan, Esq., testified:

Q. Where is your residence?
A. In Des Moines.
Q. How long have you lived in Des Moines?
A. Since 1892, practically all the time, with the exception of a few intervals when I have been out of the city on engineering work or in obtaining my education.
Q. What is your profession?
A. Civil engineer.
Q. How long have you been practicing your profession?
A. About eight or nine years.
Q. Are you a graduate of any school?
A. I am; of the engineering department of Cornell College.
Q. When were you graduated?
A. In the spring of 1903.
Q. Have you practiced your profession in and about the city of Des Moines since that time?
A. Most of the time.

Q. Have you held any official position in the city, and if so, tell the Master what position you have held.

A. I have. At the present time I am in charge of the bridge work of the city, bridge engineer; and for two years, from 1906 to 1908, I believe are the dates, I was City Engineer. Previous to
2952 that time I was employed in various positions in the city engineer's department.

Q. Was that work such that you came in contact with street construction to any extent?

A. It was.

Q. Tell the Master in a general way what experience you gained in that direction prior to the time you became city engineer in the city of Des Moines?

A. The major portion of the work prior to the time I became city engineer was not directly concerned in the street improvements of the city. The major portion of it perhaps was of concrete construction—bridge and culvert, and the street work was the smaller portion of that work. After I became city engineer I of course had full charge of the preparation of plans and specifications for all public improvements which the city of Des Moines had to make, and in a general way had charge of all the improvements made in the streets of the city.

Q. And the improvements to which you refer included sewers, paving, curbing and public improvements of that character?

A. Yes.

Q. Now, from 1906 until 1908, during your term of office as city engineer, did the city to any extent improve its streets?

A. Yes, there was fully an average amount of public improvements if not more than the average at that time.

Q. Were any of the principal streets of the city improved during that period, if so, tell us what streets were improved?

A. As I recall it we paved West Locust Street from Second street to about Ninth street with creosote wood blocks.

Q. On what kind of foundation?

A. On concrete foundation; that is to say, we did not re-
2953 move the old foundation which existed; that consisted of natural cement. We cleaned that off and resurfaced it with Portland concrete to bring it to a true grade and laid the new work on the new surfaced foundation. We paved portions of Walnut Street, as I recall, from Eighth to Tenth or Ninth to Eleventh, about two blocks, at the upper end of the business district, and resurfaced what had been brick pavement with asphalt, bringing it up to grade in the same manner I have referred to in reference to the creosote wood block. We paved Court Avenue from the river to the county court house with brick block, resurfacing the old natural cement concrete base and in some places a macadam base with Portland cement concrete, and laying on top of that the brick block pavement with Portland cement filler. We also paved East Walnut Street with the same class of pavement from the river to East Fourth or Fifth Street, as I recall; and Second Street, I believe, in East Des

Moines from Grand Avenue north for several blocks; and Des Moines Street from about First street to Third or Fourth with brick block pavement. That was all new work on a Portland cement concrete base, as I recall it. We paved Kingman Boulevard, I believe, from Twenty-fourth Street to Park Lane, which corresponds with about Forty-seventh Street with Asphalt pavement. We paved Ascension street from Fourth street to Sixth street with tar macadam.

Q. Tar macadam laid on what kind of foundation?

A. Cinders; that is to say, the construction consisted of six inches of cinders, four inches of coarse crushed stone and two inches of wearing surface or binder stone, mixed with tar.

Q. Was any portion of Woodland Avenue paved during your administration?

A. We paved, as I recall it, Woodland Avenue from the east entrance of the cemetery west to Twenty-eighth or Twenty-
2954 ninth streets, though I am not positive in regard to that. I know we had made certain improvements on the street preparatory to paving, such as curbing and grading, but I would not be positive that we had actually laid the paving on that street.

Q. Now with regard to the curbing and guttering of streets in the city during the time you have been connected with the city, what has been the character of the material which has been used in the construction of curbs and gutters?

A. The curbs and gutters have been constructed of Portland cement concrete altogether, so far as I recall. Some were laid on a gravel foundation and some of them were setting directly on the natural soil.

Q. Have you used to any extent what is termed as a combination curb and gutter?

A. Yes, that is used a good deal.

Q. That consists of concrete, does it not?

A. That is of concrete, sometimes surfaced on the top of the gutter with a richer mixture, and sometimes it is all built of the same mixture.

Q. What is the proportion?

A. For one course mixture it is one part cement to three parts of sand and gravel. If they use two course work they generally use about one of cement and four of gravel, with a one to two or two and a half face, but that sometimes varies, depending on conditions.

Q. You are familiar with the specifications for a concrete base for street improvements, are you, in the city of Des Moines?

A. Yes, I am in a general way familiar with the concrete specifications on the base of pavements.

Q. What is the thickness of the concrete base that is ordi-
2955 narily used and usually used in the City of Des Moines for street improvements on the principal business streets?

A. Six inches is the ordinary thickness of base for new work on our business streets.

Q. And in the residence sections of the city?

A. At the present time five inches is considered standard thickness for the residence streets.

Q. How long has the five inch concrete base been used in the residence section of the city?

A. Probably not over four years. It may have been used to a certain extent before that, but for a great many years six inches was the universal standard in both residence and business districts.

Q. What proportions are used in making a concrete base?

A. For Portland cement, one portion of cement, three parts of sand and six parts of crushed stone; or one part of cement and six parts of properly graded gravel and sand mixed—what is sometimes called concrete mixture, which is obtained from the sand pumps at the river.

Q. In what manner is a street brought to grade, is that done usually by the public or the contractor who has the contract for the pavement or is it done by the city?

A. The city does the preliminary grading, putting the street approximately to grade with the finished pavement. It is then turned over to the contractor and he removes the same amount of dirt that is replaced with the pavement; that is to say, the pavement displaces a certain amount of dirt, and that is the dirt the contractor removes.

Q. Have you had experience in grading streets and constructing excavations and things of that sort?

A. Yes, I have had engineering charge of those details.

2956 Q. How extensive have the improvements been during your connection with the city with respect to sewer construction?

A. We built, I believe, about 20 or 30 miles of sewer while I was city engineer.

Q. And in what portions of the city were those sewers constructed?

A. There was a very large system built in Grand View, which is the northeast portion of the city. That was I believe a system of four or five miles; I couldn't recall the exact length, because it has been quite a number of years since we built it and those figures are given from memory, without having refreshed my memory recently. We also built what is called the northwest sewer system, lying in the northern part, in University Place.

Q. The Grand View system to which you have referred is that in the northeast section of the city?

A. Yes, sir.

Q. In the vicinity of Union Park?

A. Yes, it lies principally east and north of Union Park.

Q. The last system you mentioned is in the northwest portion of the city?

A. The northwest sewer system lies principally north of University Avenue and west of Twenty-fourth Street. There was one or two extensions to the Ingersoll run sewer system, including the district, as I recall, west of Thirty-first street and between Ingersoll run and University Avenue, some of it extending as far west as Pack Lane, I believe, on Kingman Boulevard; and the center Boulevard sewer system lying south of Grand Avenue in the vicinity, as I recall

it, between Thirty-fifth and Thirty-sixth and Forty-second Street; I don't recall the exact boundaries now.

Q. Do the systems which you have described include the
2957 laterals which were constructed?

A. Yes, they include, as far as we were able to do so, all the principal laterals that would be demanded on those systems, in order to spread the cost of the main trunk of sewers over the district to which it belonged.

Q. To what depth do you ordinarily go in constructing a sewer?

A. That varies from a few feet—just enough to cover the sewer to protect it from travel and frost—four or five feet, down to 22 and 23 feet. Of course that is an extraordinary depth, and is merely at points where we cross a ridge. Generally where a street has not been brought to grade there will be some deep cutting and shallow filling. But the ordinary depth might be safe to place at 8 to 10 feet on the laterals. The trunk sewers would probably range two or three feet deeper. The contractors who had the northwest sewer system and the center boulevard sewer system and the extension of the Ingersoll run sewer system, used machines, ditching machines, which would cut to a depth of 20 feet, and as wide as five or six feet, if necessary. The rest of the sewers were built at that time, I believe, with hand work.

Q. Were they constructed of pipe or brick?

A. The principal portion of the systems were vitrified pipe, and some small portions of the Ingersoll run extension was reinforced concrete. I do not recall that we built any brick sewers.

Q. What is the reinforced concrete reinforced with?

A. Steel bars. The type designed was similar to a box culvert, approximately square and had a flat slab roof and flat sides, and the invert with the depression in the center so as to hold the minimum flow in the center in dry seasons. Of course they flay slab roof and flat sides had to be reinforced with steel to give them strength.

2958 The MASTER: Are vitrified pipe made of the same material vitrified brick are?

A. Quite similar. I never got into the chemistry of either brick or pipe manufacture, but the shale is to a great extent similar and the- manufacture pipe and brick from the same shale pits here.

The MASTER: They are manufactured here?

A. Yes, there are several factories in the city.

Q. The Iowa Pipe & Tile Company is one of the concerns which manufactures sewer pipe?

A. Yes.

Q. And the Flint Brick Company, do they manufacture any tile or pipe?

A. As to that I am not positive, I do not recall that they do.

Q. Have you made observations, Mr. Dobson, with respect to the character of the soil and soil formations in the city of Des Moines?

A. Yes, in a general way I had to familiarize myself with the classes of soil and the character of soil in different portions of the

city in which we expected to make sewer improvements, both before the sewers were built and during the construction of these sewers.

Q. I wish you would describe in a general way the character of the soil in and about the city of Des Moines where sewers have been constructed or other public improvements have been constructed.

A. The soil in the down town district in West Des Moines is principally of a sandy and gravelly composition, indicating that it is river washed material. Apparently this bottom was subject to overflow and washing from the river. We *winf* the sand and gravel at various depths, ranging from almost the surface down to several feet in depth in the business districts of West Des Moines. The soil in the business district of the east portion of the city has a
2959 great amount of sand in it, but it seems to be of a finer character and has more silt mixed in with it. It is a class of material that will stand in a trench with less shoring than the materials in west Des Moines. The material in West Des Moines in the business district requires tight sheathing in a large portion of the district. In the residence portion of the city, the west and northwest, the material is more of a clay, except for the top soil of three or four feet. That is of a first class nature for trenching, except in rare cases where we get what we call sea mud at quite a depth. For instance on Twenty-third street from Cottage Grove south we had a deep sewer, 18 to 20 feet deep, and had a great deal of trouble there with sea mud, which has very little stability.

Q. At what depth was that encountered?

A. I believe we encountered that at a depth of 16 to 18 feet. I do not recall of ever encountering that character of material close to the surface, unless there was some along Ingersoll run in small spots. The district in Grand View or northeast Des Moines is more of a sandy nature; some considerable portions of clay, but there is a great deal of sandy soil there, with spots of quick sand, that according to my recollection ranges from five to ten or twelve feet in depth. These beds are very irregular, running very often in very small pockets; that is to say, a pocket of quick sand may only extend a rod along the line of the trench, and you may encounter it for two or three hundred feet.

Q. And at what depth below the surface do you find it?

A. I don't recall ever*y* finding it any closer than five or six feet from the surface. Most of it that I do recall seemed to be at a depth of ten feet or more.

The MASTER: Is the clay hard pan or joint clay?

2960 A. I don't recall ever finding any hard pan. Most of the clay is yellow clay, easily handled with a spade. We find other colored clays at a greater depth—blue clay and some white clay. It all seems to be most easily handled with an Italian spade. On the south side of the river, take for instance south Ninth Street, I believe there is a harder formation of clay, ranging into shale. I don't recall the depth at which you find the shale along south Ninth, but I know it is very close to the surface in spots south of the river. That is true also with certain places in north Des Moines along the

edges of the bluffs, say in the vicinity of Sixth Avenue bridge. You will also find some shale along the vicinity of Arlington Avenue and State Street. High*ahlu* Park has principally clay on top of the hill, and down on the bottoms it is sand and gravel, very similar to the west Des Moines business district, being river washed or first and second bottom of the river.

Q. Now, you spoke of the character of the soil in the business section of west Des Moines being such that it required shoring or sheathing in constructing trenches?

A. Yes.

Q. To what depth do you ordinarily go before you are required to use sheathing or shoring?

A. That of course depends on the character of the soil. If y u strike the sand and gravel right at the surface in one of these down town business streets, it would probably be advisable to close sheathe from the surface down for a trench more than two or three feet in depth, because you would be subject to inundation from heavy rains and it might cause the trench to cave. So that it is hard to state just what percentage of the down town district would have to be tight sheathed and what would not. For instance, when we
2961 built the West Locust storm water sewer from the river to Ninth street, as I recall, probably two-thirds of that was tight sheat-ed work that went to a depth of ten to fourteen feet. Of course, it being a deep trench, it would not do to take the chances that we would take in a shallower trench.

Q. Have you seen gas pipes being placed in the ground in the city of Des Moines at different points and different times?

A. Yes.

Q. Do you know what their practice is with respect to sheathing or shoring?

A. Yes, in a general way.

Q. To what extent *to* they use sheathing and shoring?

A. Well, I do not recall now seeing them lay any gas mains in the business district recently. I have seen them lay gas mains in the suburban districts quite a number of times without any shoring at all, and their practice would not be materially different from that in a shallow sewer. It is a question of the judgment of the foreman as to whether the material they are going through will stand for one or two days or whatever length of time it is necessary to have the trench open, and each particular class of soil is to be sized up by the foreman in charge.

Q. I was asking about your personal observation.

A. That is my observation; their practice does not materially differ from our shallow sewer practice.

Q. Is there any substantial difference in the depth of the trench for a gas main or water main?

A. According to my observations the water mains are laid somewhat deeper than the gas mains; perhaps one or two feet. However, as to that I am not accurately informed as to the exact depth.

Q. Have you seen gas mains repaired or replaced in the
2962 business section, and if so, what is the character of the trench used for the purpose of making repairs and replacements?

A. I cannot at this instance recall seeing any gas main trenches in the business district.

Q. Have you seen any water mains repaired or replaced in the business section?

A. Yes, I have seen water mains repaired on account of broken mains, but I do not recall any great amount of general water main work in the business district.

Q. Do you recall anything with regard to the trenches that were made for the purpose of making these repairs?

A. Whenever there was a broken water main, the soil naturally was saturated with water, making the condition not at all ordinary so that the trench almost invariably had to be sheathed.

Q. Now, Mr. Dobson, I want to ask you about rock formations. Do you know of any in the city of Des Moines which would be encountered to a depth of from three to six feet?

A. I don't recall of encountering any rock or shale, which is sometimes classed as rock, at such depth in our sewer work.

Q. You have encountered rock in your sewer work?

A. Yes.

Q. At what depth?

A. As I recall it, we found rock or shale on Sixth street and Arlington Avenue in the vicinity of the Sixth Avenue bridge at a depth of from 10 to 12 feet, though I would not be positive as to that depth.

Q. Now, I want you to give the Master some notion of the cost of paving streets in the city of Des Moines—take for instance brick block laid upon five or six inch concrete?

Objected to on part of complainant as being immaterial,
2963 because the cost of paving streets the way it is ordinarily done is not a fair criterion to the cost of repairing paving over mains.

A. The cost of brick pavement for the last year or two in Des Moines had ranged in the neighborhood of two dollars,—rather above two dollars perhaps than below.

Q. That is two dollars per square yard?

A. Yes.

Q. What does that include?

A. That includes all the grading necessary, to remove the dirt from the finished grade of the pavement down to the subgrade, smoothing off, leveling, rolling and laying the concrete base, furnishing and spreading the sand cushion, furnishing and laying the brick wearing surface——

The MASTER: What depth of sand cushion do you use?

A. Generally two inches. And furnishing and laying brick wearing surface and pouring the pitch or cement or sand filler, cleaning up and removing all rubbish.

Q. And furnishing all materials and labor for that work?

A. Yes.

Q. Does that include the contractor's profit?

A. That includes the contractor's profit and such discounts as are

necessary in cashing improvement certificat-on by the contractor as pay for the work.

The MASTER: Does that apply to all kinds of paving?

A. Yes, all of our street improvements in the city of Des Moines are assessed to the abutting property and that cost is spread over a period of six or seven years.

Q. The MASTER: Does that include asphalt and brick?

A. You mean the price?

2964 The MASTER: Yes.

Mr. BRENNAN: I was asking about brick first.

A. The price is for brick alone on a concrete base. We have not been doing a great deal of brick paving in Des Moines this year. It has been mostly small contracts, two or three thousand yards, small jobs here and there, an alley paved, and things like that, where the size of the contract is not very large.

Q. Do you lay any brick on said foundations in the city?

A. Yes, there has been what we call two course work, on a four inch sand bed, with the old style paving brick, which is very similar in size to building brick, laid flat, and then two inches of sand cushion on top of that, and a wearing surface of paving brick laid on edge, and generaly a sand filler swept into the interstices between the brick, but that is practically abandoned now.

Q. Can you tell the Master about how many streets or portions of the city is represented by pavement of that character?

A. Well, it would be a little difficult to say off-hand. There is quite a little bit of that. That was one of the earlier type of brick pavement. Where the traffic has not been too severe and the foundation good those pavements are still in existence. Take for instance Arlington Avenue, in North Des Moines, is still in a pretty fair state of preservation. That was laid I suppose fifteen year ago. There are quite a number of streets of that character.

Q. Now, you spoke of creosote wood blocks laid on concrete base. Have we considerable pavement of that character?

A. Yes, there is a large amount of creosote wood blocks on concrete base in the business district.

Q. West Locust Street, for instance?

2965 A. West Locust Street is paved with that character of material, and East Locust, from West Twelfth, I believe, to East Sixteenth, it is paved with creosote wood blocks.

Q. Are those blocks laid upon a six inch base or a five inch base?

A. Those blocks are laid on a base varying in thickness probably more than six inches in average depth, because the original pavement consisted of brick was about four inches thick and two inches of a sand cushion and about six inches of natural cement concrete. The creosote blocks mostly are three and a half inches thick and they are laid on a sand cushion of about one inch thick; so that it was necessary to bring the old concrete base to a higher grade in order to leave the finished grade of the street at approximately the same grade as the old brick pavement, the difference being two to two and a half inches on an average of concrete on the top of the old base.

Q. I wish you would tell the Master what the city has paid for pav-

ing of that character, for the workmanship and material, including all the items, contractor's profits, etc.

A. For a brand new pavement on a concrete base where the contractor prepares the street grade by removing the dirt, the price has ranged as I recall it from $2.80 per square yard to about $2.90 and possibly as high as $3. We have not done a great deal of creosote block work on new foundations. The creosote block on the old foundation, resurfacing the old foundation, ranges around, I believe, $2.25; that is my recollection.

The MASTER: On the new foundation?

A. On the old foundation.

Q. What other streets have you in the city that you recall aside from Locust Street that are paved by creosote blocks?

A. Sixth Avenue from the Union Depot north to Grand
2966 Avenue, I believe, is paved with creosote wood block. Fifth Street from the Union depot north to Grand Avenue I believe is paved with the same material. West Eighth Street I believe has quite a bit of creosote wood block in the business district. The Sixth Avenue bridge, which is a concrete bridge with an earth fill, is paved with creosote wood blocks, and the north approach of that bridge is also paved for a distance of about a thousand feet with creosote wood block.

Q. That is also true with the East Locust Street bridge?

A. Yes. I don't recall any more now.

Q. Now, going to the pavement consisting of asphalt laid upon a concrete base with a two or three inch binder, whatever is used, tell the Master what the contract price for that class of pavement has been?

A. That has ranged from $1.58 per square yard up to $2.15 cents per square yard I believe. The price where it has ranged over $2 has not been under competitive bidding. Up to the time that the Mayer Brothers Construction Company came into the city and began bidding on our work within the last year, has generally ranged around $2 with only one paving concern bidding on the work practically all the time. Since competition was introduced the price has dropped until it is down to $1.58 per square yard at the present time.

Q. What does that $1.58 include?

A. That includes all materials, labor and expenses necessary in the construction of asphalt pavement. As I recall it that price of $1.58 was bid on two streets recently with a one inch binder and a one and a half inch wearing surface and a five inch Portland cement concrete base. That is a residence district class of pavement.

2967 *Q.* The MASTER: The concrete base is broken rock and cement?

A. Yes, ordinary concrete, either crushed stone or sand and gravel mixed with cement in proportion to one-sixth of cement and the rest sand a gravel or sand and rock. That is mixed in a mixing machine the same as any other concrete and then spread out on the ground.

Q. The practice in Des Moines with regard to intersections has

been to consider them a part of the street improvement and assess the cost thereof to the abutting property?

A. Yes, the practice in Des Moines has been to assume the entire cost of the pavement of any one street to the abutting property along that street, including intersections, streets and alleys, inspection, clerical work, official advertisement, etc.

Q. Back 150 feet from the line of the work?

A. Yes.

Q. Except where otherwise waived by the property owners?

A. Yes.

Q. I take it that the prices which you have given the Master covering the cost of construction of pavements does not include inspector's fees and these incidentals you have mentioned?

A. No, it does not.

Q. These inspectors are in the work representing the city to see that the contract is performed?

A. Yes.

Q. They are not employed by the contractor in any sense?

A. No.

Q. And the clerical work to which you refer means the work necessary in the city clerk's office and engineer's office?

A. Yes, the preparation of the plans and the assessment schedules and other incidental clerical work.

2968 Q. I will ask you what the fact is as to the manner of paying contractors, whether they are paid in cash or whether the contractor is usually paid in assessment certificates?

A. It is practically all improvement certificates. Of course, some of the property owners pay cash, preferring to pay cash instead of letting it run at a six per cent rate of interest.

Q. I mean in the first instance, as between the city, and the contractor, what is the fact as to the manner in which payments are provided?

A. Paving certificates against the abutting property.

Q. You spoke of discounts. I would like to have you explain to the Master just what you meant by that?

A. The general contractor does not carry sufficient capitalization to be able to carry these improvement certificates until they mature, and so he must go to a banker or some investment company and sell them for what he can realize on them in order to go on with the additional work. That discount in Des Moines runs from two to three cents on the dollar ordinarily, according to the best information which I have available.

Q. And that is considered by the successful bidder in making his bids?

A. Yes.

Q. Have you familiarized yourself with the unit prices of materials and labor in the city of Des Moines in connection with street improvements or in connection with public buildings?

A. Yes, in a general way I am familiar with the unit prices of material and labor.

Q. Are you acquainted with the unit prices for excavations in the city, say trenches three to five feet in depth?

A. Yes.

2969 Q. And what would you say, Mr. Dobson, would represent the reasonable price per cubic yard for constructing trenches of the character to which I have called your attention?

A. That would range in the vicinity of 25 to 30 cents per cubic yard with the material removed, where there was no shoring to amount to anything.

Q. I want you to keep in mind a trench sufficiently wide to permit a six inch gas main or a three or eight inch gas main.

A. As I recall the width of trenches which are used in work of that character, 18 inches would be about the minimum width for a man to work conveniently in a trench of five feet deep and 18 inches wide. The cost of removing the dirt would be about seven cents per lineal foot according to my estimates.

Q. It would be how much?

A. Seven cents per lineal foot for a trench of 18 inches wide and five feet deep. The cost of trenching varies in the soil almost directly with the amount of dirt removed down to a depth of about five feet. If you go any deeper than that, the cost will increase and a straight yard basis is ordinarily a fair basis for estimating a trench from three to five feet in depth.

Q. As you go below five feet it involves additional labor?

A. Yes, the size of the spoil bank along the trench becomes so great that it has to be handled twice to keep it from getting back into the trench.

The MASTER: How much did you say per foot?

A. Seven cents per lineal foot. 25 to 30 cents per cubic yard. The back filling of a trench like that is very rapid and ordinarily in our sewer work is being done with a horse and scraper of some form, the horse being on one side of the trench and the scraper on the other, working back and forth. Of course if it

2970 is in a paved street the material has to be put in slower and tamped to prevent the pavement from settling, or flushed with water, and the trench either left open or the pavement merely put in temporarily, and then after the trench has settled completely, the pavement is relaid permanently.

Q. What do you estimate the price of the back filling to be?

A. I don't recall now that I have ever kept any data of the back filling of paved streets where it is tamped carefully from the bottom of the trench up. My recollection in regard to that filling, where it is put in by scraper and then flushed, is about ten cents per cubic yard.

The MASTER: Where there is no pavement?

A. Yes, on streets where no pavement are to be replaced.

Q. Now, if you had to have a trench some wider than that, what would be the increase in proportion to the width?

A. That would increase almost directly with the amount of dirt removed.

Q. Are you familiar with the prices of material used in concrete work?

A. I am.

Q. I wish you would tell the Master what the range of price is for work of that kind?

A. The price of material?

Q. Yes.

A. The cement on board cars in Des Moines at the present time is selling for about $1.13 per barrel. I believe it has been bought lower than that by some contractors, and some perhaps are paying a little bit more than that, depending upon their ability as
2971 purchasing men. The price of sand is about 35 cents per cubic yard, I believe, if you buy it from the sand pumps.

The MASTER: Where is that at?

A. Along the river. There is an abundance of sand and gravel to be obtained at the present time by driving the wagons directly into the river and loading it up and it has been so all the time for the last two years. For instance at the Walnut Street bridge they have been buying sand and gravel mixed as it lays in the bars along the river, for from 50 to 65 cents per cubic yard. The screened gravel from which the sand has been mostly separated sells for about 80 cents per cubic yard at the sand pumps. Crushed stone brings about $1.35 per cubic yard on board cars in the city. The cost of getting those materials to the paving depends on the location of the paving in the various portions of the city and the distance from the track or from the river where the material is obtained to the location of the paving.

Q. Now, in doing repair work, or for instance you are going to remove the pavement for the purpose of laying the pipe in the streets, can you use any of the material in replacing the pavement?

A. Yes, it is commonly done. For instance, in removing the concrete base it is shattered so that it is practically reduced to its original size, not entirely, but to a great extent. If proper care is taken in depositing that along the side of the trench so that it does not become mixed with the dirt there is no reason why that material cannot be used again and mixed with fresh cement and as much sand as is necessary to fill the voids and make the concrete base of the same material. The brick pavement has a great
2972 deal of salvage in it, the wearing surface, depending on the character of the cementing material or filler that was put in the original paving. Two course brick work you might say is practically all salvage—the sand cushion the sand base and brick. There is no reason at all why any material amount of new materials will have to be brought on the job for replacing two course brick pavement. The tar filled brick pavement would have less salvage, depending on the time of year that the paving is removed. When the tar is cold it has a very tenacious grip or cementing quality and there is quite often a very material breakage in removing the brick. If the pavement is lifted during the warm weather when the tar is soft, there is very little damage done. With the cement filler there is quite often a heavy loss of material and in replacing

the wearing surface it is quite often necessary to bring new material on to the job.

Q. By the way, what is the constitutent element of this cement filler?

A. The ordinary mixture is one part of Portland cement to one part of finely screened sand, so that it will fill the interstices between the brick.

The MASTER: That makes a very hard cement?

A. Yes, that should under proper conditions make a very hard cementing material and when first class work has been done those joints should wear very nearly as good as vitrified brick. As a matter of actual practice there are a good many conditions which enter into the obtaining of a successful piece of work. A good many of our cement filled streets have not come up to the expectations.

The MASTER: It is not due to the ignorance of the contractor?

A. Sometimes it might be laid to the intent of the con-
2973 tractor or carelessness of the inspector, and sometimes unfor-seen climatic conditions—a very severe rain in the evening after the work is completed may wash out a material portion of the cement filler, or if the brick are very dry and hot and this cement filler is poured, it might sap the life out of the cement, absorbing too much of the moisture.

Q. I want you to tell what other salvage might be used.

A. In creosote block paving, with careful lifting of the pavement the major portion of the wearing surface should be salvage. That varies also with the time of the year in which the pavement is lifted, the strength of the tar and binder having a great deal of effect on the ease with which we get the blocks out whole.

The MASTER: Do you fill them again with tar?

A. Yes. Asphalt pavement, the wearing surface can be mixed again with new material and relaid again. The binder is probably all lost; you might say it is all wasted; you will have to use a new binder.

The MASTER: What do you mean by binder?

A. Asphalt pavement as laid in Des Moines consists of three courses; the concrete base, composed of Portland cement, sand and gravel, and a binder course about one inch thick, of small crushed stone or gravel mixed with asphalt—sometimes called asphalt concrete—then on top of that is the wearing surface of sand and Portland cement mixed with asphalt and rolled out. The bonder course has to be spread and rolled before the wearing surface is put on. It is the intent of the binder to bind the wearing surface to the base and give it a better grip or bond, more stability, so that it won't become wavy under traffic and disintegrate in that way.

The MASTER: You say the bonder would be destroyed?

2974 A. It is very likely there would be very little salvage to the binder. It is so thin a layer and the cost of it is much less, and the trouble and labor of trying to separate it from the wearing surface and keeping it clean and gathering it up would probably off-set the value of it.

The MASTER: How about the top?

A. The top is generally removed in larger sheets. The value of the wearing surface is such that you can afford to spend some time on it in mixing new material with it on account of the value of the material in it. It possibly might be done on the bonder, although it is a question in my mind whether there would be any material saving.

Q. Would it be practical in a case of that kind where you are lifting a strip of pavement three or four feet in width to have your equipment on the ground to take care of the wearing surface and protect the salvage?

A. I believe there is a form of street machine that is sometimes used for that purpose. We never used it in Des Moines. My only knowledge of that is from reports of other people in regard to that. I can see no reason why it would not be feasible to do that. I know in laying pavement now it is quite often mixed at the plant and shipped possibly from one town to another and then heated in pans or machines along the line of work to the proper temperature and then spread and raked out and rolled.

Q. Mr. Dobson, in that connection I wish you would tell the Master who are some of the principal paving contractors in the city of Des Moines, or who have performed work of that kind in the past.

A. The principal asphalt contractors are the Bryant-McLaughlin Construction Company with headquarters, I believe, at
2975 Waterloo. They maintain a branch office here. The Mayer Brothers of Erie, Pa., I believe, is their home office, have a branch office here. These are the only two firms bidding on asphalt work in Des Moines at the present time. As to the creosote block work there is O. P. Herrick, who has laid some of the pavement. He is a Des Moines contractor. Jack Campbell laid quite a bit of it, and James Horrabin has laid considerable pavement here I believe.

Q. Is the Christie Construction Company engaged in that class of work?

A. The Christie Construction Company does principally concrete work. I do not recall whether they have laid any creosote block pavement in Des Moines. There may be others who have laid creosote blocks here, but I do not recall at the present time.

Q. There is a firm at Minneapolis that has done some?

A. Yes, the Republic Creosoting Company of Minneapolis and the Kettle River Quarries Company. In the brick paving line there are the J. W. Turner Improvement Company, J. L. Hansman, O. P. Herrick, James Horrabin, Jack Campbell, George King and the Cook Construction Company.

Q. I will ask you if Charles Weitz Sons Company has to your knowledge and experience in the city of Des Moines constructed any pavement for the city?

A. I never heard of them as paving contractors.

Q. Do you know of J. C. Mardis contracting any public improvement of that nature?

A. Not under my supervision or experience, so far as I recall.

Q. Mardis and Weitz Company are engaged in building construction, are they not?

A. Yes, I understood they confined themselves entirely to
2976 general building construction.

Q. Are you familiar, Mr. Dobson, with the price or cost rather per cubic yard of concrete, say for foundation work?

A. Yes.

Q. In a general way, tell the Master what in your judgment would be the reasonable cost per cubic foot of concrete used in buildings for foundation work and also in street pavement?

A. If you take crushed stone for your aggregate, the price of stone on board of cars, as I stated will be, $1.35 per cubic yard, and taking into account wastage and shrinkage it will take almost a yard of crushed stone for every yard of concrete. We will say for instance where the mixture of sand is 50 per cent of the bulk or crushed stone, or say 1-2 ½-5, or 1-3-6, or 1-2-4. So that if you have to haul crushed stone from the car to your building site by wagon, say a half mile, it will cost you about 30 cents a cubic yard to get it delivered at the spot where you want to use it. That will bring the cost of the stone up to $1.65 per cubic yard. Under present conditions you can get sand & gravel delivered within a half mile of the river for 50 and 65 cents per cubic yard—we will say 65 cents at the outside figure—use a half a yard of that for a yard of concrete, allow 33 cents for the sand in the yard of concrete; the amount of cement varies of course with the mixture. A 1-3-6 mixture will take about 1.1 barrels of cement and a 1-2 ½-5 mixture, which would be as rich as there would be any excuse for making any kind of building foundation, would require about 1¼ barrels cement. That cement is being purchased for as low as $1.08 cents per barrel. But we will say it costs $1.15 and if you haul it a half a mile it will take about five cents a barrel to deliver that and that would bring the
2977 price of cement to $1.20 delivered at the job, the cost of mixing and placing varies widely with the efficiency of the foreman in charge and the conditions under which he is laboring. It has been mixed and placed in foundations, building foundations, that is, under conditions similar to building foundations for 50 cents per cubic yard; but if I were going to estimate the cost of foundations I believe I would allow a dollar a cubic yard for mixing and placing to allow for unexpected difficulties.

Q. Then what would be the aggregate of your estimate?

A. So that you would have as an aggregate $1 for the mixing and placing, and for the mixture of 1-2 ½-5 you would have a barrel and a quarter of cement at $1.20; that would be $1.50 for cement and the sand would cost 33 cents; the crushed stone would cost you $1.65, making a total cost of $4.48 for the material in place under ordinary conditions. It would cost you far less than that if you just had to dump it into an open trench without forms.

Q. Does this $4.48 include the use of forms?

A. That would include the ordinary range of conditions, sometimes with forms and sometimes without. As I stated the cost of

mixing and placing at $1 a yard allows a very large percentage to cover anything like the cost of placing forms. Of course the forms on foundations are of the crudest and roughest character.

Q. If your buildings under construction were located in close proximity to railroads and sidings, would the unit price be limited on account of that?

A. Yes. For instance, if you had a railroad spur or siding in the same block with your building, we will say erecting a build-
2978 ing in this block and there is a railroad spur on which a car can be spotted in the street adjacent, you can wheel direct from the car to the mixer and effect a *forg* material saving in that way. Of course a car of stone only contains about 30 to 40 cubic yards. You would probably use several cars in a day. Of course the sand and gravel, if you obtained it from the river, would be hauled directly on the job and dumped as closely to the mixer as the conditions might allow. That price might perhaps be reduced a little bit if you were closer than a half a mile, although the cost of getting the material on the wagon out of the river is quite an important item. The cost of a few blocks additional haul, considering a half mile haul, one or two blocks wouldn't make very much difference. If it was only a quarter of a mile you would possibly reduce it 25 per cent.

Q. What means of hauling have we here in the city of Des Moines outside of wagons; in other words, does the street Railway Company or Interurban Railway Company haul materials?

A. They do to a certain extent.

Q. To what extent?

A. I couldn't say to what extent, because as I understand it the major portion of that work is done at night after the general traffic is off the street, between the hours of twelve mid night and five A. M., so that it does not conflict with the ordinary traffic; but I am not sufficiently posted to be able to state to what extent that is carried on, though I am informed——

Complainant objects to what the witness is informed as being hearsay and secondary.

Q. They do carry on some freight business in connection with their other business?

A. Yes.

2979 Q. And that is true of the Interurbans is it not?

A. Yes.

Q. Then we have the Des Moines Union and the Des — Terminal Company?

A. Yes.

Q. Delivering cars to sidings and things of that kind?

A. Yes.

Q. Were you in the court room, Mr. Dobson, when Professor Marks was describing some concrete work with respect to the purifying house of the Des Moines Gas Company?

A. I believe I was.

Q. Something was said about the manner in which the forms were used there, what would be your notion of carrying construction of that character?

A. As I recall the particular piece of construction it was a form of curbing or coping somewhat similar to the ordinary street curbing used in paving work. I do not recall the exact height of it. I think about two feet perhaps and six or eight inches thick and approximately the same size; had a little finer finish on it than our curbing work for street purposes. The method of handling that small piece of work would differ a little bit from a piece of curbing work, because in organizing a gang for *for* a long stretch of curbing it is economical to use a large number of forms so that you can keep them going and busy practically the entire day filling forms, and for the next day's work perhaps move the entire set of forms forward; so that the forms are left in place perhaps a half day after the cement is put in place. In putting in a small piece of coping it is quite common to put the concrete in very dry and tamp it hard so that it has enough stability and that it will stand on the immediate removal of the forms—something similar to the ordinary build-
2980 ing block which is made in a mould and the mould immediately removed. It is the same way with this class of coping under ordinary conditions, and that would be the economical and ordinary method of building such coping.

Q. I will ask you what connection you had with the construction of the bridge across the Des Moines river at its intersection with Locust Street?

A. I designed the bridge and as city engineer was in charge of the general inspection of the work from some time about the 1st of September of one year until the 1st of April of the next year, and then for a period of about two month- I was the engineer in charge or inspector of the bridge personally.

Q. What is the character of the construction of that bridge?

A. That is a type of construction called reinforced concrete. It consists of five arches of reinforced concrete ranging from 72 feet in length to 92 feet in length on concrete piers and abutments and contains about 10,000 cubic yards of concrete, as I recall it.

Q. What connection have you had with the bridge now under construction over the Des Moines river at Walnut street?

A. As engineer of bridges I have had direct charge of the Walnut Street bridge.

Q. Is that the same type of bridge we have over Locust Street?

A. It is the same type of bridge, having six spans of shorter length, instead of five.

Q. About the same amount of concrete?

A. About 25 per cent greater; the street is wider.

The MASTER: Is the bridge wider?

A. Yes, both bridges are street wide. The Locust street bridge is
66 feet and Walnut street at that point is 82½ feet on the west side of the river; the width of the street on the east side is greater.

2981 Q. The Walnut street bridge is being constructed by what firm?

A. The John Wheeler Construction Company of Geneva, Illinois, I believe, is the home office.

Q. Do you remember what the contract price is for the bridge.

Objected to on part of complainant as irrelevant and immaterial to any matter in controversy here.

A. The original price was about $169,000; that was afterwards slightly reduced.

Q. And the Locust Street Bridge, do you remember the contract price for that?

A. That $124,800.

The MASTER: The Locust Street bridge is the first one built?

A. Yes, that is the upstream bridge; the one building now is the Walnut street bridge.

Q. Do you remember, Mr. Dobson, the terms of the contract between the city and some paving company for the repair of pavements in the city of Des Moines?

A. No, I have no personal recollection or knowledge of that.

Q. Do you know how the cost of repairing pavements corresponds with the original cost?

Objected to on part of complainant because if it is a matter of contract it is secondary and not the best evidence.

A. My knowledge on that is not direct.

The MASTER: The Locust Street bridge cost $12.48 per yard?

A. Yes, if 10,000 yards is the exact amount, that would be the price.

Q. What would be the difference in concrete work of that character and foundation work for buildings?

A. There is a vast difference, on account of the foundations
2982 and the risk of floods and ice. Take for instance our foundations go down to a depth of about eleven feet below extreme low water and in going down to that depth we encounter all manner of drift and sometimes large boulders submerged logs and old debris and wreckage of all kinds which is imbedded in the river.

Q. Of what material are the piers and abutments constructed?

A. Of concrete.

Q. What iron is used in connection with reinforcing?

A. The arches are heavily reinforced with steel. While I could not say off-hand, but I believe there are about 100 tons of steel in the Locust Street bridge.

Q. In constructing a bridge of that character and type, is it necessary to have special forms?

A. Yes. The form work is rather careful, close construction. The construction of a bridge of that type calls for careful work in the construction of the forms and in the finish of the surface that is exposed to view, and that of course makes quite a considerable item in the cost of any concrete work.

Q. A great deal of ballustrade work and things of that sort?

A. Yes. There is something like a thousand piling driven into the

bed of the stream for excavation to set the piers on. These piling cost an average of ten dollars a piece making about ten thousand dollars as the cost of driving the piling. The cost of centering for the arches would be a great item. For instance you have to drive bents of piling about every fifteen or sixteen feet in spaces eight or ten feet up and down stream. The price of that centering is probably three or four times as great as the cost of forms for ordinary concrete construction on land.

The MASTER: You did not go to bed rock then in the con-
2983 struction of the Locust street bridge?

A. No, bed rock is about thirty feet below the surface of the water, as I recall it. We attempted to drive the piling to the bed rock.

Q. What is the character of the finish of the work?

A. The most of the cement surface was gone over after the forms were removed and rubbed with either block of wood or a block of carborundum, depending on the freshness of the concrete.

Q. And with a stipple finish?

A. Nom the Locust street bridge was not stippled; there is no stippling or bush hammering as I recall on the Locust Street bridge.

Q. Mr. Dobson, in order to have it pretty fully in the record as to the experience which you have had in this city in connection with concrete work and public improvements in general, I wish you would state a little more in detail as to what other contract work you have been supervisor of or engineer or foreman or an inspector?

A. I designed and supervised the construction of culverts, concrete converts in the vicinity of Twenty-fourth and East Grand Avenue, and Twenty-eight and East Walnut, Twenty-eighth and East Dean, Twentieth and Easton Boulevard, on Sixth and Hartford on the south side, on Forty-first street in the vicinity of Forest Avenue, the north two arches of the Sixth Avenue bridge, and recently completed a design of small bridge across Four Mile creek at North Avenue, and one across the Des Moines river at North Avenue.

Q. Above or below these bridges?

A. That is about a mile above Locust Street bridhe and two miles below the Sixth Avenue bridge. I have had personal charge of the curbing work as foreman——

2984 Q. What kind of curbing work?

A. Combined curb and gutter work principally, some sidewalk work, or rather pavements, leading from the street to the lot line in connection with the curbing work.

Q. Just what was involved on your part in the performance of your duties in connection with this work?

A. The bridge work which I have mentioned I was the designing engineer of all of it and sometimes the inspector in charge or general engineer in charge with the inspector under me at times. In the curbing work I have mentioned I was the foreman in charge of the construction gang. In addition to that there was a great deal of work done under my general charge as city engineer, but I was not on the work daily from morning till night but attempted to make the rounds of the work practically every day and to spend as much time on the work as I could spare from my office duties.

Q. Have you been called upon in connection with your duties as city engineer or foreman or consulting engineer to make estimates of the cost of prospective work?

A. Yes.

Q. For whom have you made such estimates?

A. In connection with my city work I have made many estimates for the city. In connection with my work as consulting engineer I made many preliminary estimates for the Western Land & Irrigation Company of Wyoming, with which I was chief engineer; and for the Marsh Engineering Company of Des Moines; the Inter State Realty Company of Des Moines.

Q. Did these estimates which you made from time to time involve a knowledge of the unit prices of materials and the cost of labor?

A. They did.

2985 Q. In the city of Des Moines and in the other places where you were engaged?

A. Yes.

Q. You have devoted all of your time practically since 1893 on this class of work?

A. 1903, yes. The principal part of my work has been devoted to construction work, either in connection with designing or supervising.

Cross-examination by N. T. GUERNSEY, Esq.:

Q. What is the Western Land & Irrigation Company?

A. That was or is a company organized for the purpose of irrigating certain tracts of land in the state of Wyoming.

Q. Who is the president of it?

A. The president of it is W. B. Martin of Des Moines.

Q. Former secretary of state?

A. Former secretary of the state of Iowa.

Q. Who is the secretary?

A. The secretary is W. H. Harwood of Des Moines, who is also I believe secretary of the Interstate Realty Company of Des Moines.

Q. What work did you do for the Western Land & Irrigation Company?

A. The work which I did for them was making surveys for the purpose of locating irrigation ditches and reservoirs and estimating the cost of ditches and reservoirs, dams, head gates, spill ways, and such other things as might be involved in the designing or construction of the irrigation system.

Q. When was this irrigation system constructed?

A. It was not constructed. I said my work was in the survey and *and* location and designing and estimating the cost of construction.

2986 Q. Nothing was done after that?

A. No.

Q. When was this estimating done?

A. The estimating was done, as I recall, in 1908 and 1909.

Q. The work has not been commenced yet?

A. No.

Q. Do they ever expect to begin it?

A. They have hopes, if they are able to get into the bond market.

Q. If they can get somebody to put up the money?

A. That is what I understand.

The MASTER: Where is that?

A. Their land is situated in Carbon County, Wyoming, in the southern tier of counties in the central portion of the state; my headquarters were at Saratoga, Wyoming.

The MASTER: Is the cement made out there?

A. No the cement I used for the purpose of estimating the cost was made in Colorado, at Portland, Colorado, and I believe I got quotations from other firms. There is no cement made in the state of Wyoming that I have knowledge of.

Q. Now what work did you do for the Interstate Realty Company?

A. I did some work for them at various times in connection with their construction of street improvements in Gilmar Park, which is an addition in the vicinity of Forty-second and Ingersoll Avenue, that involved the designing of a sewer system, curbing and paving work.

Q. That is comparatively a new addition out west here?

A. Yes.

Q. They laid out some streets and put in sewers and curbs and cement walk and things like that?

A. Yes, it has been laid out within the last three years I should judge.

2987 Q. The Marsh Engineering Company, what is that concern?

A. That is a concern that build reinforced concrete bridges; they have headquarters in Des Moines.

Q. Are you consulting engineer for that concern?

A. No. I am not connected with the Marsh Engineering Company.

Q. I thought you mentioned it as one of the concerns for which you were consulting engineer?

A. Mr. Brennan asked me to name the work I had done for the city and as consulting engineer, and I mentioned in connection with that that during the period I was not connected with the city I did such work as came my way, either bridge or other engineering work.

Q. When was it you were employed by the Marsh Engineering Company?

A. I do not recall the exact date; I had occasion to make plans during the winter of 1909, I believe.

Q. How long were you employed by the Marsh Engineering Company?

A. I was not employed steadily by them and did not do a great deal of work for them; did a little work for them.

Q. Did some drafting and that sort of thing?

A. Well, you might call it drafting; I made some original designs in competition with the best designs they have been able to get

out and they were adopted by the Marsh Engineering Company, because the designs were more economical than those they had been using.

Q. You told us the Locust Street bridge cost $124,800?

A. Yes, that was the contract price.

Q. Is that what it cost?

A. There were no extras involved; the only additional cost would be engineering which would amount to probably I should say $2,000.

Q. You stated you designed that bridge?

2988 A. Yes.

Q. Do you know who the Thatcher Engineering Company is?

A. The firm you refer to I presume is the Concrete Steel Engineering Company of New York City of which Mr. Thatcher is president.

Q. What did they have to do with that bridge?

A. The principal thing he had to do, he came out and looked over my plans and threatened me with a suit for infringement of patents. I told him I would be glad to assist him in any way and if he could find any infringement the city of Des Moines would be glad to make it good.

Q. You adopted his plans?

A. No. Evaded his patents and did not adopt his plans in any manner or shape. Mr. Thatcher did not get a penny's worth of money or credit from the Locust Street bridge design.

Q. The contractor failed, didn't he?

A. I believe they failed during the construction of the work.

Q. Who was the contractor?

A. The Marsh Bridge Company of Des Moines.

Q. Was it related in any way to the Marsh Engineering Company?

A. The same men who are operating the Marsh Engineering Company were connected with the Marsh Bridge Company at that time.

Q. The Marsh Engineering Company was a sort of reorganization after the failure of the Marsh Bridge Company?

A. That is my understanding.

Q. After the Bridge Company failed, who completed the work?

A. The receiver I believe, as is customary.

Q. Did the city do any part of it?

A. As to that I couldn't state positively. My connection with the city was severed before that time.

Q. I had an impression the city finished up a part of the work?

2989 A. They may have finished a portion of it, I could not state positively; but it is my best judgment that the Marsh Bridge Company did not fail on account of liabilities incurred in that bridge.

Q. I didn't ask you anything about that. I suppose that would involve going into the finances of that concern.

Mr. BRENNAN: You wouldn't want that inference to be drawn then?

Mr. GUERNSEY: My purpose in asking the question was to get at the fact. The price of $124,000 does not necessarily indicate what it cost.

Q. So that you do not know whether $124,800 represents the cost of the bridge or not?

A. Not positively.

The MASTER: I understand you that was the contract price?

A. That was the contract price, and they had a first class bond up and the bond company and the receiver completed the work; that is to say, the receiver completed the work, and if there was any additional expense, the bond company stood between them and the city.

Q. Which is the more economical so far as making concrete and placing it is concerned, doing it in large masses or small masses?

A. Large mass work is always more economical, other conditions being the same.

Q. Not only in the matter of placing the concrete, but in the matter of forms and everything of that kind?

A. The organization of your whole construction gang is more economical for large work.

Q. What kind of mixers do they use in those large jobs?

A. They vary——

Q. I don't mean the name, but what type?

A. There are two distinct types principally used; one is
2990 the continuous and the other the batch mixer; there is also in contra-distinction of these two the gravity mixer.

Q. They do not use these gravity mixers here?

A. Not to any extent. We did on the Sixth Avenue bridge.

Q. These mechanical mixers on large jobs are operated by steam?

A. Steam or gasoline, and sometimes by electricity.

Q. Where have they been operated here by electricity?

A. On Walnut Street bridge.

Q. Of course it is not economy to operate by steam or gasoline a mixer on small jobs?

A. Why not?

Q. Suppose you get a small job of concrete, only 20 or 30 yards, how much does it cost to set up your machine?

A. They have very economical machines that weigh only about four or five hundred pounds and you can wheel them on to a job and mix a batch of three or four yards and two or three men can get hold of it and move it on.

Q. Tell us some jobs in which those machines have been used here?

A. You take the general run of curbing work and you may have noticed a little type of machine that is a continuous mixer; they throw the sand and gravel and cement into the hoppers continuously and that feeds with a set screw.

Q. We don't care how you operate the machine; I asked you to name some jobs in Des Moines?

A. The city of Des Moines is doing that every day during the construction season on side walk construction. J. L. Hansman is *is* one of the contractors who uses one of the same type of machines the city does. While I could not attempt to state what any contractor in the city of Des Moines uses, it is so common that there isn't anything to be gained by quibbling over it.

2991 Q. So you don't want to quibble over it?

A. The less you go into that the more you will gain.

Q. I thank you for your instruction, but we will have to go into that ourselves. Take your ordinary job, what is the smallest curbing contract that has been let within the last three or four years say?

A. Oh, I couldn't state what the smallest contract is.

Q. I want to get the smallest job on which you used these things, give us the smallest curbing contract you can recall here.

A. I doubt if I could give you any information off-hand, without referring to the city records, because my personal information as to the size of curbing contracts is limited.

At this time an adjournment was taken until 1:30 P. M.

2992 1.30 P. M., MONDAY, *September* 11, 1911,

GEORGE E. DOBSON being continued on cross examination by N. T. Guernsey, Esq., testified as follows:

Q. You said you graduated in 1903?

A. Yes, sir.

Q. From Cornell University?

A. From the engineering department of Cornell College, Iowa.

Q. Where is it located?

A. Mt. Vernon, Iowa.

Q. And since you graduated you have been in the employ of the city how much of the time?

A. Probably fifty per cent of the time.

Q. When were you first employed by the city?

A. In the spring of 1904 I believe.

Q. The year after you graduated?

A. Yes, sir.

Q. Did you remain continuously in the employ of the city until after the termination of your term as city engineer?

A. Not exactly. In a sense I was, I was with them on a salary basis for quite a length of time up to the completion of the construction of the Sixth Avenue bridge. After that my work for the city consisted of the designing of the Locust street bridge which was done on a contract basis and soon after the completion of that piece of designing I was elected city engineer, so that in a sense I have been continuously in the employ of the city since 1904 with the exception of about two years. About half of 1908, all of 1909 and the early part of 1910 I was not employed by the city.

2993 Q. During those two years how were you employed?

A. A portion of the time I was engaged in work for the Western Land & Irrigation Company. A portion of the time I was secretary and engineer for the Iowa State Drainage, Waterways &

Conservation commission. A part of the time I was engaged in general practice in the city of Des Moines.

Q. Now you said a number of streets were paved, west Locust, Second to Ninth. Walnut west to Ninth or Tenth street; Court Avenue from the river to the Court house; east Walnut street part of it and then some on Second north of Grand. All of that paving was renewal of old paving, all I have mentioned to you?

A. I believe it was.

Q. The streets had been paved and the paving was torn out and new paving was laid?

A. Yes, sir.

Q. Kingman Boulevard and Des Moines street were new?

A. Yes, those were new pavements.

Q. And on Kingman Boulevard there was a concrete foundation.

A. Yes, sir.

Q. Des Moines street there was too wasn't there?

A. Yes, sir.

Q. And this Ascension street experiment did not have concrete?

A. No.

Q. That didn't work out very well?

A. No; we regretted experimenting.

Q. Now this work, how much of this work that you have referred to has been done by the city itself and how much of it has been done under contract?

A. The paving work probably was all done under contract so far as I recall. There may have been odd jobs of repair work, but at that time there was a very low limit to the amount of work
2994 that the city might do itself by day labor and so you might say practically all of it was done under contract, all the street improvement.

Q. That included the sewering, curbing and sidewalks?

A. Yes, sir.

Q. What bridge work has the city done itself not under contract?

A. The principal work that they have done in the bridge department is smaller culverts, ranging up to a $1,000 or $1,500 in cost. I can give you a statement of some of them if you wish. There was one on St. John's road which we recently completed this year, that was in the vicinity of 37th street. Another on Forty first street north of Forest Avenue. One on Dean Avenue I believe in east Des Moines, on the corner of 28th I believe and Dean Avenue, right next to the Hosiery mills. One on the south side at Sixth and Hartford, one out on the lower—well it is the bottom road south of Raccoon road and east of Eighteenth about a quarter of a mile.

Q. East of Eighteenth?

A. Did I say east, I should have said west.

Q. These are all relatively small jobs?

A. Yes, sir.

Q. They have all been done within the last year or two?

A. Yes, those I have mentioned.

Q. What other bridge work is there that the city has done that that you know of?

A. Those are the only ones that they have done under my supervision as engineer. There are other bridges perhaps.

Q. Those are the ones you have personal knowledge of?

A. Yes, sir.

Q. They have all been done within the last year?

2995 A. Within the last eighteen months at the outside. It might be less than that time but not over eighteen months.

Q. Now on those jobs have you kept accounts of the costs?

A. The records are kept on all of those city jobs and the total is footed up when the work is completed. That is to say all the items that enter into the cost of a bridge or culvert is placed on the records.

Q. Now what records show those costs?

A. Well the record in the department of streets and public improvements. The actual clerical work of keeping that book, I don't know what the record book itself or volume is. It is kept by one of the clerks in Mr. MacVicar's office.

Q. But what I want to get at is, where these records are that give you your information as to unit prices based on your experience. Can you describe these books so we can find them?

A. No, I don't know that I could give you the name of the book. Most of the data which I keep for my own use has been general data in regard to——

Q. I didn't ask you that, I asked you if you could describe the books. Now then can you bring in here the figures showing actual cost say of this culvert on the St. John's Road?

A. I believe I can.

Q. Will you do that for us?

A. I will if I can, if I can find the record as I believe I can.

Q. Will that record show what the concrete cost per yard or give information that will enable us to compute that?

A. Not the actual cost of mixing and placing. I don't know that the record was kept in such shape that you can separate all the items in the way that you perhaps have in mind. That is to say the record there shows the cost in account of cement, the

2996 amount of sand and gravel, the amount of steel, the amount of lumber and the total cost of labor that was employed on the city record book.

Q. Of course you haven't any detailed costs on this work that was done by contract and not done by the city?

A. I know—if you mean by detailed estimates no book records on any or all of this contract work.

Q. The contractors don't file with the city do they their figures showing in detail the cost of doing the work?

A. They very often file with the city an estimate sheet for the purpose of getting estimates. That is detailed to the extent of separating the various classes of work such as foundation excavation wet and dry, cost of pile driving, cost of putting in cofferdams, cost of centering, cost of frames.

Q. That is all bridges you are talking about now?

A. Yes, sir. The assessment work, paving, sewers and curbing have no such estimate sheets filed with them.

Q. On these two big large bridges then there have been some detailed estimate sheets filed?

A. Yes, sir.

Q. And where are they?

A. I have a record of those, there are probably several of them on file in the city hall. There is one in the department of civil engineer and I have one in my possession. A very easy thing to produce those if you care to look them over.

Q. Now then what work is there, take work you have been in charge of or been personally concerned with it where you have kept the costs in detail so that you have some actual costs?

A. Well the work on the Locust street bridge and Walnut street bridge and practically every other piece of work that I have
2997 been on as inspector and engineer I have made investigation from time to time as to the actual——

Q. That don't answer my question. I asked you what work where you yourself was personally concerned with it, I don't mean work contracted to somebody, but where the city has been doing the work or you have been doing the work that was being done or where you had charge of these matters, what work is there of that kind where you had an opportunity to analyze the cost?

A. The curbing work which was done in Gilmar Park I was required to keep a quite close estimate of cost there, and that was submitted to the owners on that from time to time to show how the work was progressing, to show whether we were keeping within the preliminary estimates we had set for the cost of the work and so far as my own records go I do not recall where I could lay my hands on detailed estimates of various classes of work that you refer to. A great deal of this matter is worked out—that is my own personal work. The cost is worked out on a unit basis under different conditions and so far as keeping a complete journal and jotting down items, elements that go to make up this cost I have not done that to any extent, but I have familiarized myself with practically every job I have been connected with or associated with, I have familiarized myself with the average cost of working under various conditions so that I am able to figure on an ordinary piece of construction work similar to the kind I have been engaged in what the cost would be.

Q. Now then what all intelligent contractors do is to keep account of these things on actual jobs and in that way ascertain just what the cost is, that is a fact isn't it?

A. I believe most contractors do keep a complete record.

Q. And they do not theorize about it, but they predicate
2998 their conclusions on their actual experience, isn't that a fact?

A. They do to a great extent the same as I say I have.

Q. Now what experience of that kind have you had, what job did you ever do at mixing concrete for instance. There is one thing you have referred to, that is hauling stone. Now tell us how many jobs you have done this where you kept an actual record of the cost of delivering the stone from the cars on the job?

A. I don't recall that I ever personally kept that.

Q. Now how many jobs have you done where you kept a record of the actual cost of the labor in mixing and placing concrete?

A. There have been numerous jobs where I kept these records either continuously or at intervals. The Locust street bridge.

Q. Give us one of them?

A. The Locust street bridge.

Q. That is a job where the contractor is doing it. Does the contractor furnish his books to you or do you ask his books to find out what he pays out and take his vouchers for cement or for hauling stone, do you do that sort of work with the contractor's books?

A. Yes those vouchers are filed with the city.

Q. All the vouchers filed with the city?

A. The receipted bills, the pay roll is receipted and filed with the city and cement and steel and stone and gravel bills.

Q. To protect you against mechanics' liens you have some sort of statement of that kind.

A. Yes, so that we have access to their records.

Q. It is from these statements filed with the city you have made up these things?

A. Not altogether. Taking into account these facts which I have been able to get access to and which I have verified to a sufficient extent to satisfy myself.

2999

Q. So that we can take these statements filed with the city as to the Locust street bridge and compute these things from them can we?

A. No the records on the Locust street bridge were not complete. The records on the Walnut street bridge are very complete.

Q. Such records are filed with the city as will enable us to find out how much the cement in a yard of concrete costs?

A. No, sir; not these records alone, but in conjunction——

Q. That answers the question. Now will they enable us to tell what the labor in a yard of concrete is?

A. Not necessarily.

Q. Well will they unnecessarily?

A. Probably not.

Q. Don't you know whether they will or won't. Didn't you just tell us those were the records from which you made up your estimates?

A. No, I didn't just say that.

Q. Now will they show you how much the cost in a yard of concrete is on account of tools and machiery and that sort of thing?

A. They will not.

Q. Will they show you or will they enable you to compute the cost of any item that goes to a yard of concrete in place?

A. These records alone will not be sufficiently accurate.

Q. Now to get back to my question, where is the job of work you have ever kept these records so it will enable you to compute the detailed cost of a yard of concrete in place, basing it on your experience, not on what somebody told you.

A. I have kept records as I have stated and repeated before on

numerous jobs under normal conditions. The St. John's
3000 bridge was one and the curbing in Gilmar Park and the mixing and placing of concrete on the Walnut street bridge, the Sixth Avenue bridge and the Locust street bridge.

Q. In the Walnut, Sixth Avenue and Locust street bridges you have just said you did not have this information in detail as I understand it.

A. I said the records and vouchers filed with the city were not in such shape a person could go to them, that is in all probablity — be very nearly impossible to pick out these items, but in conjunction with my personal knowledge of the work and record and investigation of the number of men employed in handling a certain amount of concrete that these records are of assistance in arriving at a fair cost.

Q. But that is not the question I asked you at all. I am starting out with a proposition that as to what would be a fair cost ought to be predicated on experience.

A. Yes, sir.

Q. That is sound isn't it?

A. Yes, sir.

Q. A man don't know what a thing costs him himself in doing work unless he keeps accounts carefully and accurately analyzes them, that is sound isn't it?

A. Yes, that is fairly sound.

Q. Now on what job of work have you kept the accounts in that way?

A. I have kept accounts as I stated before on every job I have been concerned with so that I can keep a sufficiently accurate estimate of the cost of the work as it is going in from time to time, the different classifications of work. But so far as having these records all in my office at the present time I have not got them, but that does not prevent a man from knowing full well the cost of
3001 these various items and being concerned with that class of work day after day and carrying that class of work in his head and is just as reliable for certain classes of work as though you had it in a note book and could only figure the cost of a bridge by referring to what it had actually cost on the last job.

Q. The question I asked you was to specify the job on which you had kept a detailed estimate. Now will you please specify that job, just give me one. Don't give us generalities, and don't give the Locust street bridge or Walnut street because we have been through them.

A. According to your theory then an engineer or inspector on a piece of work——

Q. I didn't ask you anything about that. Answer the question please.

(Question read.)

A. The Gilmar Park curbing.

Q. Now did you keep there a separate account of the cost of cement and cost of stone. Did you use broken stone?

A. Used gravel there.

Q. Didn't use any broken stone?
A. No.
Q. And cost of labor, cost of tools, and things like that?
A. Yes, I recall we kept everything itemized, labor, cement and excavation and tools lumber for forms, itemized it completely as possible.
Q. Now on what other job did you do that?
A. I don't recall at the present time any job where I itemized it as completely as I did on that personally.
Q. What did the cement cost you per cubic yard there?
A. I don't recall at the present time just what it did cost.
3002 Q. Do you recall what any item that went into concrete in place on that job cost?
A. Yes. It cost us as I recall approximately 75 cents a cubic yard to mix and place the cement, concrete.
Q. That was on curbing?
A. That was on curbing work.
Q. Do you recall any other item there?
A. The cost of excavation.
Q. For curbing you mean?
A. Yes. It was shallow excavation ranged from six inches to 12 inches in depth and 24 inches in width, that ranged around 16 or 17 cents a cubic yard as I recall.
Q. How did you excavate it?
A. Excavated it by shovel.
Q. What did you pay your labor a day?
A. We paid as I recall now $2.25 for nine hours.
Q. Sixteen cents a cubic yard, how much would a man, you figure then each man would handle fifteen yards in a day. Isn't that going pretty strong?
A. Well I tried to make them go pretty strong I had to deliver the goods.
Q. Do you know any other job where that has been done?
A. Yes. That is to say I don't know as I can specify any particular job, but a good first class shoveler will handle that much work in that character of work.
Q. Especially easy shoveling was it?
A. No not extraordinarily easy shoveling, it was average.
Q. That would not leave you anything for tools on account of that part of the work would it?
A. The tool account you mean on the excavation? No
3003 that don't include the cost of the tools.
Q. That is one of the factors isn't it?
A. Yes, sir.
Q. So that they must have handled more than fifteen yards a day if you get all of your cost into your sixteen or seventeen cents?
A. No, I think that there is a misund-rstanding as to what I mean. That is to say I do not include the cost of tools in the price per yard of dirt moved.
Q. It is part of the cost of moving it isn't it?

A. It was, but on that job it was kept as a whole on the entire piece of work, that is to say that——

Q. So that factor was omitted then from your concrete work?

A. The cost of tools was not included in the cost of seventy five cents per cubic yard. That was the actual cost of labor and supervision, did not include wear and tear on tools.

Q. Any other factors you omitted?

A. I do not recall now. If you would like some data on the cost of tools for the entire yardage of concrete I can figure that up for you and show the court how much the item of tools on a yard of concrete amounts to. Rather insignificant when you come to distribute it.

Q. Yes, just as seven cents does not look very big for a foot, but if you run into the hundreds of thousands of feet that is a factor and if the contractor omitted it he would probably go broke wouldn't he?

A. Well it would take a good many omissions of the character of tools to break a contractor with the ordinary profit that they figure.

Q. You think that profit is rather large?

A. I don't know that it is beyond reason for the class of work that they do. I would probably want the same profit if I were
3004 doing —.

Q. As a matter of fact it is true isn't it that the profit they figure and the profit they make is very seldom the same?

A. Yes, it is very seldom that the yards will come out and the dollars and cents the same as the contract figures. One time he may make a big cleaning and another time just barely skin through and another time go broke?

Q. That is on account of these contingencies and unforeseen expenses and things like that?

A. Not altogether, unfo-eseen conditions arise such as water, labor trouble or misjudgment on the part of the contractor in regard to a foreman or superintendent on a piece of work and things like that, of course that enters into it. It varies.

Q. The factors vary, you know they are going to be there, but you can't just tell what they are going to be?

A. Yes, ordinarily the contractor allows a certain amount for unforeseen expenses, such as five per sent or ten per cent, take it on a bridge job where you are liable to get floods he may allow as high as ten per cent of the tota- contract for unforseen difficulties. Street work where you work on top of the ground the dangers are not as great and don't have to allow nearly such a large margin.

Q. Have you examined this soil map that is complainant's Exhibit No. 16, if I recall it correctly?

A. I had not examined it before the present time.

Q. Will you look at it hastily and tell us whether it is substantially correct in your judgment?

A. To what depth—is this supposed to be surface or how deep is this soil supposed to lay?

Q. I don't suppose much of it would go over five or six feet.

Objected to as not proper cross examination.

3005 Q. Just assume it would be a depth that would be proper for the laying of gas mains, that is what I presume is what the plat is intended to show.

Objected to as incompetent, assuming a state of facts not shown by the evidence and not proper cross examination.

A. It corresponds in a general way with my information on the soils of the city.

Q. The prices of paving that you gave were the contract prices at which the city had let paving jobs recently were they not?

A. I believe that is what I gave.

Q. They do not purport to cover a period of years or any considerable period?

A. No as I recall they were for the last year or two.

Q. Now then you gave $1.58 for asphalt on concrete?

A. That was the lowest price that I have any knowledge of their ever getting in Des Moines, that was recently.

Q. What is the highest price you know of?

A. I think I stated it ranged over $2.00 some fifteen or twenty cents.

Q. The average would be over $2.00 wouldn't it?

A. Average of $1.58 and $2.00?

Q. Taking into account the amount of work done?

A. The average cost of paving actually laid in the city of Des Moines is probably in the vicinity of $2.00.

Q. You mean asphalt or all pavement?

A. Asphalt, but recently under competitive bidding there has been an enormous break in the price. It is safe to say over ninety per cent of the work done in Des Moines was not under competition.

Q. Now how many contracts have been let at $1.58?

3006 A. Two.

Q. Coverinh how much paving?

A. I don't recall just how many yards. They are in the residence district, not any extraordinary large jobs, rather small as I recall.

Q. And with five inches of concrete?

A. Yes, and with one and one half inches of wearing surface.

Q. How do the ordinary specifications runs, the small amount?

A. The business district we generally use six inches concrete and two inch wearing surface. That makes a more expensive job of paving.

Q. Now this $2.00 a yard includes the payment to the contractor?

A. Yes, sir.

Q. That is all?

A. That is the price that the contractor gets for the work, yes.

Q. It don't include engineering?

A. No.

Q. It does not include the work incident to the letting of the contracts?

A. No. When I say the $2.00 that is not a hard and fast average at all.

Q. I understand that, but we are taking that as sort of an average price. It does not includ- advertising for bids.

A. No.

Q. It does not include the making of the assesments?

A. No.

Q. It does not include the inspection of the work?

A. No.

Q. It does not include the drawing of the contracts?

A. No.

Q. It does not include the engineering work as the work
3007 progresses, setting*b* stakes and think*s* like that.

A. No.

Q. You said it did include the discounts on the securities?

A. Yes, if there is any.

Q. Well you said ordinarily there was one?

A. That is my information, yes, ranging from two to three cents on the dollar.

Q. These securities are the liens on the abutting property?

A. Yes, sir.

Q. First liens?

—. Yes, sir.

Q. And mature in seven annual installments?

A. Yes, sir.

Q. Drawing interest at the rate of six per cent?

A. Yes, sir.

Q. And they won't take them at par?

A. Apparently not.

Q. They have to be discounted?

A. Apparently.

Q. That is part of the expense of the work, the contractor gets pay for that?

A. Yes, he has to take that into account.

Q. Now how do they pay for the bridges?

A. They pay for the bridges partially in cash and sometimes with paper depending on the condition of the bridge fund. The Locust street bridge contract as I recall was $50,000 cash and the remaining portion of the price was to be paid in three annual installments of $25,000 each and I believe bearing interest at six per cent. The Walnut street brid*he* was I think $20,000 in cash and the remainder
was payable in either $10,000 or $15,000 payment per an-
3008 num, but it was afterwards changed and the price of the contract reduced on account of the city having sold said bridge bonds and having the cash with which to liquidate the indebtedness at the completion of the bridge.

Q. The city sold these bonds did it?

A. I understand they have yes.

Q. These bonds are drawing interest?

A. I presume so if the cash has been delivered.

Q. And I suppose the city has deposited what money it is not using in the banks trying to make it earn something?

A. Presumably.

Q. And the difference between the interest which it has to pay

and the interest it earns there, have you included that in the cost of the bridge or not?

A. At the present time you mean under the new arrangement?

Q. Yes.

A. No, I have not stated anything about the effect that that had on the total cost.

Q. You said it reduced it didn't you, reduced the contract price in consideration of being paid?

A. Yes, the contract price was reduced.

—. Did you offset against that reduction or any part of it the interest which the city was losing?

A. I have not had occasions to figure that at all. I knew that the reduction in the contract price and the bonus which the contractor guaranteed the city on the sale of the bonds amounted to $5,000 or $6,000.

Mr. BRENNAN: About $7,000.

A. I did not know the exact amount.

Q. Do you pay on this bridge any installments as the work
3009 progresses?

A. Monthly estimates, 85 per cent.

Q. So the contractor only has to carry for the entire period fifteen per cent of the cost of the bridge.

A. Yes, when the work is completed he has fifteen per cent hold back.

Q. Now these paving prices, return-ng them are prices for paving done as paving is ordinarily done in jobs that are several blocks long and covering the entire width of the street.

A. Yes, sir.

Q. It is your judgment it would cost less to do the paving necessary to cover a ditch for a gas main for instance, than to do this big job, less per yard I mean?

A. There are certain conditions of street construction here that would be more expensive I believe that relaying pavement in a trench. Now take for instance asphalt, you have the old pavement on each side and you don't have so much care and trouble about getting your grades on the work and the concrete that is there before you all the time, the men worked faster on account of that, do not have to guage the thickness of the concrete or asphalt or wearing surface or take any great amount of time for that and when it comes to rolling you have got a straight away roll and it has got to iron out the same elevation as the asphalt on each side and you can use one big roller instead of a little roller and then a big roller as is done on all paving wor- so it would be my judgment that you could probably lay new asphalt pavement over a trench as cheap or cheaper than you might do u-der ordinary conditions.

Q. Is that judgment based on any experience?

A. Merely observation of the work, not on data which I
3010 have.

Q. And that is your judgment that it would be cheaper per yard.

A. Yes; not taking into account any salvage at all.

COURT: What width do you figure on a main?

A. Well the trench would run from two to three feet in width. I suppose the larger mains would take even wider perhaps than three feet but there would not be any paving less than two feet in width I don't believe because ordinarily the pavement is opened up a little bit wider than the actual width of the trench.

Q. Now with reference to this trench. You make the excavation seven inches a running foot for a trench eighteen inches wide was I recall it?

A. Yes, sir.

Q. That is in what kind of soil?

A. Well that would be average digging, in what you would call average condition here in Des Moines. There are conditions where you had good digging that you would be able to dig a trench cheaper than that and there are classes of soil here it would cost you more but that is my judgment that is a fair average price.

Q. And that is predicated on what actual experience?

A. Well not on any great amount of detailed cost keeping but general investigation of sewer trenching from time to time in order to verify my own opinions and knowledge as to what that work has actually cost or should cost.

Q. Did you ever keep al- the costs in trenching?

A. I don't recall I ever did on any extended amount.

Q. Well did you ever keep any cost of trenching?

A. Yes, sir.

Q. What job?

A. You mean that I was personally in charge of?

3011 Q. Yes, where you had personal charge?

A. Not any as foreman directly in charge I didn't keep any detailed cost.

Q. On one where not directly in charge, where did you ever keep detailed cost. I want the job specified and not an explanation showing why it is not necessary?

A. As I recall it now, I kept fairly close tab on some work which was done under my charge at the fair grounds, some tiling for drainage purposes that was in mostly a black soil.

Q. When was that?

A. That was in 1909 I believe, summer of 1909.

Q. How much work was done, how many miles?

A. I don't recall the exact length, I don't think it run into miles.

Q. Well how many feet?

A. There was several thousand feet of drain tile, four or five thousand possibly, possibly less than that, I don't recall exactly.

Q. How deep was it laid?

A. As I recall it ranged from three to four feet principally.

Q. Have you the figures?

A. I may have them some place in my records, I have not them with me.

Q. Can you remember any specific item of cost there going to make up the aggregate?

A. Of that trenching?

Q. Yes.

A. I recall that—no, I don't know as I could give you the dif-

ference in—that is to separate it into anything as to the cost per lineal foot.

Of course there was a division, that is there was two items
3012 the general cost of labor and a foreman on the work and the cost of staking the work out, but at this time I cannot recall what those individual items came to.

Q. Now then you took 25 or 30 cents for the labor for removing material from the trenches, that much per cubic yard in making your estimate did you?

A. That is my recollection that I gave that figure.

Q. That is for the labor for moving material from the trenches?

A. That would include the supervision, that is all items that would enter in.

Q. What are the items that are included?

A. Well for the price I have hiring the work done you have to have—that is on la*gre -owk* you have to have a foreman in charge and his salary of course has to be distributed over the entre work and a certain amount of wear and tear on tools or loss by theft and cost of maintaining lights and such things as that if you are working in the streets, barricades you might say, to protect the general public.

Q. Well are these all the items?

A. That enter into the cost of trenching?

Q. No, that you considered here and got your 25 or 30 cents. Can you tell us what your 25 cents is made up of?

A. If you had a large enough amount of trenching so that you would employ a force of twenty men which is a sized organization that one man can keep going, that is one foreman would handle twenty men without any difficulty and you paid them at the rate of 25 cents an hour, a foreman on that class of work would get from $3.00 to $4.00 a day, an extra good man might get as high as $4 an average would not be any greater than $3.50 a day and the ordinary wear and tear and loss on tools for all trenching
3013 including by theft and breakage of lanterns, red lights and things like that, in my judgment would not amount to more than 50 cents per day for that size gang. That 25 cents per yard would necessitate the digging of a little over 700 feet of trench with a gang of 20 men. That is figuring the trench a foot and a half wide and five feet deep.

Q. That did not give me what I asked for. Did you there or can you now tell us the various items, how much on account of labor, how much on account of tools, how much on account of incidentals and so on, go to make up that 25 cents.

A. Well I have just stated my judgment on that is in the proportion I gave you twenty men at 25 cents an hour nine hours constitute a day's work would be $45, a foreman at $3.50 and 50 cents for loss of tools would make $49 are the principal items.

Q. What are the other items?

A. Well there are incidentals that might enter into that, for instance you might encounter a boulder that would increase the cost of work in one instance or you might strike a little change in the soil that would cause a cave in where you had figured it would not

require any shoreing. It might run it up to thirty cents, if every thing goes smoothly 25 cents should be ample to cover that but five cents a yard ought to cover all contingencies, unexpected and unforeseen contingencies.

Q. You make it about 20 percent then?

A. That should be ample on trenching, yes; rather large.

Q. Did you ever take some work with a gang of men and keep track of these things so that you know that these figures are right?

A. I never itemized them closely enough on a continuous
3014 job or anything of that nature so that it is based on absolutely daily records. And as I stated that my estimate of the cost of trenching is based on observation of sewer trenching that I have seen done, that is came under my observatio*b* and I have compared that at different times with the water and gas gangs as a matter of curiosity. I have not had occasion to keep tab on the water company or gas company because it is something that don't come under my charge so I didn't keep detailed estimates of that.

Q. Now going back is that seven cents a foot based on the 25 cents or 30 cents a cubic yard?

A. That figures seven cents a foot for 25 cents a yard.

Q. That don't include then that five cents for contingencies?

A. No.

Q. So if you include that contingencies would be one fifth more, be 1.4 making it 8.4 cents wouldn't it?

A. Yes, sir.

Q. That is for an 18 inch ditch, if it was two feet ditch, you would have to add one third to that wouldn't you?

A. I should think so.

Q. That would be 2.8 cents, that is right isn't it?

A. I believe it is.

Q. So that would make the excavation per lineal foot 11.2 cents on a two foot ditch.

A. Apparently.

Q. And the only estimate you made on back filling was scraping it in with a team?

A. That is my recollection, yes.

—. And you put that at 3 cents a foot.

A. Yes, that is scraping back with a team and flushing with water.

3015 Q. And you would have to add one third to that for a two foot trench?

A. I presume so.

Q. So that would make that four cents?

A. Yes, sir.

Q. That would make your excavation and back filling 15.2 cents per lineal foot on a two foot trench on your theory?

A. Yes, according to all the information that I have on that.

Q. Do you know that the charge made by the water company for flushing is 3 cents a foot?

A. My recollection was that it was 2 cents, if I am mistaken in that if that information is not correct I am mistaken, but my recollection was *there* price is 2 cents a foot for back flushing sewers.

Of course sewers as I stated range from eight to twelve feet in depth and the amount of water necessary to flush would vary——

Q. Mr. Haines just tells me the water company charges 3 cents a foot for flushing alone?

A. Of the company's trenches?

Q. Yes.

A. Well he has information on the subject undoubtedly that is authentic.

Objected to as incompetent and mere hearsay.

Q. Your information was hearsay from somebody wasn't it?

A. Yes, as I recall it different times I inquired at the water company's office as to what they charged for back flushing sewers and they have told me of course so you might say it is hearsay, but I supposed it was authentic information, and the cost of flushing an 18 inch trench they would charge just as much for our ten inch sewer, that is where we had a trench narrow enough for a ten inch sewer apparently didn't make any difference in the
3016 size of the sewer, flushing over a 24 inch sewer for the same price that they did for a ten inch so that I don't know whether they have a hard and fast scale or sliding scale for different sized trenches.

COURT: You- understanding is it is two cents or three cents?

A. Two cents.

COURT: Two cents for flushing?

A. Yes, two cents a lineal foot for flushing for back filling.

Q. If as a matter of fact they charge three then you would have to add some more to your estimate?

A. Well I suppose that would enter into this if they flushed all their trenches.

COURT: This 15.2 cents includes the flushing?

A. That would, yes.

Q. That includes two cents for flushing as I understand it?

A. Yes.

Q. Now then most of these mains are laid under pavement are they not?

A. Gas mains?

Q. Yes.

A. It is my judgment most of them are at the present time under paved streets.

Q. Of course they would have back filling on paved streets——

A. If they actually lifted a paving and replaced it——

Q. I am not talking about lifting it and replacing it, I am talking about back filling.

A. On an unpaved street the trench I suppose would be back filled and flushed with water, it might be——

Q. Take the back filling on a paved street this method you describe could not be employed could it?

3017 A. It would not be impossible of course. The ordinary method, however would be tamp if you wanted to replace the paving immediately make a permanent resurfacing.

Q. The ordinances of the city provide you must fill it with sand doesn't it?

A. I don't recall as to that.

Q. Don't you know of that ordinance which provides that where you excavate on a paved street you must refill with sand?

Mr. BRENNAN: That is an old ordinance that is no longer in force has been repealed some time ago.

A. I know that we did have such a clause as that when I was city engineer that on paved streets trenches were supposed to be filled with back sand or gravel.

Q. What is the consequence if when you excavate in a paved street the earth caves or gives a little under the paving at the side of the trench, it is bad for the paving isn't it?

A. It is detrimental to the paving, yes.

Q. And makes it necessary either to take out more paving or to brace the ditch or to do something to preserve that dirt intact at the top of the ditch right immediately under the paving, doesn't it if you want to have a good job.

A. Not always on all kinds of soil.

Q. In a majority of instances you must have a sufficiently good holding soil to obviate the necessity for bracing under such circumstances?

A. No, I don't believe that is exactly correct take the majority of cases. I believe the majority of trenching in the city of Des Moines for trenches five feet in depth will stand in good shape, it is my firm belief that over 50 per cent of the material will stand without bracing.

3018 Q. You don't think bracing would be necessary in more than fifty per cent of the work?

A. No, and while I have not kept any exact data on that I would not be surprised if it would run way over 50 per cent.

Q. Or might run the other way?

A. It might yes, but my judgment is it is fifty per cent or better of the soil is first class.

Q. Of course if that soil is loosened under the pavement that materially affects the pavement?

A. Yes, if it is loosened to any extent it is bound to in time affect the paving. It might not show up for eight or ten years, the pavement might wear out before that will show up.

Q. You estimated two and a half to three cents per running foot as the cost of the back filling. Now with two cents for flushing that meant from one half cent to a cent as the cost of the back filling itself, isn't that the practical result of it per lineal foot?

A. I presume so.

Q. Well don't you know?

A. If I estimated two cents for flushing and two and a half for the entire cost of back filling——

Q. Well isn't that what you said two and a half to two cents for the entire cost of back filling?

A. I was under the impression I said three cents.

Q. Well it was your estimate as a matter of fact?

A. The three cents where you do flush all your trenches would be a fairer figure.

Q. That is assuming it cost two cents for the flushing, for the cater?

A. Yes, sir.

3019 Q. Now then how many men do you require to do that work of back filling that way?

A. One man and a team will ordinarily or one man and a horse sometimes is used, that is scraper on one side and a horse on the other, sometimes where they have a large trench or large amount of work they will put a team and a man in order to facilitate the work, one man work on one side of the trench and one man on the other with a team.

Q. You take two men and a team to do the work under normal conditions don't you. You have got to have a man to drive the team and man to hold the scraper, that is right isn't it?

A. I would not state that was always under normal conditions, but it is done that way I know.

Q. Your man would be $2.25 for a day of nine hours?

A. Yes, sir.

Q. Your team would be how much?

A. Be $4.50 unless the contract- owned their own teams as they ordinarily do.

Q. Does the $4.50 include the driver or not?

A. Oh yes.

Q. That would require these men to back fill 675 feet in one day?

A. Yes, sir.

Q. Just about what your twenty men would shovel out?

A. Yes, sir.

Q. How many yards of dirt would they handle there in that day with that team?

A. That would be about 187 yards if I have not figured wrong.

Q. You divide $6.75 by that you find you are handling that dirt something less than four cents a yard don't you?

A. Yes, sir.

3020 Q. You don't want to revise your figures on that do you?

A. I don't think it is necessary.

Q. Not only handle it at four cents a yard but when you flush these sewers the dirt settles and you go over it how many times?

A. You get practically the entire dirt into the sewer with one handling.

Q. Don't it sink down after you have flushed it?

A. Certainly it does.

Q. Then don't you have to go over it again or do you leave it a hole there?

A. Perhaps be a little bit of dressing up to do. It would not be a very great amount though. The ground is ordinarily mounded up over the trench and allowed to settle into the trench.

Q. That can be done something less than four cents a cubic yard.

A. That is my judgment, yes.

Q. Now did you ever keep any figures on a job of that kind so you predicate this on some actual figures or is this just speculation?

A. This is not based on data I have of any partlcular job, just general information and mental notes I have made from time to time on general sewer work in the city. It might vary considerable in actual practice from that.

Q. When was the last time the city has bought any cement?

A. The city?

Q. Yes.

A. I don't know, they are using it right along on construction work.

Q. What did it pay for the last cement it bought?

A. I don't recall that I have any information on what it bought.

Q. Isn't that work all done in your department?

3021 A. Not all of the construction work no.

Q. Take the building of these bridges, this bridge they just finished out here on St. John's road south of my house there, what did they pay for the cement there?

A. As I recall it, that was $1.40 a barrel delivered though I would have to refresh my memory on that. I think we have a yearly contract for cement with one of the cement dealers here in the city and that would in no way be a fair criterion on what contractors are buying it for.

Q. Don't the city buy things, under the commission form of government don't they run the city on a business basis?

A. It does, but that price is entered into according to law the beginning of the year. As I understand it they advertise for bids for certain material and the low bidder is awarded that contract if a fair price at that time. Cement fluctuates up and down the same as steel and other building materials do and besides that it is possible that there are combinations formed which the city cannot break and which contractors are able to evade. The city to a great extent in my opinion is subject to certain possible combinations, that is to say I have known of contractors being able to buy material much cheaper than the city and just because the city happens to pay a certion price for cement or lumber is not necessarily convincing proof that contractors are not buying it at a less price than that because as I stated the city inherently is subject to certain combinations which they are not able to dodge or evade.

Q. Then you don't think the city can do work as economically as private contractors?

A. I think they can in spite of these additional prices for some materials they buy evade the contractors' overhead charges

3022 and profits and still do the work cheaper if the work is properly handled. You might find particular instances where the city had done work at greater expense than the contractor and on the other hand you might find dozens of instances where the work had been done cheaper.

Q. But as a matter of fact there is no detailed statement of accounts so we can tell is there?

A. There is a record kept of the total cost of these various improvements.

Q. Yes, but it is not analyzed.

A. It is not analyzed in the same way perhaps that a contractor always analyzes his costs, but yet it is analyzed in a general way so that we know whether we are doing work within reason and within the contractors' price.

Q. Now then going back you said this bridge was one of those places or jobs you worked on as giving your unit prices of the various things that went into a yard of concrete didn't you?

A. I stated that I have kept more or less detailed record of the costs of various portions of that work down there the same as I have on all work that I have had supervision of.

Q. You didn't take the actual costs then as I understand it in getting at your estimate, but you deduct something. For instance you say it would not be fair to take what the city is paying for cement to be what somebody else would have to pay for it under like circumstances.

A. I know that you can get a quotation for cement for as low as $1.13 per cubic yard on board cars.

Q. You mean per barrel?

A. Per barrel, yes.

Q. But as I understand the price which the city gets covers
3023 cost of delivery in all portions of the city. Sometimes might be a five mile delivery.

Q. Sometimes might be one block?

A. Possibly, yes.

Q. Now then you say you know you can get quotations on cement, you know that if this gas plant were reproduced it would extend over a period of one or two or three years don't you?

Q. That is my understanding.

Q. So it would not be any fairer to take prices of cement today in figuring on work like that than it would be to ask the city to take it when buying early in the year for the entire season would it?

A. It might be. The city is governed by certain fixed laws, the gas company is not. The gas company can take advantage of the market and if properly managed does take advantage of the market in materials, price of steel or cement or labor and they can build such portions of their work I take it when the market is right and if the market is materially low they could probably rush the letting of the contract for cement or other work. The city does not have the advantage of that.

Q. I don't want to discuss the legal end of it with you, I don't know this law you refer to, there may be one, but I never knew the law required the city to buy all material at one time, but whether there is or is not, I don't think makes any difference. Now then you said there was an abundance of sand and gravel could be obtained now from the river.

A. And for the last two years practically have been.

Q. That is when the river has been very low?

A. Yes; you may say abnormally low.

Q. It is an abnormal condition you base your statement
3024 on?

A. That is based on present conditions or for the last

year or two and it is possibly to a certain extent abnormal. That would not cover the entire year. There are certain periods of the year when the river is up and you can't get out sand and gravel. Then you have to buy from the sand pumps. On the other hand there are certain times of the year when the low water exposes the sand and gravel bars so you can get all the sand and gravel you want from the river without buying from the sand pumps.

Q. What experience have you had putting in concrete foundations?

A. Buildings?

Q. What buildings?

A. Do you mean for buildings?

Q. Yes.

A. I don't recall that I was ever personally in charge of any building foundations.

Q. Now you said concrete had been mixed and placed at 50 cents. That was on what sort of a job?

A. Well it would cover a very wide range of work. That is to say I have had authentic reports of mixing and placing on say buildings of this type over here for as low as 25 cents per cubic yard.

Mr. BRENNAN: You mean the Hewitt Hotel when you say over here?

A. Yes; the hotel over here in this block.

Q. When you say authentic reports do you mean persons who done the work or that you read something of that kind?

A. When I say authentic reports I mean my engineering journals which I regard as authentic reports if the reports are given in such shape and by such engineers in charge of the work that they appear to have had access to the actual facts.

Q. Have you any experience in your own work where it has been done at that figure, 50 cents?

A. Yes.

3025 Q. Where was it?

A. If you won't again object to my referring to the Walnut street bridge.

Q. Well that is not what I call your own experience.

A. Well if you bar an engineer from giving his experience where that has been done directly under his charge as a representative of the party that is paying for it, it would bar an engineer from a great deal of——

Q. I don't understand that on the Walnut street bridge you have actually analyzed accounts of the actual expenditures, is that true or isn't it?

A. I have as——

Q. Have you as a matter of fact had actual analyzed accounts on the Walnut street bridge or not?

A. I have had what purports to be the actual statements of cost for labor and wear and tear on machinery and all other items that enter into the cost of mixing and placing concrete there and I have no reason to believe that the contractor willfully misinformed me

in regard to facts which did not lie within the possibility of my own verification such as wear and tear on the machinery and the salaries that he was paying his foreman in charge of the work and so far as I was able to verify his statements his statements were all correct those that I did verify. For instance when I asked him how much he paid——

Q. He told you how much it cost him?

A. No, sir he did not.

Q. Did you get it from the books?

A. No, sir. I asked him the unit costs of certain items such as how much per day he was paying common labor, how much for foreman, how much for the men that were operaitng the
3026 mixing machine and how much his wear and tear on the machinery would amount to and the price that he was paying for sand and gravel and for stone and for cement delivered on the job and all of these items that I was able to verify I did, such as the item of what he pays the common labor, that is a very simple matter to verify that by asking the laboring men and the cost of getting sand and gravel that is let by sub contracts to——

Q. We are talking about labor incident to putting this stuff in place, you have got on to materials.

A. I stand corrected on that. The matter of keeping tab on the number of cubic yards of material that goes into a day's run is a very simple matter, that is measuring up the actual concrete we have placed when we get through at the end of the day and recording how many men working on that job in connection with mixing and placing is a simple matter. The item of wear and tear on the machine that he uses of course I relied on his statements as I say not working for him and did not have occasion to make up his records on that.

Q. Did not include forms?

A. Mixing and placing don't include forms, no sir.

Q. Nor labor on forms?

A. No, mixing and placing is a separate item from forms.

Q. Now you said this work such as this work in the purifying house here was usually done by ramming it hard and taking the forms right off of it so you could use it immediately for the next section. Give us some instances of jobs where it is done that way?

A. There is a piece of coping being placed at this time in front of the new municipal building on east Second and Locust street-
where that process is being used. Coping there about, I
3027 should say eight inches wide and possibly a foot high.

Q. Laying it in thirteen foot sections and moving the boards just as soon as the concrete is poured so as to not stop the concrete mixer?

A. No, I don't hardly think they are laying it in thirteen foot sections or anything in that nature, but simply done——

Q. How long is the concrete set in place before the forms are removed?

A. It is not necessary to leave it in there more than——

Q. I didn't ask you that, how long is it set as a matter of fact?

A. On that piece of work over there?

Q. On that piece of work?

A. I have not been over there today all the time, but I know I went over by there at noon and a piece of work they had completed during the forenoon had been stripped. Green cement constituting their forenoon's work that had been stripped already. I have seen time and again coping work such as work around lawns which is in the same class of work, thin walls from a foot and a half to two feet in height and the concrete dropped and tamped into that and rammed good and hard and removed immediately. It is just the same as tamping damp earth into a form and removing the mould.

Q. Is this work you have been talking about seeing done water tight work?

A. I don't know for I never had occasion to test it to see if it was.

Q. Do you know whether this work at the purifying house is?

A. I don't know, if it was not naturally water tight it could be made water tight by either treating afterwards or adding water proofing compound to the material as it is mixed.

3028 Redirect examination by R. O. BRENNAN, Esq.:

Q. You spoke about the cost to the city for carrying on some of its public improvements. I will ask you if you recall any variation between the contract price and price at which the city did the work for the grading on west Seventh street from Grand Avenue to Chestnut.

Objected to as irrelevant and immaterial wholly.

A. I recall many instances where the work done by the city showed up much cheaper than that done by the c-ntractors and for instance now this bridge that has been referred to several times St. John's bridge. I was asked by a contractor what it cost us to build that and he commented on the low price in comparison to what they ordinarily got. As I stated before there might be an instance here and there where the price would range higher than the contract would.

Q. I was just calling attention to that street if you recollect that?

A. Yes, I do recall that particular instance as a very wide range in favor of the city.

Q. Now do you know what the Des Moines Gas Company pays its laborers?

A. No, I do not.

Q. Do you know whether they pay them as much as $2.25 a day for nine hours' work?

A. I do not.

Q. The city's employés work how many hours a day?

A. Eight hours.

Q. Now you stated in to tell something about the item of the wear and tear on tools entering into the cost of mixing and

3029 placing a cubic foot of concrete you said it was inconsiderable. Now just how much of a factor is it, that item?

A. You take a mixing machine such as the city uses for small bridge work, sidewalk work and such concrete work as we do and that cost originally probably $350 as I recall. That has been in use three years and according to my information on that has been I think something like $150 of repairs in that time.

Q. In how many years?

A. Three years. Now that machine has been going pretty constantly for the greater portion of the time during the construction season which lasts six months. It is not operating continuously on any one job from morning to night because the nature of the work very often is such that the men will shut down the machine and do form setting or something of that nature while the machine stands idle, but even suppose that machine had been worn out and was in the scrap heap now there is an item of $350, then you have for shovels and wheelbarrows and some lights so that the average amount of machinery and tools used by a construction gang of say fifteen men would perhaps run to $450 and ordinarily that would last fully three years, in all probability a great deal longer and in that time if they were working day after day say six months in a year they would put in one hundred and fifty days of labor so that would be four hundred and fifty days' labor and that gang of fifteen men with a type of machine like that could turn out seventy five yards of concrete.

Q. In what length of time?

A. In eight hours.

Q. Is there anything complicated with respect to the operation of one of these mixers?

A. No, it is simple, the ordinary foreman seems to be able
3030 to pick it up.

Q. Require any high grade mechanics to operate it?

A. No.

Q. Do you know whether they have on the market small portable concrete mixers for small jobs?

A. Yes, they have small portable mixers micing as small as three or four cubic feet to the batch and easily hauled around. Take for instance this mixer that the city used when we are laying sidewalks they set it right in the middle of the sidewalk on a couple of two by eight planks and they run a certain amount of concrete through there and place it back at the back end of the machine, shovel it right into place and when they have laid a section say as long as a two by eight plant sixteen feet long the machine is run forward on to other planks by the men in charge and it does not take but two or three minutes to remove the machine either. That is not the smallest type of machine on the market and with the modern types of machinery that have been perfected and put on the market within the last two or three years, the cost of mixing and placing concrete in small work has been brought down very close to mixing and placing on large work where you have a chance for organizing and operating a large mixing plant and practically all sidewalk and curb contractors now use small portable mixers and move them many times a day.

Q. I wish you would tell us what general data you have collected with regard to the unit prices entering into concrete construction.

A. The item of labor of course ra*b*ges very widely in favorable conditions as I stated it will be mixed and placed for less than 50 cents and you will sometimes under difficult situations—it will run to a dollar a cubic yard though that is not likely with ma-
3031 chine mixing, that is more likely to be the case for hand mixing. The cost of sand and gravel and crushed stone I have had occasion to verify many times in the last month by personal inquiry of the material men that sell those materials and cement the same way. For instance just a few days ago I had occasion as a member of the committee for the Hyperion Club to get prices of cement delivered at the Hyperion Club site and got a price of $1.13 a barrel out there on the Interurban.

Q. Where is that located, how far from the court house?

A. Eleven miles from the court house and takes a fifteen mile haul on the Iowa freight tariff.

Q. Can you tell the Master at this time what Mr. Wheeler is paying for labor on the bridge, that is that class of labor which has to do with the mixing and placing of concrete.

A. He is paying or was the last time I asked him some two weeks ago, 20 cents per hour for general labor on the bridge, common labor such as is used for mixing and placing concrete.

Q. How many hours constitute a day's work?

A. Ten hours, $2.00 per day.

Q. You spoke of having done some work in Gilman Park Addition. Was that work which the city did or which the persons who platted that addition had done by private contract?

A. That was work done by the owners of the addition by day labor and I was the foreman in charge of the construction work and did all the work of checking materials brought on the job and keeping time, staking out the work and running the work myself just the same as though I had been the contractor.

Q. And that work involved grading did it?

A. It involved the excavation of the trench for the curb.
3032 Q. And the construction of the curb?

A. Yes, and the back filling.

Q. Preparing the roadway for the paving?

A. No, I did not have charge of the paving work. That was done under another contract and my work on the paving was of a general nature. That is to say I recommended the type of paving that was adopted and the plans and specifications were prepared under my recommendation and then the contract was let and work done under city inspection.

Q. What is the fact as to these public contractors who are entitled to partial estimates from time to time as the work progresses whether they have in the past which has come to your knowledge filed the pay rolls and the contracts for the materials which have been used in connection with the work and in that way have you become familiar with the cost of labor and material?

A. The matter of filing pay rolls and estimates of material, that is receipted bills for material is one of the requirements on general contract work where they get estimates and those of course have afforded opportunity to get data in regard to cost of material as those were filed and then occasionally on some work I have had access to the contractors' records to a certain extent, that is to say most contractors whose work I have inspected when they are asked for the cost of certain materials have been very free to give me their records of costs, that is to say receipted bills for material. For instance if I wanted to know what steel was costing I have never yet found a contractor who would refuse to show me his bills for material and those are the ways in which I have secured a great deal of the date in regard to cost.

Q. So that you have in connection with your duties fa-
3033 miliarized yourself in that way and kept in touch with the market prices.

A. Yes, sir.

Q. Of labor and materials?

A. Yes, sir.

Q. Now are you called upon from time to time and have you been called upon in connection with your duties as city engineer to prepare and submit estimates of the cost of curbing for instance along streets?

A. Yes, while I was city engineer that was one of my duties.

Q. In making up those estimates for the benefit of the city council what factors were necessary to be considered by you in connection therewith?

A. The location of the work distance of haul, length of haul from the source of supply of materials, the amount of excavation involved and the character of the soil, etc., that would be encountered.

Q. What is the fact so far as you have observed as to the extent which the gas company has laid mains either before the streets were paved or at a time when they were being repaved? Tell us in a general way.

Objected to as irrelevant, immaterial because not asking for present conditions.

A. My recollection of that is that the major portion of their mains that have been laid during my connection with the city were laid on unpaved streets. I do not at this instant recall very many cases where they lifted the pavement.

Q. Since you went in as city engineer in 1906 as I remember your testimony this morning?

A. Yes, sir.

Q. And from that time up to the present Court Avenue
3034 from the river to the Court House, Walnut Street, Locust street and a great portion of Grand Avenue has been repaved and the pavement has been reconstructed during that time?

A. Yes, it is a fact that the west Des Moines business district has practically been repaved since 1905 complete. There are very few

pavements in existence in the business district that were laid according to my recollection prior to 1905.

Q. Do you know about how many times Walnut street from the river, that is in West Des Moines, from the river west to 15th street has been paved or repaved within the last ten years?

A. Well it was repaved with asphalt from Second street west as I recall it in 1905. That extended as far as Tenth street I believe.

Q. What was the character of the pavement just preceding the placing of the asphalt on the street?

A. That was brick pavement.

Q. And do you know how long that brick pavement had been down?

A. Not from personal knowledge that is, I do not recall. Of course the records at the engineer's office show.

Q. Do you know whether the street was at one time paved with cedar blocks?

A. That is what the record shows.

Q. Is that true as to the other streets?

A. Very many of them were paved with cedar blocks.

Q. Was brick afterwards substituted and then asphalt or creosoted wood block substituted for the brick?

A. Yes, sir.

Q. Now with regard to these improvement certificates they are delivered to the contractor in full payment for his work and where the property owner waives of course they are certified up to
3035 the treasurer?

A. Yes, sir.

Q. And collected by the County Treasurer each year in seven annual installments?

A. Yes, sir.

Q. So that the contractors as a rule have been in the habit of selling these securities?

A. Yes, sir.

Q. Have you made any observations with respect to the manner in which crossings are constructed under street railways or steam railways for the purpose of laying pipes or mains?

A. Not to any extent I could not state that I have carefully observed that is except for sewers. For a sewer ordinarily——

Q. There you have to go some depth?

A. Yes, that is a deeper excavation so they can tunnel/ without any difficulty so the width of a street railway track that interferes is only about seven feet or such a matter and for a sewer ten feet deep it is a very simple matter to tunnel under it.

Q. Have you seen them place underground conduits under street railway or steam railways, or have you seen them construct trenches for the purpose of laying gas pipes or water pipes under street railway crossings?

A. I have seen all those operations, but do not recall any unusual feature about them that attracted my attention at the time.

Q. I want to ask you in a general way where a trench is to be excavated to a depth not to exceed five feet could you see any real

occasion for bracing or sheeting in a trench of that size where it is say from eighteen inches to three feet in width and not exceeding five feet in depth?

3036 A. As I have stated a majority of the soil that has come under my observation in the city is such it would not require bracing or sheeting for the depth of trench.

Recross-examination by N. T. GUERNSEY, Esq.:

Q. Do I understand you to say that on the Walnut street bridge they are paying $2.00 a day for ten hours for ordinary labor?

A. That is the last report I had from there.

Q. And what is the city paying for the same kind of labor?

A. I believe the city pays 25 cents per hour—no it is more than that it is $2.25 for eight hours, that is about 28 cents.

Redirect examination by R. O. BRENNAN, Esq.:

Q. Do you know what the ordinary contractor pays for teams?

A. For hiring teams?

Q. A man with a team to do back filling or any work along that line of work?

A. When they hire a man with a team at the present time they pay about 50 cents an hour. Sometimes less than that under certain conditions, as a scarcity of labor, but 50 cents an hour would be a fair average price.

Witness excused.

3037 JAMES PARKER being called on the part of the defendants and sworn and examined — chier by R. O. Brennan, Esq., testified as follows:

Q. Where do you reside?

A. Des Moines, Iowa.

Q. How long have you lived in this city?

A. About 22 years.

Q. What is your official position at the present time?

A. Assessor city of Des Moines.

Q. How long have you been assessor for the city of Des Moines.

A. About three years and a half.

Q. Were you formerly employed in the office of the auditor of Polk county, Iowa.

A. Yes, sir.

Q. And in what capacity and for what length of time?

A. Deputy in charge of the revenue department for about seventeen years, not all that time in charge probably, about twelve or fifteen years in charge of it.

Q. During that time, Mr. Parker did you become familiar with the assessed values of real estate in this city?

A. That department has charge generally of the assessors of the county while we did not particularize at all or specialize in any way we had the overseeing of the work.

Q. You prepared the tax lists for the county treasurer through your office.

A. Yes, personally.

Q. And using the valuation returned by the assessor for the purpose of making up these lists?

A. As equalized, yes.

3038 Q. And from that general experience did you in a general way become familiar with the assessed valuation of the real estate?

A. Yes, sir.

Q. And you have been the city assessor for the past three years or more?

A. Yes, sir.

Q. And during that time have been called upon to make valuation of real estate for the purpose of taxation in the city of Des Moines?

A. Yes, sir.

Q. As assessor of the city of Des Moines, Mr. Parker, have you assessed the real estate in the vicinity of the manufacturing plant of the Des Moines Gas Company?

A. Yes, sir.

Q. And do you recall the years in which you made such an assessment?

A. 1909 and 1911.

Q. So that you have made two assessments on that property and the property in the immediate vicinity?

A. Yes, sir.

Q. You have prepared and produced a plat which the reporter has marked defendant's exhibit No. 29 and I wish you would tell the Master what that plat purports to represent and from what source the information which it purports to give was secured?

A. It shows the assessed value of property from the alley north of Locust street to Raccoon street on the east side and from the river to the west line of Fifth street.

Q. And when was the assessment made from which these figures were taken?

A. 1911.

3039 Q. Does the plat defendant's exhibit No. 29 show the location of the real estate of the Des Moines Gas Company?

A. It does, yes, sir.

Q. And the amount at which it is assessed or was assessed the year 1911?

A. Including all property owned and taxable in the city, yes.

Q. And are the figures shown upon that plat, do they represent the value of the real estate exclusive of the buildings or improvements or do the figures represent the valuation as found by you for the purpose of taxation of the property including buildings and improvements?

A. They include buildings, improvements and all property of the company, mains.

Q. Take the property immediately north of the manufacturing

plant of the Des Moines Gas Company being the property abutting east Court Avenue from First street up to the point indicated by you as shown on the plat and tell the Master the range of prices for valuation as shown by the plat?

Objected to as immaterial, incompetent, the valuation of property for the purpose of taxation is not competent or material on an inquiry such as is here presented nor is such a valuation of other property than that involved in the controversy material.

A. They seem to run from $2,200 upward per lot of 44 feet. This would include improvements.

Q. Including improvements?

A. Yes, sir.

Q. Now in order to get it on the record does the plat, defendant's Exhibit 29, show the block and the number of the block and addition in which the property is situated?

3040 *Q.* It does show the block number, lot number and dimensions in feet of the lot or tract of land assessed.

Q. Now take the property, and you may describe it as shown by the plat lying immediately east of the gas company's property and tell the Master what the valuation of the property is as shown on this plat?

Same objection.

A. Immediately across the street east the lowest valuation I see is $1,500. There is a little increase until you get to Fourth street and there it decreases.

Q. $1,500 what do you mean by that?

Same objection.

A. 66 foot lot.

Q. 66 foot frontage on what street?

Same objection.

A. On Second street.

Q. What is the depth of the lot?

Same objection.

A. 132 feet.

Q. Do you have in mind the particular property which that plat describes?

Same objection.

A. I do not, no sir.

Q. You don't know the character of the improvements at this time on the lot?

Same objection.

A. I do not, no sir.

Q. They run from $1,500 a lot up to how much?

Same objection.

A. $2,000, well there is the buildings, that one up to $7,500 a lot.

3041 Q. Where is that valued at $7,500?

Same objection.

A. Northwest corner of Market and east Third, $15,000 on 132 feet square.

Q. The northwest corner of Third and Market and do you know what that property is or whose property it is?

A. No, I don't recall what it is.

Q. Can you take the map which is complainant's Exhibit No. 6 in connection with your plat, defendant's exhibit 29, and tell us what property is located at the northwest corner of Third and Market street.

A. Nothing seems to be marked here. I don't recall that that is.

Q. I will ask you this Mr. Parker, if the plat, defendant's exhibit No. 29 correctly shows the property adjacent to that of the Des Moines Gas Company and correctly shows the numbers of the lots and the blocks and correctly shows the valuations placed upon the respective properties for the purpose of taxation as made up by you for the year 1911 as city assessor?

Same objection.

A. It does, yes.

Q. When was that plat prepared by you Mr. Parker?

A. Some three or four weeks ago. Just the week that this hearing was adjourned the last time.

COURT: This don't show the valuation of these lots separately?

A. Not unless they were assessed separately.

COURT: It shows the valuation of the whole block?

A. I don't think there is but one block th-re, that belongs to the gas company and that includes all property in the city, made one assessment for the entire property in the city, did not attempt to distribute it.

3042 Q. Does this show the gas company's property.

A. It does. I think it is Block F is it not. The valuations are placed on block C I think and all other property was marked assessed with Block C.

Q. That is to say now you did not take up the property in Block M or Block T Scott & Dean's Addition and show that separately upon this plat?

A. No, sir. Well no separate valuation was placed on it, it was all lumped.

Q. Just where on the plat Exhibit No. 29 is the gas company's property shown?

A. You mean their assessment?

Q. Yes.

A. Their assessment is shown on Block C Scott & Dean's Addition.

Q. And how much is it shown to be?

Same objection.

A. $1,350,000.

Q. And that includes all of the real estate owned by the Des Moines Gas Company?

Same objection.

A. Yes, sir; fixtures and mains.
Q. Manufacturing plant?

Same objection.

A. Yes, sir.
Q. Manufacturing plant and everything of that kind?

Same objection.

A. All their property yes.
Q. I notice some property lying immediately east of Block C indicated as being in Block K lots 5, 6, 7, 8, 1 and 2, seem to have the valuation placed on each lot separately. Do you know
3043 whether that includes the gas company's property in whole or in part?

Same objection.

A. I don't know what property the gas company owns. The gas company furnished me a list of their property and no assessment was extended on any of that property but was extended against Block C as a single piece of property including all the others. I could not answer it because I don't know their itemized list of property, haven't looked at it since.

Q. Take the property in Block 17, lots 1 to 10, both inclusive, I notice on east Vine street the figures 150. Does that indicate the frontage on Vine street?

A. Yes, sir.

Q. And the figures on the plat on Lot 1 of 56 feet does that represent the frontage on Fourth street?

A. It does, yes. The ink figures represents dimensions and lot numbers. The lead pencil figures represent values.

Q. In Block 17 to which I call your attention there are a number of figures in ink 6400 for instance. Lot 2, and they represent the valuation of the lot for the purpose of taxation?

A. Well I will have to correct my testimony, I thought I had the valuation all down in lead pencil but the valuations are there in ink if written across the face of the lot. The ink figurnes on either margin of the lot are the frontage.

Q. So that this plat, Mr. Parker shows the lot and block, the dimensions of the lot or lots and the valuation.

Same objection.

A. Yes, sir.
Q. That was placed on the lot for the purpose of taxation?

Same objection.

A. Yes, sir.

Q. I wish you would give these boundaries embraced within
3044 this district by streets so we can have it here on record?

A. The map covers the territory from the alley north of Locust street to Raccoon on the south and then for a little ways a souple of blocks further and from the river eastward I think to Fifth street.

Q. You say that was a true correct representation of the district and description of the lots, dimensions of the lost and the respective valuations?

Same objection.

A. Yes, sir.

Q. Made against the same?

Same objection.

A. Yes, sir.

Here the further hearing was adjourned until 9:30 o'clock tomorrow morning.

3045 Tuesday Forenoon Session.

SEPTEMBER 12, 1911, at 9:30 a. m.

Counsel for the respective parties all present.

Testimony on part of Defendants resumed as follows:

JAMES PARKER, Continuing his direct examination, examined by Mr. Brennan, testified:

Q. Now Mr. Parker, in using the figures which you have used on Defendant's Exhibit 29 to indicate the values of the properties shown on this plat for the purposes of taxation, I will ask you from what source you secured the data or information which appears upon the plat?

A. Well, those assessments were made by a deputy and we worked all together and attempted to get the valuation of the property by any source we can obtain as to real estate values, by inquiring among real estate men as to sales and mortgaging and offers of sales.

Q. What I wanted to know more particularly, Mr. Parker, was if the figures which are shown upon the respective lots indicated on this plat, Exhibit 29, are compared with the figures which appear on the original assessment rolls?

A. Yes, sir; they are copied from the assessment roll of 1911.

Q. And did you personally check them up to ascertain if they were correct?

A. Yes, sir. I did. I made the figures and read them back.

Q. I understand you to state that the valuation which is placed upon the property of the Des Moines Gas Company, as shown upon this Exhibit 29, inclusive the real estate, the buildings and all property, both real and personal, of the Des Moines Gas Company situated in the city of Des Moines, Iowa?

3046 A. It does, yes, sir.

Q. Does that include the Valley Junction property?

A. It does not. It includes the mains to Valley Junction, but not property outside of the limits.

Q. So that the valuation extends over the distribution system as well as over the other property?

A. Yes, sir; it does.

Defendants now offer in evidence Exhibit 29, identified by the witness.

Objected to on part of complainant as being immaterial and incompetent and does not tend to establish the value of the property which would be the basis of the calculations of the return.

The MASTER: Will you tell me under what section you made this valuation?

A. There is a special number—I can't tell you the number just now.

Judge CARR: It is 1323; and there is 1343 that has special provisions as to gas companies.

Mr. BRENNAN: We had better have the bailiff bring in a Code, so that there will not be any misunderstanding.

Cross examination by W. L. READ, Esq.:

Q. What is your age, Mr. Parker?

A. Forty-two.

Q. You have been assessor of the city of Des Moines for how many years?

A. Three years.

Q. You were in the auditor's office of the county prior to
3047 that?

A. Yes, sir.

Q. For how many years?

A. About sixteen or seventeen years.

Q. What had you been prior to going into the auditor's office, what had been your occupation?

A. I had been book keeper for a short time.

Q. Had that been your calling up to that time?

A. Yes, sir.

Q. You had never dealt in real estate or given any special attention to the values of real estate?

A. Not as a business, no sir.

Q. In the auditor's office, what were your particular duties?

A. In the revenue department, making up the tax lists.

Q. That involves the compilation of the tax list from the assessment rolls returned by the assessor?

A. Yes, sir; and since the Code of 1907 the auditor's office has had a sort of an advisory capacity over the assessors of the county.

Q. Since you have been assessor of the city of Des Moines you have had a number of deputies under you?

A. Yes, sir.

Q. How many?

A. About twenty making assessments.

Q. Those deputies are appointed by whom?

A. By myself.

Q. Has it been your practice to appoint men who have engaged in real estate transactions and with special knowledge of that subject?

A. We try to get men with special knowledge of the subjects of assessing and valuations, yes sir, but did not pick out real
3048 estate men.

Q. Will you name some of the deputies?

A. Mr. Higgins, Mr. Voodry, Mr. Campbell, Mr. Montis——

Q. That will do for the present. Now, Mr. Higgins is in what occupation?

A. Gardner and farmer, living in the city.

Q. Mr. Montis is engaged in what occupation?

A. He is an insurance man, an appraiser.

Q. What do you mean by that term, appraiser?

A. Appraiser for the losses.

Q. Mr. Campbell is engaged in what occupation?

A. Mr. Campbell is a retired man; I don't know what his original occupation was.

Q. The other one, Mr. Voodry, what is he?

A. He is a farmer.

Q. Are the four typical of the list of twenty men?

A. Yes, sir; there might be better men I would like to add if you are asking for occupation. All of these men have served for from five to fifteen years as assessor; I do not give that as the occupation as that is not a continuous job.

Q. There has been in the city of Des Moines rather a marked advance in real estate values, inside business property?

A. Yes, sir.

Q. It has been difficult, hasn't it, to have your valuations for taxation keep pace with the real advance or commercial advance in the values of property?

A. It has, yes sir, when it comes to the prices paid in certain districts.

Q. In assessment for taxation, the values for taxation have dragged behind the real advance, haven't you, you have not been able
3049 to have your valuations for assessments coincide with the rapid advance in properties, have you?

A. We do not aim to make our assessments up to the value, the selling price of property where this element of speculation enters into it.

Q. Well, regardless of that, you haven't been able to advance your valuations for taxation purposes and keep pace relatively with the advance in values, have you?

A. Well, it is rather difficult for me to know how to answer that, except in the way I did. Our valuations in the residence. Our valuations in the residence district we think are up to the selling price; but in this business district the price at which properties sell we do not reach in taxation.

Q. The thought I had in mind was this: that the assessments have been made every two years; you started out years and years ago

with a low valuation, because property values have been low in Des Moines, and you started out at a time when the valuation for assessment was only a percentage of the real value, didn't you?

A. In the past, years ago, yes sir.

Q. It has been difficult, hasn't it, to advance the valuation for taxation to the point of the actual value owing to the practice in the past?

A. No, there is no difficulty in bringing it up if we could ascertain or determine that the selling price of today is the actual real value of the property, not considering that element looking towards the future growth of the city. Of course our assessment made in 1911 would be two years behind under any circumstances; we could jerk it up.

Q. You could do it, but are you able to practically, do you succeed in doing that?

3050 A. We succeed to the extent we intend it.

Q. You only intend to express a part of the advance that has occurred, or may have occurred within that two years or in prior years?

A. Yes, sir; as I stated, we aim to be as far under as the element of reproduction or future growth may enter into the real estate.

Q. So that it is true, then, in the main, that your valuations for taxation do not reach the level of the real or commercial value in inside business property at least?

A. In the business property, yes sir, that would be true, and would be true in a different ratio in different places. I might illustrate that with Tenth and Locust. I estimate our assessments are about 60 or 70 per cent of the today selling price, while at Second and Locust—Second and Walnut, I should say—they are within 85 or 95, the element of speculation being much greater in some places than in others.

Q. For instance, what is the valuation for taxation upon the Fleming Block?

A. The valuation fixed by me was $430,000, and it was reduced by the board to $384,000.

Q. Now does that include both improvements and real estate?

A. Both, yes, sir.

Q. Are they separated?

A. They are, yes sir.

Q. What is the real estate?

A. Well, it is a little hard—the real estate is $140,000.

Q. What frontage is there there?

A. 66 feet.

Q. That property is located on the corner of Walnut and Sixth Avenue?

A. Yes, sir.

3051 Q. The southeast corner?

A. The southwest corner.

Q. The improvements then according to that would be valued at $244,000?

A. What did I say the real estate was?

Q. $140,000.

A. Well it was $138,000.

Q. This valuation was placed by you—you valued the property in the first place?

A. I valued the property at $430,000 and it was reduced; my valuation of the building was $290,000.

Q. We do not care about that now. Did you know what the improvements cost?

A. I have heard it variously estimated, yes sir.

Q. Have they been by persons who knew?

A. I never can tell who knows.

Q. How nearly does the figure $240,000 coincide with the cost of the building?

A. It is my information from what I have heard in business circles that the building cost $350,000 and a little upward, I have heard.

Q. The building is a new one, erected within a few years?

A. Yes, sir.

Q. And is a very substantial one?

A. Yes, sir.

Q. Of fire-proof construction?

A. Yes, sir.

Q. Now, the 66 feet of real estate, the valuation of $140,000 is about $2,100 per front foot; do you think that coincides with the commercial or market value?

A. Not taking into consideration the selling speculation.

3052 Q. This valuation is the one made in 1911?

A. Yes, sir.

Q. The property is worth considerable more than $140,000 the ground would be at this time?

A. It would sell for more, yes.

Q. Sell for $3,000 a front foot, or $3,500?

A. I wouldn't put it $3,500; I would say if the ground was clear it would sell for $3,000.

Q. What is the valuation for 1911 of the Citizens Bank Building on the northeast corner?

Objected to on the part of defendants as irrelevant, immaterial and not cross examination.

A. The ground and building, $210,000.

Q. How much for the building and how much for the ground?

A. The ground $90,000; and the building $120,000.

Q. What frontage is there?

A. 44 feet on Walnut street.

Q. That valuation upon real estate is about $2,000 a front foot?

A. Yes, sir; $2,000.

Q. The real present commercial value would be as much as $3,000?

A. It would, yes sir.

Q. Do you know what the building cost?

A. I have been told—I was trying to think—I was thinking it was somewhere in the neighborhood of $130,000 to $140,000; I have forgotten.

Q. At any rate you are satisfied these figures do not coincide with the cost of the buildings?

A. With the Fleming, yes sir; I would not say so with the Citizens National Bank Building, with the exception of $10,000 or $15,000.

Q. What do you mean by that, Mr. Parker?

3053 A. The valuation we placed on the Fleming Building is not its cost, but the other one I think is about its cost.

Q. About $120,000?

A. About $120,000; I think so.

Q. Do you know where the Pritchard property is, on the corner of Eighth and Walnut?

A. Yes, sir.

Q. And the Foster property?

A. Yes, sir.

Q. Do you recall what the valuation for taxation has been upon these properties?

The defendants interpose the same objection last above made, and the further objection that the property inquired about on cross-examination is in an entirely different section of the city from that inquired about on the examination in chief, and therefore is incompetent.

A. I brought my book; I can tell you, it is $75,000.

Q. Each?

A. No, the Pritchard corner is $75,000.

Q. And the other corner?

A. $80,000.

Q. Referring your attention to the Foster property—you know that has been recently leased for a term of years?

A. I know it has, yes sir.

Q. Ninety-nine years is your understanding, Mr. Parker?

A. I have not the terms of the lease yet.

Q. And has been leased on a valuation of $200,000?

A. The Foster property?

Q. Yes, sir.

A. I don't know.

3054 Mr. BRENNAN: Let the record show that these objections are made to all this line of cross-examination, because it relates to an entirely different section of the city than the property in question.

The MASTER: This objection may apply to all the cross-examination.

Q. You also know the Pritchard property has been lately leased for a term of ninety-nine years or some long period on the basis of a $200,000 valuation.

A. I do not know, because we pay no attention to those leases at all until we run down the parties and we have not done that since we closed up our work this year.

Q. Now the valuations you have given in response to the inquiries are fairly typical of the valuations on Walnut Street?

A. They are in that section, from Fifth street to Tenth street, yes sir.

Q. How is it from Fifth Street east?

A. They are much closer to the real selling price of the property.

Q. And there you think they reached what per cent of the real selling value?

A. Oh, they will reach 85 to 90 per cent on Walnut Street, that is, passing Fourth.

Q. That is of course your judgment?

A. Yes, sir.

Q. On the east side, take the Capital City Bank Building, what is the assessment upon that?

A. $130,000.

Q. How nearly does that coincide with the actual selling price, commercial value?

A. I have never heard any figures except those my own
3055 men computed as to the buildings, so I could not reply as to the building itself. The ground value, in the way I know men are carrying the property is perhaps in the neighborhood of 75 or 80 per cent of the value of the vacant ground.

Q. This figure you are giving is the value of the ground and building?

A. Yes, sir.

Q. $130,000.

A. Yes, sir.

Q. And the valuation as placed on the building, what is that?

A. I neglected to take that; that was in another district.

Q. The property just diagonally across the street, the Coberger property, which Mr. Teachout has purchased, what is the valuation of that, can you tell?

A. I can not tell you off-hand, no sir.

Q. Can you recall approximately?

A. Why it is a little over a hundred thousand dollars, I don't remember just what. This is simply a record for the west side.

Q. Just precisely what is shown by that Exhibit 29; what do you purport to show?

A. The blocks, the lots and the streets.

Q. With respect to valuation I mean?

A. I show here the valuation as placed by the assessor for assessing purposes for 1911.

Q. That valuation was made when?

A. Some time in January, February or March of this year.

Q. The value of the ground and improvements are not separated on that?

A. Not on this, no sir.

Q. That valuation was made not by you?

A. Why the valuation was not made by me, but was passed on by me after it was made, lot by lot.

3056 Q. Was that for comparative purposes or for valuation purposes?

A. More to see that the valuations corresponded with my ideas. I check up every real estate valuation in the city that way.

Q. Will you turn to the property on Court Avenue, on the northeast corner of First and Court Avenue, the Bailor property, used to be, and tell us what the valuation placed upon that is?

A. $13,000.

Q. How much frontage is there?

A. 132 feet square.

Q. That is the property lately purchase- by the Bently-Olmsted Company?

A. I do not believe they purchased it; the Ills own it.

Q. That is the property that Lorenz Ill Company is building upon and renting to the Bently-Olmsted Company?

A. Yes, sir.

Q. Do you know upon what valuation?

A. I don't know. I know what valuation they paid for it. I don't know the terms of their lease.

Q. Don't you know that it is upon a valuation of some $220 a front foot?

A. I do not; all I know is the purchase price of the Ill property.

Q. The property across the street, the McDonald property, the Des Moines Manufacturing and Supply Company, what is the valuation upon that?

A. You mean the whole half block?

Q. Yes.

A. $28,800.

Q. That includes the improvements as well?

A. Yes, sir; but not the machinery or fixtures—I mean the machinery or merchandise.

Q. In short, the figures and valuations placed upon the
3057 property shown by Exhibit 29 are such as were placed by the deputy making the list of the property, but examined by you afterwards and approved by you?

A. Yes, sir.

Q. How much of an advance, if any, is made over the previous assessment on those properties?

A. Do you mean individual properties?

Q. As shown by Exhibit 29, has the assessment of them been increased?

A. In some places, for instance on Locust street there was an increase on the neighborhood of 25 per cent. Walnut Street was unchanged because of the closing of the bridge. Court Avenue was perhaps not to exceed a ten per cent raise.

Q. How about Vine Street?

A. From Vine Street on south there was no change.

Q. You say Vine was not changed on the south?

A. No, sir.

Q. Is that true of the whole extent of Vine Street?

A. Oh, yes.

Q. How about Market Street?

A. No change.

Q. There has been a marked advance of properties on East Locust Street since the opening of the bridge?

A. There has been up to Sixth Street, yes sir.

Q. Up to the location of the civic center?

A. Yes.

Q. That would affect Walnut Street also, but you did not make any advance because of the temporary closing of the Walnut Street traffic?

A. Yes, sir.

Q. You have made a slight advance on Court Avenue?

3058 A. Yes, sir.

Q. In all instances or in some only?

A. Well the advance would be on the real estate.

Q. Not on the buildings?

A. No, we do not advance the buildings.

Q. Well, these valuations shown by Exhibit 29 are aimed to be conservative, low?

A. I wouldn't say low, no sir, but they are aimed to be conservative.

Q. They do not probably express the present actual selling value?

A. They do not in any place where there is a demand for property as a business property, they do not represent the present selling value.

Q. By business property you mean for manufacturing or storage or any such uses as that?

A. Yes, sir; where there is a good demand for it.

Q. Do you know what the basis of valuation is of the properties shown by Exhibit 29—I mean how the assessor reached the conclusion that the figures placed by him were correct?

A. Well, we have a system in the office of collecting and tabulating all values, and that is furnished to the field men and they spend in these down town districts—for instance, this assessment is all made by one man; he spends some days in talking with men on the east side especially, and getting such data as he can in addition to what we furnish.

Q. What data do you furnish?

A. All of the sales prices and mortgaging and so on that we have accumulated up to date.

Q. You do not furnish him with any holding values of prices, do you?

A. No sir, we do not; he is expected to get that in the talk with the real estate men.

3059 Q. Who was the man that made the valuations?

A. Mr. Higgins.

Q. That is the gardener?

A. Yes, sir.

Q. Where does he live?

A. About two miles and a half southeast.

Q. On the farm?

A. Yes, sir.

Q. That is, his principal occupation is gardening and farming

and he spends simply such time as may be required in acting as deputy?

A. Well he was placed in charge by me of that district when I first became assessor and he had been assessor I think fourteen years prior.

Q. In the country districts?

A. In that way he keeps track during the summer time of that district, knowing he is going to assess there, although he is not paid in any way.

Q. Do you know whether Mr. Higgins knew whether there has been a very marked advance in holding values or offering values?

A. Why, I know Higgins knows that property and I am quite positive that he knows almost all of the holding values. I know he knew many of them, because we had talked it over. After he has got what information he can then we assess by the front foot and before he begins with the clerical work of appraising, we talk it over ourselves so that I know what information he is acting on, and I also know the assessments before they go down as to the front foot.

Q. Of course, you don't know what information Mr. Higgins had in fact?

A. If he did not tell me all of it, of course I did not know.

3060 Q. Your experience as an assessor does not justify you in the conclusion that the owner of property puts any extravagant value on it?

A. I could not quite agree with you, because the man who holds and wants to hold has a strong incentive of giving a valuation as high as possible and is just as apt to do so as the man who wishes to sell.

Q. That is your conclusion?

A. Yes, sir.

Q. For instance, J. K. Gilchrest Company own property in the neighborhood of Vine Street?

A. Yes, sir.

Q. Have you had any experience with the Gilchrest people in regard to their estimate of the value over there?

A. No, sir; I have not over there.

Q. Do you know Gilchrest?

A. Which Gilchrest?

Q. J. K.

A. Oh yes—no I don't know J. K. I know Charles, the lumberman.

Q. Well, people are not as a rule disposed to increase the amount of taxes they pay; that is not your experience, is it?

A. No sir. I thought of that afterwards——

Q. So that if a man has property that he does not want to sell and it is not in the market and he does not expect to sell it, do you think such a man would be apt to encourage your deputy to place a large valuation upon his property?

A. No sir. I thought of that point afterwards. If you meant expressing a valuation to us of their holdings, that would not be

so, because the valuation they express to us is exactly the opposite.

3061 Q. So that if your deputy would make inquiries of the owners he would be apt to be met with a very low valuation, wouldn't he?

A. Well, I wouldn't admit to that either, because more than likely they would just simply not talk at all.

Q. Well, your conclusion is he would either remain silent or express a low valuation?

A. When he is talking to the assessor at assessing time. I find that outside of the term of assessment people talk to the assessor very freely in regard to valuations.

Q. About other people's property?

A. No, in regard to theirs too.

Q. Now, did Mr. Higgins have any special qualification to determine the value of such a property as the Gas Company, consisting as it does——

A. I valued the Gas Company myself.

Q. Have you any special qualification?

A. No sir, I wouldn't say special qualification.

Q. What qualifications have you, whether special or general?

A. Well, I have known the claims of the Gas Company for several years past as to the value of their property, and I have examined the government reports as to the valuations of that class of property, as collected and classified in their reports, and I have had the benefit of an immense amount of volunteer information.

Q. No doubt about that. That has been persuasive too, I suppose?

A. No, I can't say that it has, because it was generally high.

Q. Mr. Parker, there is some relation between what a thing will cost to reproduce and value, isn't there?

A. Oh, yes sir.

Q. Necessarily so?

3062 A. Necessarily.

Q. What do you know as to what it would cost to reproduce the distribution system of the Gas Company, its mains, services, meters etc.?

A. So far as technical knowledge is concerned, I have none at all.

Q. What knowledge or information have you or did you have with respect to what it would cost to reproduce the plant, the machinery and appliances of the Gas Company?

A. Nothing other than the information that I have had directly or indorectly from the Gas Company itself in past years.

Q. For instance, what would it cost to reproduce the large holder over there?

A. I haven't any idea. I might make a guess at it, because Bi Keffer told me what it cost; I don't recall it now.

Q. So aside from the real estate of the Gas Company of which you may be supposed to have some knowledge concerning its value, you had no knowledge of what it would cost to reproduce or replace?

A. No, sir; not from a technical standpoint; I am not an engineer in any way.

Q. How, then, did you proceed in making this valuation which you have made upon the gas property?

A. Well, it was just the outcome of my best opinion.

Q. Under what sections of the code did you make this valuation?

A. Section 1323 of course was one of them; that is the regular corporation statute, that they should make certain reports, and section 1343 would be the other one.

Q. So sections 1323 and 1343 were the ones you proceeded under?

A. Those were the ones, yes sir. Of course there is a further section relating to the real estate of the company, and there are several sections that might cross—for instance away back
3063 is the section assessing real estate, and then section 1343 requires us to add certain things to the real estate; that is one of the faults we have with the revenue law.

Q. Will you take Exhibit 29 and turn to the gas property upon which you have placed the figures indicating the assessment against the company; what are the figures?

A. $1,350,000. actual value.

Q. What does that include?

A. That includes all the real estate and personal property, machinery, fixtures, buildings, mains, and in fact all the property of the Gas Company assessable in the city.

Q. That is assessed against what?

A. Against the Gas Company and their real estate in Block C of Scott & Dean's Addition.

Q. Under what section of the code did you place that assessment against the real estate?

A. Well, 1343 would come the nearest to it, which requires a certain itemized method of assessment which it seems almost impossible to follow and for that reason, with the consent of the companies in this town we lumped the valuation.

Q. Turning to section 1343, the latter part of it, I wish you would read. You have in mind now section 1323?

A. Yes, sir.

Q. I want to inquire whether or not you are not required to make the assessment against the capital stock?

A. We are in case the capital stock has value in excess of the assessment we place on them as a real estate assessment.

Q. And that is because the real estate is to be deducted from the value of the company's property?

A. Yes, sir.

3064 Q. In this case you did not find any valuation in excess, so you did not deduct it in making the assessment?

A. Yes, sir.

Q. You had some information, as you indicated a moment ago, from the company; the company being a corporation is required to make a report each year, and the company made such report for 1909 1910 and 1911?

A. It did, yes sir.

Q. Have you those reports with you?

A. I have not, no sir. They are here somewhere as an exhibit.

Q. Are those documents present, does anyone know?

Mr. BRENNAN: Here is Defendants' Exhibit No. 1, Mr. Read.

Mr. READ: I asked for 1909, 1910 and 1911.

Q. Recurring for a moment to the assessment, you called the whole thing real estate, did you?

A. Yes, sir.

Q. The buildings, the machinery, the mains, services, meters and the stock and fixtures in the main office building?

A. Merchandise stock, yes sir.

Q. And the cash, you called it all real estate?

A. Yes, sir.

Q. Do you recall what valuation the report made by the company for 1909 placed upon its property?

A. I couldn't say as to 1909, no sir.

Q. Where are those reports, Mr. Parker?

A. They are in the auditor's office. Two of those would be in my office; the ones for 1910 and 1911 would be in my office.

The MASTER: Would there be, excepting real estate, any assessment for 1910?

A. Not in 1910.

The MASTER: The real estate is assessed in odd years?

3065 A. Yes, sir.

Q. Nevertheless, the Company makes a report?

A. They make that report under section 1323 every year. I said there was no assessment in 1908; I think there was an assessment on corporation stock in 1908.

Q. The real estate is to be taxed every two years?

A. Yes, sir.

Q. Now in the alternate years, when the levy is not made against the real estate, against what is it made?

A. The personal property, and the levy is extended against the prior assessment on real estate and the new assessment on the personal.

Q. Is that extended against the corporation stock?

A. No, sir; that is a personal assessment.

The MASTER: You have those reports in your office?

A. Yes sir, for the last two years.

The MASTER: Did the action of the state board of review affect the value of real estate in Des Moines?

A. No, sir; not town lots under which they are assessed.

Q. Do you recall approximately the return of the Company what valuation the Company return placed upon its property for the year 1909?

A. I think it is $1,250,000.

Q. Wasn't it $2,250,000?

A. I think it was somewhere in the neighborhood of $2,000,000.

Q. For the year 1909, do you recall whether the valuation placed by the Company's return upon its property was $2,400,000?

A. Well, it is purely a guess; I wouldn't say it was not.

Q. You must have some general recollection?

A. No, I have not.

Q. What was this year's valuation as shown by the Com-
3066 pany's return to the assessor?

A. In excess of $3,000,000.

Q. $3,300,000?

A. Probably; it may be $3,300,000.

Q. I wish you would send to your office and get those returns, if you can?

A. I could only go myself.

Q. I will ask you to go presently. The Company's return showed a valuation in the year 1911 upwards of $3,000,000?

A. Over $3,000,000 as I recall it.

Q. And you placed the valuation of $1,350,000?

A. Yes, sir.

Q. Why didn't you accept the Company's valuation?

A. Well, because I knew that up to this controversy the Gas Company representatives protested most strongly to the assessment of $1,000,000 and claimed their property was not worth that figure, and I felt at that time, and I had seen no evidence of any such increase in their investments, and for that reason I did not accept their figures in any sense.

Q. You made inquiries, or attempted to ascertain what additions or betterments had been placed by the Company for its property?

A. Yes, sir.

Q. You had?

A. Yes, sir.

Q. Well, now, take your statement in the year 1910, the Company's return showed a valuation of $2,400,000, and assuming that now to be accurate, to be verified later, and the previous year the return showed a valuation of $2,250,000; so that it is not exactly accurate to state that the Company had protested its valuation?

3067 A. I am talking prior to the time I took the office.

Q. But since your incumbency of the office the Company had placed three valuations by its return, for the years 1909, 1910 and 1911, and for the year- 1909 and 1910 the valuation placed by the company had been in excess of $2,000,000?

A. I think that is so, yes sir.

Q. Did you accept the Company's return for those two years and place a valuation that coincided with the Company's valuation?

A. I did not, no sir.

Q. Why did you not?

A. Because I did not consider the plant worth that figure.

Q. Did you have some other ulterior purpose in your mind?

A. No, sir, none at all.

Q. Did you with respect to the Company's return of 1911 have any conversation or conference with any person or persons?

A. No, sir; none at all, excepting representatives of the company.

Q. Did any person or persons aside from representatives of the Company make any suggestions or statements to you?

A. Why there was free volunteer information, yes sir.

Q. Who, what persons?
A. Well, I do recall Mr. Kasson and men like he.
Q. Mr. L. J. Kasson?
A. Yes, sir. There were unquestionable people talking about their own assessments, but I judge from your question you have reference to public officials; if you do, there is none ever spoke to me on the subject.
Q. You are an official of the city of Des Moines?
A. I am, yes sir.
Q. And as such you are supposed to consider it your duty to be alert in looking after the interests of the city?
A. I do, yes, sir.
3068 Q. You say that no other official of the city ever made any suggestion to you and that you never conferred with any other official of the city concerning the valuation placed by the company on its property?
A. I should say, I never talked to any one nor has any one ever talked to me. Well, now, I would correct that in this way; in the past few weeks I have had some talk with different parties.
Q. I mean prior to the placing of the valuation?
A. No, sir; I never received any communication, written or oral in any sense.
Q. You have talked though with people such as Mr. Kasson?
A. Well, the reverse; they talk with me; they come in and volunteer information.
Q. He, I dare say, urged upon you a low valuation?
A. I said Mr. Kasson; I know he has talked in regard to the Water Company; I don't know whether he talked about the Gas Company or not.
Q. You knew there was a controversy on between the city and the company?
A. Not at the time of the 1909 assessment.
Q. When did you make that?
A. Prior to March 1909.
Q. Prior to your 1911 assessment you did?
A. Oh, yes.
Q. You knew the question of the valuation placed on the Company's property was a material one?
A. By me, you mean?
Q. You knew that?
A. I knew that, yes sir.
Q. You knew that a high valuation would be detrimental to the interests of the city?
3069 A. Well, it is hard to answer that. If I may state this: it would probably better explain my position——
Q. Answer my question first.
A. I don't know what you mean by detrimental.
Q. Then answer the question in your own way.
A. In 1909 I was much concerned as to my valuation, and——
Q. Why?
A. We had had trouble continuously with all the companies and

no assessment prior to 1909 had stuck except in 1909, and that stuck simply because of the Des Moines Plan and certain things which I knew had occurred. I did not know whether the companies would any of them stand by my assessment. I had no idea what the council wanted——

Q. That could hardly be true with respect to the Gas Company because it had made a voluntary valuation in excess of $2,000,000, and the question is why didn't you accept it in 1909?

A. Because I did not think it was correct.

Q. You know, of course, that the contract made in the nineties would expire December 31st, 1910?

A. I don't know that I knew it at that time; whether I had that knowledge at that time or not. In 1910 I did have that knowledge I know.

Q. Then why didn't you accept the company's valuation in 1910?

A. Because I considered my valuation high enough.

Q. A similar controversy was pending in 1909 between the city and the Water Company?

A. That I do not recall because I was in no way connected with it.

Q. You was assessor in 1909?

A. Yes, sir; but I was in no way connected with any controversy; I may have known it.

3070 Q. The matter was very much talked of in the newspapers?

A. I say I don't recall it.

Q. You do not now recall whether you had in mind at that time the fact of the Water Company controversy.

A. Yes, sir; I don't know that I remembered it at that time; I don't say I didn't, because I have no recollection.

Q. In the year 1909 the Company in its return and report to you as assessor placed a valuation of $2,250,000 upon its property—we will assume that is correct—why didn't you accept that valuation and return as the assessed valuation of the company's property?

A. Well, I felt it my duty under the law to place my own value as I considered the property worth. I knew in 1907 Mr. Haines had protested the assessment of their company and claimed it was nowhere worth near the valuation placed on it.

Q. Of course, you were no assessor then?

A. No, sir; but I was in full consultation with the assessor or he with me. I assumed that his statement in 1907 was as nearly correct as his statement in 1909.

Q. You don't know what additions and betterments had been added to the property?

A. I thought I knew, yes, sir. I had some general knowledge, having covered the city and knowing of the mains that were put in, and I could see the tangible property on the east side; that there was no exterior display of investment; inside of the building it might have been completely changed for all I knew.

Q. Were you in conference with Mr. Kasson or such men of his ilk in 1906?

A. No, conference with anyone, excepting as I stated that it is

common for people to come in and talk over their assessments
3071 and compare it with somebody else's and unload information.

Q. I want to get at your state of mind, if I can——

A. I only mentioned him but have no recollection of anybody approaching me on the subject of this or any other Company and I have no recollection that he did.

Q. Now, for the year 1909 you were assessor?

A. Yes, sir.

Q. The law required the Gas Company as a corporation to make a valuation and return under oath to you as assessor?

A. No, sir; it did not. The law does not require the company to make any valuation of their property.

Q. The law requires a return to be made?

A. Of the items of real estate.

Q. For the year 1909 the Gas Company did as a matter of fact make a return of the items of its property and also placed a volunteered valuation upon its property?

A. They did, yes sir.

Q. You did not accept the valuation placed by the Gas Company on the property?

A. I did not, no sir.

Q. My particular inquiry to you is why you did not do so?

Objected to on part of defendants because it has been answered two or three times and it is simply taking up time to have him repeat his answer.

A. Because I did not believe it was a correct valuation.

Q. Now was there any other reason or motive or purpose on your part in not accepting the Company's valuation?

A. There was not; no sir.

Q. You suggested a moment ago as a reason that the Company and all companies had protested their assessments; of course
3072 you knew that the Company by making this voluntary valuation had placed itself in a position where it could not protest, so that was not a reason in your mind at that time?

A. No; I have no recollection of that, but I can say that the Company would not protest any valuation of less than that.

Q. So that was not a reason why you rejected the Company's voluntary valuation?

A. Oh, no, I had no fear of a protest.

Q. For the year 1910 the Company also made its return required by law and placed a voluntary valuation upon its property but you did not accept that?

A. No, sir.

Q. For the same reason?

A. Yes, sir.

Q. No other motive or purpose or thought in your mind?

A. None at all, no sir.

Q. You say you didn't know or didn't remember that the company's contract with the city would expire December 31, 1910?

A. I unquestionably knew of it in 1910, yes sir.

Q. Didn't you have in mind the fact that that contract would expire and that there would be probably some regulatory ordinance passed by the city or some rate fixed; didn't you anticipate that?

A. I certainly knew it.

Q. Didn't you anticipate that?

A. The assessment was made with no reference to that. It is immaterial to me what valuation I place upon the company provided I get what I consider the actual value. I did have this in mind; that the object of the Company in placing that value was probably two-fold; first, that they would have a higher ex-
3073 pense bill, and second, if that went through the council at their figures, regardless of my own opinion, that it would have a tendency to bind the council.

Q. So it was to counteract that result that you put that valuation on?

A. No, it was my own valuation.

Q. You say you had that in mind as a motive, or a motive on the part of the Company?

A. Yes, sir.

Q. And it was due to the Company's motive or purpose that you, among other things, scanned and scrutinized the Company's valuation and rejected it.

A. Why no. The fact that I had a suspicion as to why the Company made their report did not enter in any sense into my reason for fixing the valuation. Now I want to make myself clear. I may talk on the side a little, but permit me to illustrate it in this way: In 1909 the Electric Light Company controversy——

Q. I don't care to go to other companies. Now with respect to the return made by the Company in 1911, did not Mr. Haines on behalf of the Company state to you that the Company had had an inventory taken of its property?

A. He may have said so, yes sir.

Q. Did you examine that inventory?

A. I did not, no sir.

Q. Did you make any request to be allowed to examine it?

A. I did not.

Q. Is it not true that in 1910 in connection with the Company's return Mr. Haines made some statement concerning the question of betterments and additions or improvement of the property?

A. He may have, yes sir.

Q. Did you make any effort to ascertain what they were?
3074 A. I did not; not through their books no sir.

Q. Now suffice it to say that you, with no special qualification as to the cost or value of the Company's distribution system, of its machinery and appliances rejected the Company's valuation as voluntarily made and used your own estimate; that is true, isn't it?

Objected to on part of defendants as having been already answered.

A. Not exactly, no sir. I stated I had a knowledge of the claims of the Company prior to 1909. I had no technical knowledge with

reference to that matter. I knew of the claims of their property at that time.

Q. For instance, Mr. Parker, how many miles of mains did the Company have prior to 1909?

A. I don't now know. But in 1909 I asked Mr. Haines the number of miles that he did have. How many it was I don't recollect now, because I kept no track of it.

Q. Do you know what additions to its plant had been made in the intervening years?

A. Not so far as only I could see from the outside.

Q. What changes had been made according to your knowledge?

A. Very little, excepting keeping up around the place and erecting a tank on the further side of Fifth Street.

Q. These claims on the part of the Company that you say you had knowledge of were claims made in 1907?

A. And 1908.

Q. Your assumption is there had been no improvement or betterments to any extent made in the intervening years?

A. Well, of course there was $350,000 or $360,000 worth. These figures with a Gas Company are small, while with the indi-
3075 vidual they are large. I raised their assessment $360,000 over 1907 to 1911.

Q. You made no raise in the meanwhile?

A. I made a raise in 1909 and 1911.

Q. How much?

A. $360,000 in two assessments; just how it is divided I don't recall.

The MASTER: Did you take into consideration the income of the property?

A. Not an excessive income; we do if it is a small income. If a man works his plant at full capacity and makes a small income, it necessarily reduces the value of the property.

The MASTER: I mean the income of the property.

A. For instance, if this Company were making 20 per cent, I would not take it into consideration; but if they were making two or three per cent upon their investment, we would consider it.

The MASTER: You would not consider a high per cent, but you would a low?

A. Yes, sir; I mean to the same extent.

Q. I want you to bring in the report for 1909 and 1910 and 1911?

A. I thought they were here. I have copies of them anyhow.

Q. I want you to satisfy your own mind as to those figures?

A. I am satisfied they are about the figures as I remember them—$2,000,000 and $3,000,000 but I am willing to look it up. I have not seen those figures for years.

Redirect examination by Mr. BRENNAN:

Q. Now, Mr. Parker, you spoke something of some discrepancy made by you in your assessments between the Fleming Build-
3076 ing and the Citizens Bank Building; I want you to clear that up on the record, if there were any reasons why you made any distinction or difference?

A. We always consider an improvement and the ability to utilize that improvement to its full extent. The Fleming Building we never have assessed at anywhere near the cost, because at no time has the Fleming Building been more than two-thirds occupied and if they cannot fill that building it is not worth what it cost, and we take those things into consideration. We make a canvass of the office blocks and ascertain the percentage of empties.

Q. You say at the time that assessment was made the Fleming Block was not fully occupied?

A. No, sir.

Q. What was the fact as to the Citizens National Bank Building?

A. It was practically full.

Q. So that explains any difference in the assessment?

A. That is the principle we pursue.

Q. As I understand you, in making this assessment against the Des Moines Gas Company, as shown upon Exhibit 29, you did not undertake to assess the Capital Stock of the Company?

A. Well, did undertake—that is, I had that in view, but there being in my opinion no valuation of the capital stock in excess of the assessment, I could make none.

Q. You did not proceed under section 1323 to arrive at the value of the capital stock without regard to the property which was back of that stock, as you do ordinarily under section 1323?

A. I did not attempt to value the stock technically, if I understand your question.

Q. There is a section, 1319, which applies to manufacturing corporations?

3077 A. Yes, sir.

Q. And the method pointed out in that section is practically what you followed in this, namely, to get at the value of the tangible property of the concern about to be assessed?

A. Yes, sir; that would be the plan.

Q. Now you have been asked why you rejected the statement made by the Gas Company in the years 1909 and o911. I will ask you if you had the information with respect to the sworn statement by Mr. Haines as manager of the Des Moines Gas Company in the year 1908?

A. I knew of it, yes sir.

Q. And for the purpose of refreshing your recollection on that subject I call your attention to defendant's Exhibit No. 1 and ask you if when you came to make that assessment in the year 1909, you had in mind the information which that statement purports to give?

A. I did. I could say this in regard to these statements; these statements put down here were compulsory; it was not conceded by Mr. Haines that that figure was the valuation. They were placed there at the requirements of Mr. Schramm, known to myself, because of the difficulty Mr. Schramm had had in settling with the companies in prior years. He said that he will make a certain assessment or will agree on an assessment, and if they agreed on the assessment he took that assessment and laid it before the board and it was

always cut down at the request of the company. We looked around for some way to head that off, and the two of us devised a scheme of either making an absolutely arbitrary assessment on the company, or compel them to enter that valuation in this report and sign it up, the idea being if they put it in that report they would not be in a position to appeal from it. I know that it was placed there
3078 and Mr. Haines refused himself to sign it.

Q. Let me ask you if at any time prior to the year 1909 any controversy arose between the assessor and the Gas Company on account of the fact that the assessor was not placing a valuation high enough to suit the Gas Company, or did the controversy grow out of the fact of the assessor placing too high a valuation?

A. It always came out of that controversy and this was done to head that off.

Q. Was the company complaining that the assessment as it was about to be returned was too high?

A. Yes, sir; the company complained so.

Q. Then it was in 1908 that you had Mr. Haines make a sworn statement appearing in Defendants' Exhibit No. 1, so as to have them go upon record under oath as to the value of their property?

A. In 1907 is the one I have reference to: what occurred in 1908 I do not recall. The one that stuck was 1907, the one that passed by the board of review without question.

Q. Had the company in the past made it a practice to appear before the board of review?

A. Yes, sir: in spite of the fact that they had agreed with the assessor on his assessment.

Q. So that in 1909 and in 1911, if I understand you rightly, you undertook to assess the property of the Des Moines Gas Company on a basis which appealed to you as being fair and equitable?

A. Yes, sir.

Q. Taking into account the valuations placed upon other public utilities in this community?

A. Yes, sir. I would like to state this, that the assessor is
3079 continuously importuned to both raise and lower valuations and that the Company property would not be the only property that the people claimed was too low; so that the claim of the Company that their property was too low was not uncommon, excepting as to ownership.

Q. You were asked if you had assumed that the city council would pass a regulatory ordinance after the expiration of the contract. I presume it was fair to assume in view of their past conduct that some change would take place in view of this report which they made to you in 1909 and 1911?

A. That I stated was my opinion of their high valuation in 1910 and 1911. I do not have any recollection what I had in mind in 1909, other than the controversy I had been mixed up with in 1907.

Q. For how many years prior to the year 1909 had you been connected directly or indirectly with the revenue department of the county?

A. Sixteen or seventeen years.

Q. During these sixteen or seventeen years, had you been more or less familiar with the valuations returned by the assessor?

A. Yes, sir.

Q. Did ou confer with him in regard to these assessments?

A. I did in the later years; they conferred with me, especially the larger companies.

Q. Have you in mind any year prior to 1909 that the Des Moines Gas Company or the Capital City Gas Light Company ever appeared or made a statement to the assessor protesting that the assessment was too low?

A. In 1907, 1905 and 1903?

Question repeated.

A. No, sir; I never knew them to. I beg your pardon, I didn't notice the words too low.

3080 Q. Now, Mr. Read asked you something about Mr. Higgins, trying to give out the inference that instead of being an assessor he was engaged almost exclusively in farming. I will ask you if this is Mr. Elsie Higgins to whom you refer?

A. Yes, sir.

Q. For what length of time has he been employed by the county in making assessments of property in the city of Des Moines and elsewhere?

A. I think it will run from 13 to 15 years. He came in under French and served through Mr. Schramm and myself.

Q. And has his district been confined to the remote parts of the city or what we call the farming districts in the county?

A. No, sir; he has been considered one of the best men and has for many years been retained on down town assessments.

Q. Now you were asked concerning the property in the northeast corner of First and Walnut Streets, purchased by the Lawyrence Ill Estate. Do you know at what price that property was purchased?

A. That is First and Court Avenue. Yes sir, about $25,000.

Q. Do you know how much frontage there is on Court Avenue?

A. 132 feet.

Q. How much upon First Street?

A. 132 feet.

Q. Is there an alley in the rear?

A. There is an alley both north and east.

Q. It covers a quarter block?

A. Yes, sir.

Q. And was purchased for $25,000?

A. Yes, sir, $25,000 or $28,000.

Q. Do you know what improvements, if any, were upon this quarter block at the time of the purchase?

3081 A. I don't recall particularly no sir.

Q. Do you recall that there was a brick building about two stories in height running back to the alley?

A. The corner I know was brick two stories high; I think they were all frames east of that.

Q. But there was a substantial bric*j* building upon the premises at the time of the purchase?

A. Substantially in its size, yes.

Recross-examination by Mr. READ:

Q. Deputy assessors are paid two dollars a day?

A. Two fifty.

Q. As a matter of fact, there has been a constant claim for a good many years by some members of the public that the corporations were not assessed enough?

Objected to on part of defendants as irrelevant, immaterial and hearsay.

A. There has been up to recent years at least.

Q. Has that complaint abated any in recent years?

A. I think it has.

Q. Disappeared entirely?

A. No, sir.

Q. It is still claimed?

A. Yes, when you are talking about public remarks.

Q. You said that the Fleming Building was about only two thirds occupied?

A. That was last fall when we took our information on the subject.

Q. This assessment was made in the year 1911?

A. Yes, sir.

3082 Q. Of course somebody told you it was only two-thirds occupied?

A. The Fleming Brothers, together with the fact that we looked around. I sent a man out with the proprietor to try the doors.

Q. This was last fall?

A. Yes, along in November or December.

Q. This assessment for the year 1908 that you agreed to was practically an agreed valuation?

A. I did not make the 1908 assessment.

Q. You were talking about the one Mr. Brennan showed you the return of made by the Company?

A. I had reference especially to 1907.

Q. You don't know anything about the 1908 assessment?

A. I was under the impression there was a little corporation stock in that year.

Q. Your attention was called to Exhibit No. 1, which is the return of the Gas Company made in 1908. Now in answering Mr. Brennan's question, did you speak with reference to that assessment or some other year?

A. I am at a loss to know just what question he asked me.

Q. Did you speak in answering Mr. Brennan with reference to the assessment of the year 1908?

A. The 1907 assessment is clearly in my mind. The 1908, there was little or no controversy and therefore I haven't that so much in mind.

Q. You called attention to the fact that the return for that year was sworn to by Mr. Haines?

A. 1907 is the one I had reference to. There was no valuation in 1908; you were asking about a valuation made.

Q. I am asking about a return.

A. The one I had reference to not being signed by Mr.
3083 Haines was in 1907.

Q. That was signed by Mr. Keffer?

A. Yes, sir.

Q. That was practically an agreed valuation?

A. Yes, sir; it was agreed under protest.

Q. The Company still protesting it was assessed too high, but assenting to it?

A. Yes, sir.

Q. You said that one of the objects was to cut off the protesting of the company against the valuation, that was one thing to be accomplished by having it signed?

A. By having them sign an agreed statement.

Q. If you had been anxious about that, I inquire again why you did not accept the company's valuations for the years 1909, 1910 and 1911?

Objected to on part of defendants as having already been fully answered.

Q. That would cut off any protest?

A. I do not want to assess any man any more than I think he is worth; I can not do it under my oath.

The MASTER: You said these manufacturers were assessed from 60 to 70 per cent of the selling value?

A. From 60 to 70 and 85 to 90—not necessarily manufacturing, more the commercial center.

The MASTER: That would make the selling price of this property 60 per cent of $2,000,000?

A. We are speaking of bare real estate, not commercial enterprises at all.

Redirect examination by Mr. BRENNAN:

3084 Q. In other words, you tried to eliminate the factor of speculation with respect to real estate being bought and sold?

A. Yes, sir.

Q. I call your attention to Defendants' Exhibit No. 1, which purports to be a statement of the Des Moines Gas Company signed by W. B. Keffer, secretary, on the 15th day of February, 1908, and call your attention to the affidavit of Jansen Haines, Manager, executed on the 14th day of March, 1908, and I will ask you if that is the controversy to which you refer?

A. No, sir; it is the report prior to this, 1907. There is no assessment made in 1908 on their property unless they had a new building or new construction. But there was one year in which the assessor to make a raise assessed them on the corporation stock and I was

thinking that was 1908; but I may be mistaken. The one that I said was not signed, as I recall it by Mr. Haines, was the 1907 report, the one in which the controversy of the valuation took place.

Q. In 1907 you requested, or the assessor requested of Mr. Haines that he make a statement similar to that shown in Exhibit 1 which he refused to make?

A. He did not refuse to make it; he did and he did not. He did not want to make it but his assistant was permitted to make it, and we had the verbal statement of Mr. Haines it would go.

Q. That was in 1907?

A. Yes, sir.

Recross-examination by Mr. READ:

Q. Referring to your statement that the valuation of 60
3085 per cent applied to the ground only—you made that statement, didn't you?

A. Yes, sir.

Q. What is the practice as to the valuation of manufacturing appliances and machinery, etc. Is there any different rule in regard to that?

A. Well, take for instance real estate, if it is in a district in which there is in our opinion an element of speculation, we take that into consideration. It may vary from 35 or 40 per cent down to five. Now the buildings are taken for what we consider the cost price and deduct——

Q. My inquiry is as to manufacturing appliances or machinery?

A. Well, we make a discount on machinery.

Q. How much?

A. It varies on machinery as high as 50 per cent.

Q. How much did you discount the machinery of the Gas Company?

A. I made no particular itemization of the discount in theirs.

Q. What does the valuation placed by you contemplate as a discount?

A. I couldn't state any at all, that is, any particular discount in any line.

Q. Probably as much as fifty per cent?

A. Oh no, because what knowledge I would have I would not consider that they had very much investment in manufacturing.

Q. You didn't know enough about it to know what the real value was?

A. I wouldn't want to answer that way. My idea of the value of their plant lay in their distribution system rather than in the manufacturing.

Q. But as to the machinery appliances used in manufacturing it is generally put at 50 per cent?

A. 50 per cent would be the maximum. It would depend
3086 so much upon the nature of the machinery. When I talk about 50 per cent I mean the machinery which will wear rapidly.

Redirect examination by Mr. BRENNAN:

Q. You don't mean to be understood as saying that you have valued this property for the purpose of taxation at 60 per cent of its true value?

A. No, sir.

Q. Or 50 per cent?

A. No, sir.

Q. The $1,350,000 which you returned, what does that purport to represent?

A. The actual value of the property as I considered it.

Recross-examination by Mr. READ:

Q. That answer is made in view of your previous answer that there is a practice to allow a varying per cent on machinery?

A. Yes, sir.

Excused.

JAMES HALL, being first duly sworn, examined in chief by H. W. BYERS, Esq., testified:

Q. Give your name and place of residence to the reporter?

3086½ A. James Hall; residence, Chicago, Illinois.

Q. What is your business?

A. Public accountant.

Q. How long have you been such?

A. I have been at the business 18 years.

Q. And with whom are you associated at this time?

A. A member of the firm of Marwick, Mitchell & Company.

Q. What is the business of Marwick, Mitchell & Company?

A. Public accountants.

Q. Where are their headquarters?

A. In New York.

Q. I wish you would state in a general way the field they cover in their operations as public accountants?

A. They are located in 18 towns in this country, in Paris, France, London, England, and Glasgow, Scotland.

Q. Will you give the names of the cities in this country where they have offices?

A. New York, Washington, D. C., New Orleans, Philadelphia, Boston, Pittsburg, Chicago, St. Louis, Milwaukee, Kansas City, St. Joseph, Mo., Minneapolis and St. Paul, Salt Lake City, Spokane, Montreal and Winnipeg, Canada. The business covers all matters with the accounting and auditing investigations on behalf of bankers, stockholders and directors, and acting as secretary and controllers of companies; generally anything connected in that line.

Q. Does the firm do any work for the Government?

A. Yes, sir; we act on behalf of the Comptroller of the Currency, investigating banks; we have acted for the Secretary of the Navy, installed a system of accounting in all the navy yards in this country.

Q. Now as to your own relation to the company, Mr. Hall,
3087 in what way are you connected with the firm?

A. Partner.

Q. How long have you been such?

A. Five years.

Q. Now, I wish you would state Mr. Hall in your own way as fully as you care to the experience and training you have had to fit you to perform the business or carry on the business of an accountant?

A. I served my articles of apprentice with a firm of accountants in Scotland. After completing it I qualified as a member of the Accountants' Institute; that entitled me to use the designation Chartered Accountant. I had twelve years' experience in various offices in the old country before coming to America; I have been six years here.

Q. Now in Scotland, will you give to the Master in a brief way just the period that is necessary to be occupied over there in fitting yourself to be a chartered accountant?

A. The present period is five years' articles.

Q. What was it when you were there?

A. Four years. Before qualifying attendance must be made at prescribed classes in the University, taking law and political economy, etc.

Q. Are you a certified accountant in any of the states of America?

A. Yes, sir.

Q. What one?

A. Ohio, Minnesota and Missouri.

Q. Is there any examination required?

A. Either an examination or acceptance of previous qualification.

Q. How was it in your case?

A. An acceptance of my qualifications as chartered accountant.

3088 Q. Are you a member of any association or organization?

A. I am a Fellow of the American Association of Public Accountants.

Q. Is that an American association?

A. Yes.

Q. Now I wish you would state the date from which your experience as a public accountant, chartered accountant begins?

A. I commenced my articles in August 1893; qualified as a chartered accountant in December 1900.

Q. Have you been continuously engaged in that profession and business?

A. Ever since, all the time.

Q. Now since 1893, I wish you would take plenty of time now, and state to the Master just what companies you have examined or just what you have done in the way of investigating the books and accounts of operating companies or companies of any kind since 1893. Do it in your own way and take plenty of time.

A. I am afraid that is almost impossible.

Q. As much as you can?

A. Commencing with my period in this country?

Q. Yes, sir.

A. I have examined all the companies connected with the General Motors Company, and acted as comptroller during the period of refinancing. Have examined the accounts of the Studebaker corporation, the Chicago City Railway Company, the Chicago Junction Railway Union Stockyards Company, People's Gas Light & Coke Company of Chicago, Consolidated Gas Company of New York, Cedar Rapids Gas Light Company, Cedar Rapids, Saginaw Gas Light Company, Saginaw. These are the principal ones I can now recall.

Q. When were you occupied in the examination of the People's Gas Light & Coke Company of Chicago?

A. At the close of the year 1905.

3089 Q. How extensive was that investigation?

A. That was an examination of the operating accounts for the year 1905.

Q. And the Consolidated Gas Company of New York, when was that examination made?

A. That was in December 1906.

Q. What was the scope of that examination?

A. It was an examination of the operating accounts for the year 1905, I think, and the construction accounts for a period of about 20 years.

Q. What was the purpose of the examination?

A. An adjustment of rates charged the consumers of New York City.

Q. What if anything did the examination have to do with ascertaining the cost and expenses of manufacturing gas?

A. It had almost all to do with it.

Q. Covered that entire field?

A. The entire field.

Q. When were you engaged in the examination of the Cedar Rapids Gas Light Company?

A. In the fall of 1907.

Q. What was the scope of that examination?

A. So far as I recall, all the accounts for a period of five years, both construction and operating.

Q. What was the purpose of the examination?

A. An adjustment of rates charged the consumers.

Q. Covering the entire field of the cost of manufacture and expense of distributing gas?

A. Yes, sir.

Q. And the Saginaw Gas Light Company, when was that investigation and examination made?

3090 A. In the spring of 1908.

Q. And was the scope of that examination similar to the others?

A. Similar to Cedar Rapids, I think, five years.

Q. Was it also for the purpose of ascertaining the cost and expense of the manufacture of gas?

A. Yes, sir.

Q. In a rate case?

A. Yes, sir.

Q. And in how many of those cases did you make up a complete report?

A. In the New York case, the Cedar Rapids case and the Saginaw case.

Q. In the People's Gas Light & Coke Company, for whom were you employed in that investigation?

A. The city council.

Q. And the Consolidated Gas Company of New York?

A. By the corporation counsel.

Q. And the Cedar Rapids Gas Light Company?

A. The City Attorney.

Q. Now in addition to the examination of the books of accounts of those concerns that we have just mentioned, have you had any other or further experience in the examination of the accounts of gas companies and public utilities?

A. Yes, sir.

Q. In a general way, will you state?

A. Have examined the accounts of public utilities of all kinds, acting on behalf of bankers, stockholders or directors.

Q. I wish you would give us some idea of the business of that firm, Marwick & Mitchell, the number of men employed and what they are *are* doing and whom they serve?

A. At present we have approximately 275 upon the pay roll. They are located in the cities I have mentioned, engaged
3091 almost entirely in making investigations for various purposes and making audits.

Q. Do they have any other business except that of accountant?

A. No other business.

Q. They confine their operations to that class of work?

A. Entirely.

Q. Now, Mr. Hall, have you had anything to do with the examination of the books of accounts of the Des Moines Gas Company?

A. Yes.

Q. Since when?

A. Since July 10th or 12th?

Q. How did you come to be concerned with the examination of the Des Moines Gas Company books?

A. I was retained by the city council or mayor.

Q. About when was the date of your employment?

A. About July 10th of this year.

Q. Have you since that time made an examination and investigation of the books and accounts of the Des Moines Gas Company?

A. Yes.

Q. Over what period did the examination extend?

A. Up to within about two weeks ago, about the end of August.

Q. During that time have you had some assistance?

A. There have been four men on the work.

Q. I wish you would state just how long the four men were engaged in the work?

A. The total time to August 31 was approximately 1040 hours; 940 hours for the four men and about 100 hours for myself.

Q. Now, Mr. Hall, have you made up a report of the investigation and examination?

A. Yes, sir.

3092 Q. And do you have it with you?

A. Yes, sir.

Q. I wish you would hand it to the Master?

(The report handed to the Master is marked Defendant's Exhibit (30).)

Q. I wish now, Mr. Hall, using such memorandum as you care to for the purpose of refreshing your recollectio-, you would first state the scope of the investigation covering the Des Moines Gas Company property?

A. In regard to the operating accounts the examination covered a period of five years to December 31, 1910; it also included a general review of the construction accounts from 1886 to 1910.

Q. Anything further under that head; what if anything was done in the way of ascertaining the actual amount expended?

A. We ascertained the actual amount expended in the plant and property, commencing with the appraisal in 1895 down to date.

Q. Where did you get the appraisal?

A. The app-aisal I think was by Col. Pratt in 1894, at the time of the last suit in this connection.

Q. That was made by Col. Pratt, who was then the manager of the Des Moines Gas Company?

A. As I understand it, yes sir.

Q. Will you state into the record what you ascertained with respect to the history of the company?

A. I ascertained the Des Moines Gas Company was incorporated March 1, 1906, to acquire the properties of the Capital City Gas Light Company, both concerns being owned and operated by the United Gas Improvement Company, the consideration granted by the Des Moines Gas Company for this property, including certain properties at Valley Junction amounted to $3,334,000.

3093 Q. Made up in what way?

A. First mortgage 5% bonds $285,000; 6% preferred stock contracts $800,000; capital stock $2,249,000. In addition the Des Moines Company assumed certain bond obligations of the Capital City Company of $400,000. Of the $285,000 Des Moines Company bonds $45,000 was stated to be issued to Mr. Haines and Mr. Keffer in payment of the Valley Junction properties; and $120,000 was paid over to the United Gas Improvement Company in liquidation of the debt of $105,526.49. The remainder having a face value of $3,169,000. was distributed to the stockholders of the Capital City Company by way of a dividend. Subsequent to March 1, 1906, additional bonds were issued, $400,000. being to redeem the Capital City bonds and the remainder being issued against extensions. The total issue December 31, 1910, was $1,097,000. 5% first mortgage bonds. Of the preferred stock contracts amounting to $800,000 March 1, 1906, $389,000 had been repaid, leaving outstanding December 31, 1910, $411,000. The present capital stock outstanding is $2,250,000.

The MASTER: You call stock indebtedness?

A. It is to the stockholders.

Q. Now that total is how much?

A. $3,758,000, December 31, 1910.

Q. That includes two million and a quarter stock?

A. Yes, sir.

Q. Now on page 4 of your report, Mr. Hall, I wish you would explain for the Master the matter that appears there, just what you claim for it?

A. On page 4 we state the various expenses to be considered in determining whether or not 90 cents per thousand is a rea-
3094 sonable rate of selling gas to the consumer. The first matter to be considered is the cost of manufacturing and distributing gas, before making any payment in respect to interest on bonds or floating indebtedness. The second question to be considered will be one of depreciation, how much should be charged in that regard. We also have got to consider the investment in the business of the company upon which the stockholders are entitled to a return. Then we next consider what capital is invested in the business.

Q. You have set out here a table at the top of page 4, you may state what that represents?

A. The table represents the charge for gas during the period of the ordinance expiring December 31, 1910.

At this time an adjournment was taken until 1:30 P. M.

3095 1:30 P. M., TUESDAY, *September* 12, 1911.

JAMES PARKER recalled for further cross examination by W. L. Read, Esq., testified as follows:

Q. You have obtained and produced copies of the returns made by the Des Moines Gas Co. for the years 1909, 1910 and 1911 have you not?

A. Yes, sir.

Q. These returns are entitled "Statement of the Des Moines Gas Company Des Moines, Iowa, made under section 1323 of the code of Iowa for the purpose of assessment" are they not?

A. Yes, sir.

Q. For the year 1909 the copy is marked complainant's exhibit 45 is it not?

A. Yes, sir.

Q. For the year 1910 it is marked complainant's exhibit 46?

A. Yes, sir.

Q. And for the year 1911 complainant's Exhibit 47?

A. Yes, sir.

Q. These returns are upon blanks prepared by the assessor?

A. Yes, sir.

Q. And furnished to the gas company?

A. Yes, sir.

Mr. READ: Complainant o-fers in evidence Exhibits 45, 46 and 47 as part of the cross examination.

Mr. BRENNAN: To which offers and to each thereof the defendants object for the reason the same are incompetent, irrelevant and immaterial and for the further reason that they are mere self serving declarations of the complainant.

3096 Mr. READ: You do not make any objection that these are copies of the original?

Mr. BRENNAN: I want to find out first. I will if Mr. Parker has the original.

Redirect examination by R. O. BRENNAN, Esq.:

Q. Are these exhibits, Mr. Parker, made from the originals filed in your office?

A. Yes, sir.

Q. And have been compared by you?

A. They have, yes, sir.

Mr. BRENNAN: Then the objection that the offers are not competent does not go to the form in which the offer is made, that is to say the defendants do not object to the fact that the copies are offered instead of originals.

Q. Do you recall whether you requested any statement of the company during these years or did they volunteer these statements?

A. I requested the statements. Not as to that statement of valuation I requested the information required by — 1323 of the code.

Witness excused.

3097 JAMES HALL being continued on direct examination by Hon. H. W. Byers, testified as follows:

Q. Referring again Mr. Hall to some of your answers before dinner, if I understood you correctly the consideration as shown by the books of the Des Moines Gas Company for the property of the Capital City Gas Light Company as set out in the books, actual book entries of the Des Moines Gas Company showed a total of $3,335,000 made up of the following items: $285,000 of first mortgage five per cent 20 year gold bonds, dated March 1, 1906, being a part of a total authorized issue of $1,500,000, $800,000 of six per cent preferred stock contracts and 22,490 shares of $100 of the capital stock of the company out of a total authorized issue of 22,500 shares making $2,249,000 in stock, is that correct?

A. Yes, subject to the correction that the total was $3,334,000.

Q. And these figures appear upon the books of the company do they?

A. Yes, sir.

Q. In that entry was the Valley Junction plant included?

A. Yes, sir; $45,000.

Q. Now later on you stated that the bonded indebtedness as shown by the books of the Des Moines Gas Company, the five per cent bonded indebtedness had increased to $1,097,000 up to the 31st day of December, 1910. That of the six per cent preferred stock

contracts there remained unpaid at that date $411,000 and at that date there was outstanding 22,500 shares of stock making a total of $3,758,000. Is that shown by the books of the Des Moines Gas Company.

A. Yes, sir.

Q. What do you have to say as to whether or not this
3098 $3,758,000 represented the total indebtedness of the company on December 31st, 1910?

A. It is the total indebtedness to the bond holders and the stock holders.

Q. Counting the stock?

A. Yes, sir.

Q. Then if I understand you up to this point without reference to any memorandum, if I understand your testimony up to this point, the Des Moines Gas Company at the beginning of its existence after its organization and the issuance of its stock, the Des Moines Gas Company started out with an indeb-edness of $3,334,000.

A. Plus an indebtedness of $400,000 first mortgage bonds of the Capital City Company.

Q. Which it had assumed, but the securities that it actually issued at the beginning of its existence as shown by the books of the company if I understand your testimony is $3,334,000.

A. Yes, sir.

Q. And at that date the beginning of its existence it owned or had whatever assets the Capital City Gas Light Company had transferred?

A. Yes, sir.

Q. And no more?

A. No more.

Q. You stated before dinner that there was several things involved in the question of the reasonableness of a given rate per thousand feet of gas. I wish you would state now, taking all the time you need, your conclusions upon these several questions that you stated before dinner and how you arrive at it?

A. The first consideration is the cost of manufacturing and distributing gas in the city of Des Moines. I made up the state-
3099 ment on page 5, showing the cost of manufacturing and distributing gas leaving out of consideration all interest and bonded and floating indebtedness, depreciation of the plant, also several items of an extraordinary nature not chargeable to the operations of the gas plant and to *ge* considered separately and the results are that for the two months to February 28, 1906, the cost of manufacturing and distributing in Des Moines excluding depreciation and all interest was 67.13 cents per thousand cubic feet. For the year to February 28, 1907, the cost was 64.86 cents. For the next year to February 29, 1908, 63.49 cents. For the year to February 28, 1909, 59.73. For the ten months December 31, 1909, 52.92 cents, giving an average for the four year period of 62.79. For the year to December 31, 1910, the cost was 65.19 cents with an average for the five years of 63.34 cents.

Q. Now you may state what the fact is as to whether these figures

which are the basis of your final averages are shown and were taken from the books of the company, actual operatio*j*s of the company?

A. In all cases subject to one or two minor adjustments.

Q. What were those minor adjustments?

A. The elimination of a charge made by the company for the expense of regulating rates in the city. The company charged that expense as an operating charge and I exclude it on the ground that it has nothing to do with the consumer.

COURT: The expense of what?

A. Making the appraisal and rate regulation cost.

Q. It is that item of $5,000 and some dollars?

A. $5,935 I think is the exact figure.

Q. Is your other answer answer exactly correct Mr. Hall, is it not fair or truthful for me to say that all of these figures as they
3100 appear here were taken from the books?

A. In all cases, yes.

Q. I mean in these tables from which you arrive at these averages of cost of manufacturing and distributing gas on page five?

A. In all cases, they were taken from the books.

Q. What you mean is that the books show in addition to what you have set out here and figures that you use a claimed expense of operation of something like $5,000 which was paid for work in this law suit?

A. Yes, sir.

Q. Getting ready for this lawsuit?

A. Yes, sir.

Q. That you have not included in these figures for the purpose of arriving at these averages?

A. I have not. I have excluded this figure and included another figure which they do not have in the books.

Q. What item is that?

A. The item of federal tax applicable to the year 1910 and not paid until 1911. It is a proper charge against 1910 and I so entered it.

Q. Now was there any other elimination?

A. Yes, in the two months' period to February 28, 1906, I eliminated all accident claims applicable to the prior period.

Q. Then what do you have to say as to whether the figures that you used as the basis for these tables and averages being figures that actually appear upon the books of the company and cover the operations of the company for the years stated with the one exception of what you may term expense of this litigation?

A. They do.

Q. Now will you give your conclusion on the next proposition if you were through with this one?
3101

A. Not quite. The figures given on page 5 as representing the actual expense of manufacturing and distributing have been adjusted to give effect to the tax *pable* to the city in the event of this ordinance passing, that is 2/10 of a cent. That is found on page 6. The tax payable to the city I believe is two per cent of the gross earnings of the company.

Q. Then I wish you would proceed and give the Master the adjusted cost with that change?

A. For the two months to February 28, 1906, 66.93 cents per thousand cubic feet. For the year to February 28, 1907, 64.66 cents. For the next year to February 28, 1908, 63.29 cents. For the year to February 28, 1909, 59.53 cents. For the ten months to December 31, 1909, 62.72. Average for four years to December 31, 1909, 62.59. For the year to December 31, 1910, 64.99 cents. Average for the five years to December 31, 1910, 63.14 cents.

Q. Now if you will, just proceed with the working out of your conclusions just as you have stated them.

A. I adjusted this report to give effect to the allowance in respect to depreciation covering the wear and tear and probable inadequacy and obsele-cence. In that connection I may say no regular depreciation charge is put through the books of the company but they are undoubtedly entitled to one, consequently I added six cents per thousand cubic feet of sales.

Q. Right at that point, you say if I understood you a moment ago that the books do not contain any regular continuous charge for depreciation.

A. They do not.

Q. Go on in your own way with your explanation?

A. I enter an allowance of six cents per thousand cubic
3102 feet for each period after I have the adjusted allowances making for the two months ending February 28, 1906, 72.93 cents.

Q. Including the six cents, allowance for depreciation?

A. Yes, sir. For the year ending February 28, 1907, 70.66 cents. For the year to February 29, 1908, 69.29 cents. For the year to February 28, 1909, 65.53 cents. For the ten months to December 31, 1909, 68.72. Average for four years to December 31, 1909, 68.59 cents. For the year to December 31, 1910, 70.99 cents. Average for five years to December 31, 1910, 69.14 cents.

Q. Now if you will proceed with your adjustment and give the effect as you say to the ninety cent gas rate?

A. The next question to be determined was what profit would accrue to the company applying these adjusted costs assuming a ninety cents rate for gas in Des Moines. The sales were not known for 1911 consequently I placed the 1910 sales on a basis of ninety cents and applied the adjusted costs including six cents for depreciation.

Q. How did you arrive at that definite figure of six cents for depreciation?

A. Being in my judgment a reasonable sum to cover the wear and tear and probable inadequacy and obsolescence of the plant.

Q. On what does your judgment rest, experience?

A. Experience of having examined accounts of similar companies and consultations with various engineers.

Q. Have you tested out that rate well enough so you are willing to state it here as a fair allowance?

A. In my opinion it is a fair allowance.

Q. All right go on.

A. The adjustment statement is given on page 7. In the
3103 first column I entered the sales in Des Moines, Valley Junction and the used at works. In the second column the results stated in dollars and cents accepting the company's operating expenses as shown on the previous page. The net revenue on this basis available for interest and other charges would be $192,107.65. That is on the basis of dollar gas.

Q. The basis on which they are operating now?

A. Yes, sir. Apply the same figures for Des Moines on the basis of ninety cents.

Q. Without any increased sales?

A. Without any increased sales or increased expense, giving effect to the allowance for depreciation, have a net revenue available for interest and other charges of $104,884.98 made up of the sales in Des Moines 521,486,354 feet at 90 cents or $469,337.72. The Valley Junction sales on the basis of the actual receipts during 1910 $10,579.02. The used at works I enter at a dollar and treated the figure at the same rate in the expenses, makes no difference in the rate, $3,615.60. The total sales of $483,532.34. I deduct for discount applicable to the Valley Junction sales, $1,000.

Q. Why did you do that?

A. Well they have to give a discount for prompt payment there. I understand the new ordinance here does not provide for discount.

Q. You deduct that amount because of that fact?

A. Yes, sir; and I might say that a thousand dollars is good and high.

Q. It is plenty anyway?

A. It is plenty anyway. Gives $482,532.34. The operating expenses are $377,647.36, leaving a net revenue of $104,884.98. That return is equivalent to 19.71 cents per thousand cubic feet
3104 sold.

Q. That is this $104,884.98 is equivalent to the net return?

A. Net return available for interest and other charges of 19.71 cents.

Q. I wish you would explain to the Master the method adopted by you and the basis upon which you adjust operating expenses.

A. I accepted the operating expenses as actually recorded in the books subject to the deduction for the rate expenses and the addition of taxes and enter them at $346,785.35. Added depreciation six cents per thousand on sales of 531,991,234, that is equivalent to $31,919.46. From that I deduct the 2/10 of one cent adjustment in respect of the city taxes.

Q. What city tax do you refer to?

A. Payable to the corporation two per cent on gross sales in Des Moines, $1,057.45 giving the adjusted operating expenses of $377,-647.38.

COURT: How do you come to deduct that tax?

A. At the present rate on dollar gas the company pays the city two cents. On ninety cent gas two per cent of ninety cents would

be 1.8 cents, would be a corresponding deduction, the amount payable the city is two per cent of the gross receipts.

Q. As I understand that proposition up to that point, the books of the company show and these figures are taken from the books by you and your men, that the net revenue at the present rate of gas for interest and other charges for 1910 was $192,107.65.

A. Yes, sir.

Q. And then you take as a basis the same sales knowing the sales and figure out the net revenue available for the same purposes at the ninety cent rate and increase the expenditures the difference between $346,785.35 as shown by the books of the company
3105 and your adjusted amount of $377,647.36.

A. Yes, sir.

Q. Which represents what you have added to the operating expenses under the ninety cent rate?

A. Yes, sir.

Q. And it works out a net revenue available for interest and other charges of $104,884.98 or the equivalent to a return of 19.71 cents per thousand cubic feet of gas sold.

A. Yes, sir.

Q. Did you find the operating expenses of this company for the year 1910 to be usual and o-dinary or were they abnormal?

A. They seemed to be abnormal.

Q. And how were the four preceding years?

A. They appeared to be quite normal.

Q. I notice you state here that adopting results which you have adjusted and including depreciation gas at a sale price of 90 cents in Des Moines you have a net revenue available for interest and other charges of $145,173.06. Does that come in a later computation?

A. Yes, it does. I might say I prepared computations on a basis of average operating expenses for four years preceding in order to determine the true working conditions of the company.

Q. Now if you will, take up the fourth proposition and work that out for the Master explaining it to him as it appears on page nine?

A. The table on page 9 is a statement showing the net return as previously determined on a basis of ninety cent gas assuming an actual expense for 1910. The second table is prepared on a basis of ninety cent gas assuming the manufacturing expense for 1910 together with the average distribution expenses for four pre-
3106 ceding years while the third table is on the ba-is of actual manufacturing expenses plus the average distribution charges of five years to December 31, 1910. I then state the return per thousand cubic feet of gas sold to the Capital on the basis of various rates of interest running from five to eight per cent.

Q. Now if you will just take the first row of figures in your table opposite your five cent figure and explain that to the Master as you go through. I don't believe I quite catch all of that. Take the first figure there.

A. On the basis of the revenues set forth on page 6 adopting as a basis ninety cent gas and adjusted expenses, we would have a return

available for interest and dividends of $104,884.98. On a basis of a return of five per cent to the company for a capital of $2,097,701.60.

Q. In other words the return of $104,884.98 as you figure it out under ninety cent gas would bring a return of five per cent upon a valuation of $2,097,701.60.

A. Yes, sir.

COURT: You ascertain that by dividing $104,884.98 by five?

A. Yes, sir. This table is simply a guide. On the basis of a return of five and one half per cent the investment would be $1,907,001.45. On a basis of six per cent the capital would be $1,748,084.66. On a basis of six and a half per cent the capital would be $1,613,616.61. On the basis of seven per cent the capital would be $1,498,358.30. On a basis of a return of seven and a half per cent the capital would be $1,398,467.73. While on an eight per cent basis the capital would be $1,311,063.50.

Q. The second column represents what?

A. The estimated net revenue assuming a ninety cent gas and adjusted expenses on the basis of the four preceding years.

3107 That would give a return of $145,173.06 equivalent to 27.28 cents per thousand feet sold.

Q. That column represents the same method of computation that the first one does on the five, five and a half, six and so forth per cent?

A. Yes, sir.

Q. And the third column?

A. The return is ascertained on the basis of ninety cent gas less actual manufacturing for 1910 and average distribution for five years to December 31, 1910, including last year?

Q. Which you say is an abnormal year?

A. Yes, sir.

Q. That would figure a return of $135,863.22?

A. Yes, sir.

Q. Or 25.53 cents for each thousand feet of gas sold.

A. Yes, sir.

Q. That is a profit?

A. Yes, sir.

Q. The column of figures then below you worked out in the same way you did the first two columns?

A. Exactly.

Q. Did you ascertain from the books the per cent of increase in sales made this year as compared with 1910?

A. Yes, sir. For the first seven months of 1911, compared with the first seven months of 1910 there was an increase of 6.16 per cent or 18,000,000 feet, 18,141 x 180 feet.

Q. And how did you ascertain that fact?

A. From the book records.

Q. From the books of the Des Moines Gas Company?

A. From the books of the company, yes.

Q. The figures with respect to the increase were taken

3108 from the books. We took the actual sales for both periods and ourselves figured out in the increase.

COURT: In getting that $145,173.43 what did you exclude?

A. I consider the operating distribution expense of 1910 to be abnormal and to get a fair estimate of the expense I took the actual expenses of the four preceding years.

COURT: Then you did not exempt anything there?

A. No, rejected nothing.

COURT: Just took the average?

A. Took the average.

Mr. BYERS: For four years?

A. Four years.

Q. That would be——

A. 1906, 7, 8 and 9.

Q. Working that out to get that result you accepted the entires on the complainants' books just as they appeared?

A. In all cases except as previously mentioned rate expenses.

COURT: How did you get the $135,000?

A. I took the average expenses of the five years including the abnormal year of 1910.

Q. Did you ascertain from the books of the company the exact amount of the investment in the Des Moines Gas Company plant?

A. I did.

Q. I wish you would state to the Master what you found it to be and give him the items?

A. The investment or actual cost of this plant accepting the appraisal of 1894 as a basis and deducting the six cents of depreciation already referred to gives an actual investment of $1,481,813.67 in physical properties and in working capital of $68,952.91, a total of $1,550,766.58.

3109 Q. That is for instance that statement $1,550,766.58 represents the total investment of the Des Moines Gas Company less the depreciation which you dedict?

A. Yes, sir.

Q. What is the total depreciation?

Mr. BYERS: That comes a little further over. We might as well have it right there.

A. The total physical property, pages 20 and 21, excluding depreciation and based on an appraisal of 1894, is $1,727,675.67.

Q. Now what does that figure actually represent, that $1,727,675.67?

A. It represents an appraisal of January 1, 1895, prepared by Col. Pratt, $429,426.83, additions shown by the books from January 1, 1895, to December 31, 1910, $1,133,248.84, the cost of the Valley Junction property paid in bonds $45,000, an item not recorded on the books but which appears to be in the plant of a holder, a gas holder I enter $120,000 for.

Q. That is the gas holder which is paid for by the United Gas Improvement Company with $120,000 of bonds.

A. That is the same holder, but we do not know who paid for it or anything about it, no one can tell us.

COURT: You have got it back here $105,000?

A. No, sir; that was another thing, that $105,000 was debt due by the Capital City Company to the United Gas Improvement Company which the Capital City Company paid for in $120,000 of bonds by the Des Moines Company. This other $120,000 in respect to the holder in the works that does not appear in the books of the Capital City Company or Des Moines Company claims was paid for by some one, we can't find who paid for it or anything about it; I put — in at $120,000.

Q. Did you make inquiry of the officers of the company to
3110 furnish you information with respect to that holder?

A. Asked about it several times.

Q. Were you given any?

A. I was given to understand the records were not available.

Q. So if I understand you then you allowed them in making up the total investment in the property you allowed them $120,000 for that hold-r?

A. Yes, sir.

Q. Out of these items you get a total of $1,727,675.67.

A. Yes, sir.

Q. If I understand you that is the amount as shown by the books that was actually put into this property in money barring two items which is the appraisal of $429,426.83, you took that just as it was made by Col. Pratt.

A. Yes, sir.

Q. And $120,000 that you assume to be the fair value of the holder and allowed it?

A. Yes, sir.

Q. And with those two items it makes a total investment in the Des Moines Gas Company, that is all of the money that has gone into it from the beginning up to the 31st day of December, 1910, of $1,727,675.67.

COURT: You don't know whether that represents the money or not in 1895, but includes the appraisement of 1895?

Mr. BYERS: I was barring that item, I take it he assumes that to represent the value up to that time.

A. Yes, that is so.

Q. Now going back where we were. Explain right there and complete that testimony in the record *how* you reduce this amount shown on page 20, $1,727,675.67 to $1,550,766.58, used by
3111 you here in your fifth proposition as capital invested?

A. By deducting the allowance covering depreciation $245,-862.00. That depreciation that showed against the operations of the company and credit the investment account——

Q. That we will find as we go on, how you arrive at that item.

A. Yes, sir.

Q. The difference between $1,550,766.58 and the other figure on page 20 is represented by your depreciation?

A. Yes, sir.

Q. And that total, what do you have to say as to whether that

covers not only the investment in the Des Moines gas plant, but also the investment in the Valley Junction gas plant?

A. It covers them both. The total investment of the company here so far as shown by the books.

Q. When you say here——

A. I mean Des Moines and vicinity, Des Moines and Valley Junction as operated by this company.

Q. In connection with your former answer just what is the figure as shown by the books that represents the Valley Junction investment?

A. $45,000.

Q. Now applying the net revenues referred to by you in your solution four, I wish you would explain to the Master just what returns have been earned by this company on that valuation as you figure them out?

A. On the basis of ninety cent gas and the actual manufacturing and operating expenses for 1910, including an allowance of six cents for depreciation the net revenue would be $104,884.98 equivalent to 6.76 per cent on an investment of $1,550,766.58. Assuming a basis for sales and the actual manufacturing expenses for 1910 and
3112 the averaging operating expenses for the four years 1906 to 1909——

Q. Those are the same four years again and you take them because you find them to be normal average years?

A. Yes, sir.

Q. All right, go on.

A. The net revenue would be $145,173.06, a return upon that investment of 9.36 per cent on an investment of $1,550,766.58.

Q. That is the net investment with depreciation out?

A. Yes, sir. On a basis of ninety cent sales and actual manufacturing expenses for 1910 and the averaging operating expenses for the five years 1906 to 1910, plus the usual depreciation of six cents the net revenue would be $135,863.22 equivalent to a return of 8.76 per cent on an investment of $1,550,766.58.

Q. Now take the expense for 1909 and 1910 as I understand you made some additions to what is shown on the books?

A. Yes, sir. I charged to the expense of the year 1909 the federal tax paid in 1910. I eliminated from 1910 that same tax and added the federal tax paid in 1911.

Q. Then there was a federal tax paid in 1909?

A. Oh yes. Paid in 1910 for 1909.

Q. Paid in 1910 for 1909?

A. Yes, sir.

Q. And that item when found upon the books for 1910 would indicate that it was measured by the income of 1909, is that right?

A. Yes, one per cent of the income of 1909 subject to certain deductions $5000 is the statutory deduction and the interest on bonds and floating debt.

Q. And depreciation?

3113 A. And depreciation if any.

Q. The same would be true if you found in the books of

this company a charge in 1911 for federal tax that would represent the amount due the government from the company for the year 1910?

A. Yes, sir.

Q. And would be measured by the sworn statement of the company to the government as to its gross net income, is that right?

A. Yes, sir.

Q. Now I wish you would go through this summary on page 11 and explain it to the Master just as you have explained the tables that preceded it?

A. That is a statement in cents per thousand cubic feet manufactured of the cost of manufacture at the works less deductions in respect to the proceeds from residuals. The total cost of manufacturing less the residuals for the two months to February 28, 1906, was 36.82 cents per thousand. For the year February 28, 1907, 36.89 cents per thousand feet. For the year February 29, 1908, 35.13 cents per thousand. For the year February 28, 1909, 32.98 cents per thousand. For the ten months December 31, 1909, 30.75 cents per thousand. Average for the four years to December 31, 1909, 34.02 cents per thousand. For the year December 31, 1910, 29.76 cents per thousand. With an average for the five years to December 31, 1910, of 33.04 cents per thousand.

Q. Where did you get the basis of these computations?

A. From the books.

Q. From the books of the Des Moines Gas Company?

A. Yes; unadjusted.

Q. Now what adjustment do you refer to?

3114 A. I made no adjustment on the books.

Q. So that this manufacturing cost as it appears here is taken from the books of the Des Moines Gas Company?

A. Entirely.

Q. And is correctly set forth here as it appears on the books of the company?

A. It is.

Q. Checked up by you?

A. Yes, sir.

Q. And in making up the figures you have assumed that the entries in the books represent the cost of the several items?

A. I have.

Q. Now did you find anything unusual in the way of repairs in 1910 or any extraordinary repairs of any kind?

A. They seemed quite heavy as compared to the preceding years.

Q. What did you find with respect to that?

A. In 1910 the repairs cost 2.55 cents per thousand as compared with an average for the preceding four years of 1.71 per cent per thousand, for 1.91 per thousand for the ten months to December, 1909, 1.21 per cent per thousand for the year to February 28, 1909, 1.46 cents per thousand for the year February 28, 1908, 2.32 cents for the year to February 28, 1907, and 2.05 for the two months to February 28, 1906, an average for the five years to December 31,

1910, of 1.09 cents per thousand as compared with 2.55 cents for the year 1910.

Q. That is the average of repairs?

A. Average in repairs.

Q. Now again in dollars and cents the total amount, what did you find it to be for these years you have used in getting at your average?

3115 A. For the two months, February 28, 1906 $1,370.91. For the year to February 28, 1907, $9,699.99. For the year February 29, 1908, $6,875.23. For the year February 23, 1909, $5,966.71. For the ten months December 31, 1909, $8,213.18. For the year December 31, 1910, $14,193.78. A total of $46,279.80.

Q. And that amount was distributed over the plant generally or was it used largely in some particular part of it?

A. No it appears to be quite largely used on remodeling the water gas apparatus and coke shed apparatus.

Q. Just what proportion of it was used at the plant I mean down here on the east side of the river?

A. The actual works?

Q. Yes.

A. All the expenses just mentioned were used in the plant, the manufacturing plant.

Q. And were these items taken from the books of the company?

A. Entirely.

Q. Now if you will go through the dist-ibution in the same way Mr. Hall was rapidly as you can and do the matter justice?

A. The distribution expense includes complaints, distribution office expense gratuities, works repairs to the mains services and meters, setting and removing meters street mains store room and stable expense. Total for the two months February 28, 1906, 5.82 cents per thousand sold. For the year February 28, 1907, 4.67 cents per thousand. For the year February 29, 1908, 5.44 per thousand. In all cases sales. For the year February 28, 1909, 5.32 per thousand. Ten months to December 31, 1909, 6.60 cents per thousand. Average for the four years 5.52 cents per thousand. For the year December 31, 1910, 8.49 cents per thousand. Aver-

3116 age for five years to Decembe- 31, 1910, 6.21 cents per thou-snd.

Q. Now commercial expenses?

A. Commercial expense includes expense of collection and of-ice expense, office salaries and proportion of the general management and was a total for the two months to February 28, 1906, of 7.92 cents per thousand feet sold. The year to February 28 1907, 7.56 per thousand. The year February 29, 1908 7.31 cents per thousand. For the year February 28 1909, 7.57 cents per thousand. The ten months December 31, 1909, 8.34 cents per thousand. Average four years to December 31, 1909, 7.67 cents per thousand. For the year to December 31, 1910, 9.01 cents per thousand. The average for five years to December 31, 1910, 7.98 cents.

Q. Was this expense increased quite considerably during the year 1910 over the average of the former years?

A. Yes, it goes up quite a good deal, 9.01 cents in 1910 as against an average of 7.67 an increase of 1.34 cents.

Q. How was that additional expense apparently absorced, how did it show on the books what it was covered by?

A. Just a general increase in the running expenses of the office a more liberal policy.

Q. Any increase in the salary list?

A. Yes, my recollection is that in 1910 the sal-ries went up right down the line, all salaries went up, increases to every one in 1910, or almost everyone. I might say that the expense for 1910 included the cost of an added machine and a calculatin- machine.

Q. And what did they cost?

A. The adding machine $623.64 and the calculating machine $225.

Q. These figures covering commercial expense do they cor-
3117 rectly show just what the Des Moines Gas Books show unadjusted?

A. Exactly as their books unadjusted.

Q. No additions or subst-actions?

A. No additions and no deductions.

Q. Now the new business.

A. The new business includes the expense of advertising appliances, demonstrations, expenses soliciting, gas appliances, gas engine expenses, house fitting expenses, etc., including an allowance for general management, cost the two months ending February 28, 1906 4.38 cents, the year to February 28, 1907 4.76 per thouasnd sold for the year to February 28, 1908 4.36 cents per thousand sold the year to February 28, 1909 2.96 per thousand the ten months to December 31, 1909, 3.93 cents. Average for the four years 3.98 cents. For the year to December 31, 1910, 4.54 cents. For the five years an average of 4.11 cents per thousand sold.

Q. Now was there any adjustment made by you in respect to any of these expenses?

A. None.

Q. Just as they appear on the books of the company?

A. Just as they appear.

Q. The total averages you have given are correct averages?

A. They are.

Q. Based on the sales as shown by the books of the company.

A. Yes, sir.

Q. Now the advertising expense you find to be considerable increased do you not?

A. Yes, sir.

Q. No the year 1910, how was that shown on the books?

A. By general increase in the expense of advertising, sala-
3118 ries and other expenses including very considerable payments to the U. G. I. for advertising literature.

Q. The United Gas Improvement Company of Philadelphia?

A. Yes, sir.

Q. And the soliciting expense increased, now how did you find that was accounted for on the books?

A. Due to an increase in salaries, general increase.

Q. In what year?

A. For both 1909 and 1910, beginning about the latter half of 1909 I think.

Q. Do you have any memorandum handy from which you can tell just when the increase in salaries began?

A. We have it, I can get it for you. I don't have it beside me now.

Q. Was there any of that prior to the year 1909?

A. No my recollection is that the years before that was somewhat more normal increase in the way of salary raises.

Q. Now the general expenses.

A. General expenses include accident or damage claims association meetings, general expenses, extra expenses, insurance litigation, street lamp operating and salaries general. The cost for the two months to February 28th, 1906, was 1.36 cents per thousand. For the year to February 28, 1907, 2.68 cents. For the year to February 29, 1908, 2.19 cents. For the year February 28 1909, 2.49 cents, for the ten months to December 31, 3.78. Average for the four years to December 31, 1909, 2.72 cents. For the year to December 31, 1910, 4.90 cents per thousand. The average for the five years December 31, 1910, 3.22 cents per thousand.

3119 Q. I notice from your statement that the total for the year 1910 was over two cents higher than the average for the four preceding years?

A. Yes, sir.

COURT: That includes the $10,000 there does it?

A. It does.

COURT: That is figured in the year for December 31, 1910?

A. Yes, sir.

COURT: Take that $10,000 out, what would it be?

A. 3.02 cents per thousand sold. The 1.88 cents is the $10,000, that is the only item in that.

Q. Then if I understand you the 1.88 is an added expense to the year 1910 and is absorbed entirely by the $10,000 in alleged salaries to the employés of the U. G. I.?

A. Yes, sir.

COURT: I don't understand this fully now. You put salaries there 1.88 in 1910. That is general salaries. Is that an increase or the total salaries?

A. The 1.88 is on the basis of $10,000 per annum to four or five U. G. I. officials.

COURT: That don't mean salaries to the manager?

A. Oh no, excludes the manager and all local officials, covers Mr. Bodine, Mr. Clark, Mr. Lilley, Mr. Douthirt and Mr. Pearson.

Q. You don't include in this list chargeable there the salaries of the men and the manager of the concern do you?

A. No, sir.

Q. Where are those salaries taken care of?

A. They are spread over the business. In the office and commer-

cial expense, monthly distribution, office salaries, they are mostly in distribution and commercial.

3120 Q. In 1909 you have .10 of a cent?

A. That is the average four years to December 31, 1909.

Q. There would be a little there, a month of that $10,000?

A. Two months. 1909 includes two months. Commenced paying salaries November 1, 1909.

Q. This $10,000 extra?

A. Yes, sir.

COURT: What is that .41?

A. That re-resents two months' salaries some officials drew during the year 1909, they commenced paving November 1, 1909.

Q. I was in the wrong column when I asked you about the .10 cents the third column on the end represents the average for the four years?

A. Yes, sir.

Q. And the .41 represents the two months that these extra salaries were paid in the year 1909?

A. Yes, sir.

Q. Now you may give such further explanation as you wish with respect to these extra expenses as you have apparently done on page 15, explain that page to us?

A. There is an average charge during five years December 31, 1910 of .56 per thousand and of .75 per thousand during the year to December 31, 1910 in respect to the account called expense extras, that account covers donations, subscriptions, charities, club subscriptions, bonuses and a few more.

Q. Was there an apparent increase in this during 1909 and '10?

A. Yes, steadily riwing. For the two months February 28, 1906, that cost $27.50. For the year to February 28 1907, that was $1,914.50. For the year to February 29, 1908, it was $1,371.65. For the year to February 28, 1909, cost $2,062.31. Ten

3121 months to December 31, 1909, $3,392.35. For the year to December 31, 1910, cost $3,964.78.

Q. Then if I understand you that class of expense extra for 1909 and 1910, or for 1910, was $3,964.78?

A. Yes, sir.

Q. And what do you say that covered, what is included in these figures. I note you say in one place here bonuses. What do you mean by that?

A. $200 in 1910 was given to a club, club subscriptions. Y. M. C. A. $100. Methodist Hospital $100. Greater Des Moines Committee $2,225. Roadside Settlement $50. Mercy Hospital $400. Sundries including Mr. Haines' expense extra $178.78. Item donation to J. Haines $711.

Q. Those items you have just read are covered by this item here under the year ending December 31, 1910, $3,964.78?

A. Yes, sir.

Q. I wish between adjournment and the coming on of court in the morning you would have these items typewritten and furnished to me on a separate sheet.

A. For one year or five?

Q. Better have it for both years, 1909 and 1910?

A. All right.

Q. Now what further comment, if any, do you care to make or explanation of the salaries general?

A. The salaries were placed on the books in the first instance on November 1, 1909, or from that time, and they carry $10,000 per annum.

Q. Now do any of the persons to whom a credit for salary appears on the books, had they ever drawn salary from the company before, so far as the books show?

3122 A. Not so far as I ascertained.

Q. Did you find in your examination any vouchers showing payment of any of these salaries or of receipt for any of these salaries?

A. My recollection is the salary checks were endorsed each month by these parties.

Q. Their names appear on the salary check?

A. Yes, sir.

Q. And who drew the checks, where were they drawn, here or somewhere else?

A. Here I presume.

Q. Do you know how those entires got on the books? Did you find anything or did your men find anything among the papers of the gas company to show how these entries came to be made on the books here?

A. I don't know that I quite follow you.

Q. Well for instance at the end of the year or whenever the entry was made on the books did you find anything indicating that these entries were directed by letter or communication or otherwise from some person or company?

A. No, they were authorized by minute of directors and are placed on the books monthly just as they pay the ordinary force.

Q. All you found then was the transaction in the directors' or stockholders' minute book and then each month these several persons were credited with——

A. They had a check sent them each month?

Q. You are sure about that are you?

A. Quite certain.

Q. Sure about that that among the vouchers up there will be found checks for these salaries.

3123 A. Checks or vouchers of some kind; voucher checks I think they are.

COURT: Who drew the checks?

A. Drawn by the cashier in the office, I don't know his name.

Q. If you have any doubt about that I would like to have you verify it between adjournment and coming in court in the morning and I would like to have you bring with you if the manager of the gas company will permit you to have them, these vouchers or checks.

COURT: Do you know whether or not they were drawn by S. G. Bodince?

A. Yes, drawn to them individually.
COURT: Did he draw these checks?
A. He did not draw them, but made — payable to Mr. Bodine.
COURT: I know, but did he draw the checks on the treasurer?
A. The treasurer drew them on the Des Moines Company.
COURT: Did the secretary draw them?
A. I could not say which official drew the checks.
COURT: You don't know who signed them?
A. Signed by an official here.
Mr. BYERS: In that expense extra have you tab-lated the expense extra for the several months since the first of January 1911?
A. No.
Q. What I want to know is whether you have made up a table of the extra expenses since January 1911?
A. No.
Q. So that you can't say now whether this increase has been continued?
A. I can't say.

Q. Do you have on that memorandum that you submitted
3124 a moment ago or that you used in refreshing your recollection as to items making up the total of $3,964.78 for 1910, do you have on that memorandum the amount of increase of salary to the manager or president of the company?
A. No.
Q. That does not show there?
A. No, this is simply a record of the extra expense.
Q. Now one further item there so that there will be no question about how you deal with it, on page 16 of your report I wish you would explain a little more fully just what that item included and why you exclude it from your computations in arriving at the cost of manufacturing gas.
A. That item $5,935.18 was in most part paid to the U. G. I. of Philadelphia for the service of draftsmen and engineers preparing the inventory and was worked for the plaintiff here connected with this present suit.
Q. $5,935.18?
A. Yes, sir.
Q. How was that expense entered on the books of the Des Moines Gas Company?
A. It was mostly entered from voucher.
Q. I don't mean the method or manner in which entered, what did they call it, litigation expense, or what?
A. Replacement value, rate regulation expense.
Q. Do you have some memoranda showing that?
A. Not a copy of the account.
Q. You have handed several pages here covering items under the title Des Moines Gas Company, rate litigation expense, 1909, 1910. Is this supposed to be an abstract from the company's books?
A. Yes, sir.
3125 Q. Just as it appears there?
A. Yes, sir.

Q. Defendant's Exhibit No. 31 identified by the reporter is the abstract of the company's books covering this item of $5,935.18?

A. Yes, sir.

Q. Before I go any further there were any of these extra salaries if I may use that term allowed and any item showing any such salaries appearing on the books prior to November 1, 1909?

A. No, none.

Q. Now you may state to the Master further if you care to just why that item $5,935.18 should not be credited up to operating expenses?

A. It should not be charged to operating expenses as it is not an annual recurring charge and is not one directly connected with the operating of the business. It is a special charge and should be specially taken care of.

Q. And for that reason you have excluded it all through your computations?

A. Yes, sir.

Q. Now then taxes?

A. Taxes include general taxes, federal tax and special city tax, covering two months February 28, 1906 amounted to 6.14 cents per thousand. For the year to February 28, 1907, 5.56 per thousand. For the year to February 29, 1908, 6.87 cents per thousand. For the year to February 28, 1909, 6.52 cents. For the ten mon-hs to December 31, 1909, 7.66 cents. Average for four years to December 31, 1909, 6.65 cents. The year ending December 31, 1910 7.22. Average for the five years to December 31, 1910, 6.78.

Q. You don't find any abnormal increase in the tax account?

A. No, the tax account appears to run quite normal.

3126 Q. Have you abstracted the books so far as the tax entries are concerned? Let me put that question in another way, the taxes that you have just stated, the totals are they shown by the books of the company just as you gave them?

A. Yes, subject to the throwing into this expense of the federal tax of 1910 and 11, we take that in as an expense under the head of taxes.

Q. Now leakage?

A. I find the average of leakage for five years 2.04 cents per thousand as compared to 1.35 cents for the year 1910 and 2.26 cents for the four years from 1906 to 1909.

Q. There was less of that kind of leakage in 1910 than usual?

A. Yes, things improved in 1910.

Q. Now take up your conclusion No. 2 and go through that for us if you will?

A. That conclusion stated on page 17 is a summary of the total repairs on the plant and distribution system covering the period of five years from December 31, 1910. The repairs for the two months to February 28, 1906 total 4.82 cents per thousand. For the year February 28, 1907, 4.88 cents per thousand. The year February 29, 1908, 4.61 cents. For the year February 28, 1909 4.45 cents. The ten months to December 31, 1909, 5.73 cents. Average for four

years to December 31, 1909, 4.89 cents. The year to December 31, 1910, 7.42. Average of five years to December 31st, 1910, 5.49 cents.

Q. That represnets the total amount paid out for repairs during that period?

A. Yes, sir.

Q. You add something to that do you?

A. We add six cents per thousand in respect to depreciation.

3127 Q. For each year.

A. For each years, yes.

Q. That changes the totals just to that amount?

A. Yes, six cents greater.

Q. I wish you would explain to the Master just how that six cents works out on this investment as you have extended it up to this point?

A. Six cents per thousand cubic feet sold during the period from January 1, 1895 to December 31, 1910, would give an aggregate depreciation of $245,862.00.

Q. You have a table at the bottom of page 17?

A. Yes, and the amount is in the middle of page 18, $245,862 aggregate depreciation in the sixteen years.

Q. So the total depreciation in the years figured as you figure it at six cents per thousand cubic feet amounts to a total of $245,862.

A. Yes, sir.

Q. And that was the amount that you used to arrive at the figure $1,550,000 of investment?

A. Yes, sir.

COURT: You do not give the six cents a thousand cubic feet of gas in this table on page 18, you do not give the amount of gas manufactured do you?

A. I think I have it here somewheres.

COURT: I suppose dividing that by six would give it?

A. That gives the -igures.

Q. You took the actual amount of gas manufactured each year?

A. Took the actual figure.

Q. Multiplied it by six cents?

A. Yes, sir.

3128 Q. That gave you the figures appearing for each year in this table and the final total $245,862.00?

A. Yes, sir.

Q. That will be found in schedule 4 attached to this report, under general statistics schedule 4 for the years 1895 to 1910?

A. Yes, it is given there the seventh column from the left of the page would give it.

Q. That is the fourth one from the end?

A. Yes, schedule 4, the footing of that would give it.

Q. At any rate Mr. Hall, you took the actual sales as shown by the books of the company and used the figures.

A. Yes, sir.

Q. For the basis of these columns that total $245,862.00?

A. Yes, sir.

Q. And you arrive at the total for each year by multiplying the sales of that year by six cents.

A. Yes, sir.

Q. Now I wish you would explain briefly the last column in that table beginning on page- 17 and 18?

A. That represents the percentage of the depreciation allowance to the investment of the company, to the investment in plant, physical property as at the close of that particular year. For example at the close of the year 1895 the depreciation allowance was equivalent to .0836 per cent of that figure. The allowance was calculated on the closing balance of each year, the last figure of the year irrespective of the fact that the additions only were in use for six months and no account was taken of any residual value at all or any real estate?

Q. If you had taken account of residual value and real estate what difference would that have made?

3129 A. It would have raised the percentage.

Q. Now if you will take up your conclusion No. 3 and work that out for us I would be obliged to you?

A. Conclusion No. 3 sets forth the estimated return to be earned on a basis of the actual expenses of the year 1910, on a basis of the actual manufacturing for 1910 and average distribution expenses for the four years 1906 to 1909 and third, on the actual manufacturing expenses of 1910, and the average distribution for the five years including 1910, including as an expense the depreciation.

Q. And how does it work out?

A. It works out on page 20 giving an estimated net revenue at actual manufacturing for the year 1910, and the distribution for the four years 1906 to 1910, including depreciation, an estimated net revenue of 27.28 cents per thousand feet sold. Assuming ninety cent gas in Des Moines and the usual Valley Junction rates. On the second table assuming the same revenue and the actual manufacturing expense for 1910 and the distribution based on the average for the years 1906 to 1910, including depreciation we have a net revenue available for interest of 25.53 cents per thousand feet sold. Stated in dollars and cents the first estimate, that is on the basis of the average distribution expense for 1906 to 1909 would give a net revenue of $145,173.06.

Q. That appears on page 19?

A. Page 19. While under the second basis of five years' average including 1910 the average distribution gives a net revenue of $135,863.22.

Q. Just a little under $10,000 difference in the two estimates?

A. Yes, sir.

Q. Now conclusion No. 5.

3130 A. Deals with the investment in the property of the company and brings out after making a deduction for depreciation to investment brings $1,550,766.58.

COURT: Did you take the working capital from the books?

A. Yes, sir.

Q. Now what did you include in that?

A. I included all the working assets representing cash on hand inventory of supplies and accounts receivable and deducted the accounts payable and accrued liabilities. That is the liability for bond

interest due and unpaid covering a few months. I refer to that in detail later on.

Q. This item of $68,952.91 was that taken from the books of the company?

A. Yes, sir.

Q. That is the separate items that make up that total are shown on the books of the company?

A. Shown on the balance sheet December 31, 1910.

Q. And shown as working capital for that year?

A. Yes, sir. This statement brings out that investment as by the company's own books after deducting depreciation, that is money invested in physical property or working property.

Q. Now I wish you would go through that a little more in detail and work it out the same you have here in your report with such explanations as you care to make.

A. We started under the appraisement of January 1, 1895, and that appraisal amounted, that is physical property excluding any working assets amounted to $429,426.83 and the company expended for additions between January 1, 1895 and December 31, 1910, $1,133,248.84. They paid for the valley Junction property *in*
$45,000 in bonds. Added allowance for the gas holder not
3131 included in either set of books $120,000.

COURT: Right there I want to get at something. On page 3, you make reference to a payment by delivery of bonds received of $120,000. Now is that the $120,000 which you refer to here?

A. No, sir; it is another additional $120,000.

COURT: This $120,000 was for the gas holder?

A. Perhaps I could explain it better in my own way. The Des Moines Company gave the Capital City Company $285,000 in first mortgage bonds. $45,000 of that $285,000 covered the Valley Junction property. $120,000 of this $240,000 remaining was given by the Capital City Company to the U. G. I. in settlement of a debt of $105,526.49.

COURT: What was that for?

A. For supplies sent by the U. G. I. and moneys advanced by the U. G. I. to the Capital City Company. That $120,000 was in liquidation of a debt. The remaining $120,000 of bonds plus $800,000 preferred contracts, plus the capital stock of the Des Moines company was distributed by the Capital City compa*j*y to its stockholders by way of dividends. That is the $120,000. The question came up when this appraisal was made as to the holder being in the yard and not being on the books and the contention appears to be although it is not fully proven, that this $120,000 of bonds instead of being distributed as dividends was handed to the U. G. I. company in payment of the holder, the other $120,000.

Q. Carrying that a little further, if I understand the situation as you found it, substantially all of the physical property, the important part of it, can be found, can be traced into the books of either the Capital City Gas Light Company or Des Moines Gas Company, except this one holder?

3132 A. I only had the one holder not being in either set of books.

Q. And that holder is the one that you allowed and you figure out that probably the other $120,000 of this $240,000 was to wipe out that indebtedness or rather that credit if it had been on the books, or charged?

A. I understand through I think Mr. Curren comptroller of the U. G. I. that $120,000 was in connection with the holder.

COURT: Mr. Douthirt testified there was $120,000 paid for the holder if I understand it.

A. I confirmed the $120,000 by asking Prof. Bemis if the holder was worth about $120,000 and he said yes, just about the price of it so I passed up the $120,000 on that basis.

Q. Now then if you will go on with your investment in plant and property.

A. The investment in the plant and property on the basis of this appraisal, subsequent additions Valley Junction property and the holder aggregate $1,727,675.67. From that amount we deduct the allowance in respect to depreciation or being equivalent to the wear and tear of the plant, decrease in its value, $245,862.00 leaving the depreciated value of the property at $1,481,813.67.

Q. Then if I understand you at this point you took the total sales of the company for the five years and multiplied them by six to get the depreciation.

A. No, sir; I took the sales for the sixteen years and multiplied it by six. The question was asked a moment ago as to the total sales they were 4,097,700,000 in round figures for sixteen years, page 21.

Q. You multiplied that by six to get the depreciation?

A. Yes, sir.

3133 Q. That produced the figure $1,481,813.67?

A. Yes, sir.

Q. And according to your investigation and examination represents the total amount invested in this property by all of these companies less your depreciation?

A. Yes, sir; accepting the appraisal as the start.

Q. Accepting Col. Pratt's appraisal back in 1895 as the start?

A. Yes, sir.

Q. And why did you do that?

A. That appears to be accepted by all parties at that time as being the price of the property or value of the property as appraised prepared by the company and it was the reasonable assumption that represented the actual facts at that time.

Q. Prepared it themselves?

A. Prepared it themselves and swore to it.

Q. Swore to it as the actual value?

A. Yes, sir.

Q. So you started with that?

A. I started with that, that being the cleanest point to commence.

Q. Does that appraisal appear here?

A. Yes, sir; the following table, page 21 gives a summary of that appraisal.

Q. Where did you get these figures?

A. From a copy of the appraisal on the record.

Q. I wish you would explain a little more fully what is covered by that table?

A. The main sections of the plant here as stated. Then the total investment in each section. The second column is the appraisal of January 1, 1895, the Pratt appraisal. The next column gives the total additions made to the plant subsequent to that date.

3134 The two last columns give the additions for the period January 1, 1895 to 1906 and the last column March 1, 1906 to December 31, 1910.

COURT: What does this total mean?

A. Means the total investment as $1,727,673.67, represents the total of the appraisel value with subsequent additions. The second column is the appraisal of January 1, 1895, the Pratt appraisal.

COURT: These totals are your own figures?

A. My own figures, yes.

COURT: You don't know whether that appraisal represents book value at that time or not?

A. It does not.

COURT: That last column represents the addition between March 1, 1906 and December 31, 1910?

A. Yes, the additions made by the Des Moines Company, the present company.

COURT: The column next to that represents the additions made by what is known as the Capital City Company?

A. Yes, sir.

COURT: After 1895?

A. Yes, sir.

Q. And including 1895?

A. No, the second to the last column represents the additions from January 1, 1895 to February 28, 1906.

COURT: That includes 1895?

A. Includes 1895 yes, I misunderstood you.

MR. BYER: What does the first column include?

A. Represents the total of the plant now with the appraisal as the basis.

Q. And without the depreciation taken out?

3135 A. Without, yes.

Q. And without Valley Junction and without that holder?

A. No with both at the bottom of the page.

Q. When you get down to the bottom, but where you say total as on the books?

A. Yes, without the Valley Junction property and without the holder.

Q. And the second column is the appraisal made in January 1895?

A. Yes, sir.

Q. Which is included in these figures $1,562,675.67 in the first column?

A. Yes, sir.

Q. That is, you do not mean that this table does not indicate that

the total cost as shown by the books was $1,562,675.67 and then the appraisal of $429,426.83 in addition, that is not what it means?

A. No. It means that the figure $1,562,675.67 is the appraisal plus the subsequent additions.

COURT: That is only physical property?

A. Physical property only.

COURT: You did not take into consideration any expense of organization of the Des Moines Company?

A. No, sir.

COURT: This simply gives the actual physical property as represented by investment?

A. Yes, sir.

COURT: Shows the amount actually put into property.

A. Into tangible property.

Q. Represents all that was put in?

A. As shown by the books, yes.

3136 COURT: You mean all if that appraisement is correct?

A. Assuming the appraisement to be correct at the commencement, yes.

Q. Of course I am assuming that all the time in these questions that that is correct. Now the property of the company as shown on the books, Mr. Hall, at the present time, the book entries, $3,853,975.22 which is very greatly in excess of the amount that you say the books show was invested in the property assuming that the appraisal in 1895 was correct. How do you explain that and account for that excess?

A. Partly by the fact that the appraisal of January 1, 1895, was less than the books. Partly by the fact that in 1897 the value of the plant was arbitrarily run up by an appreciation and credit to surplus and finally by the transfer by the Capital City to the Des Moines company at a very considerable enhancement.

Q. I wish you would cover that a little more in detail?

A. The book value of the properties on December 31, 1910, was $3,853,975.22. That figure was determined after taking out depreciation June 30, 1909, $264,108.78. Adding these two figures together would reinstate the book cost of the Des Moines company to the sum of $4,118,084.00. To determine the difference between that sum and the actual cost of the property as already referred to is made up by a difference of the book value at January 1, 1895, in excess of the original appraisal at that time referring especially to the water gas plant and patents shown on the books at $200,000 and appraised at $27,903.06.

Q. That is to say the company itself valued the property that had a book value of $200,000 at $27,903.06?

A. Yes, as I understand it the old company took over the water gas plant and issued bonds against it in the face value of $200,000. The property at the time of this appraisal was entered at $27,903.

January 1, 1895, the construction account appeared on the
3137 books which represented stock issued without consideration another $39,371.22. That made the book value January 1, 1895, $211,468.16 in excess of the appraisal by Col. Pratt. During

the subsequent period to February 28, 1906, the capital account of the Capital City Company was charged with the cost of certain stocks in the Capital City Electric Light Company less dividends received a net figure of $2,553 and also include a charge of $131,744.44 an amount charged to plant account credit to profit and loss and subsequently distributed as stock dividend, $300,000 was distributed as stock dividend May 1, 1897, and include this item. These two items make $134,297.44. When we come down to the transfer of the Capital City Company to the Des Moines Company we find that there was an appreciation there of $2,123,769.91.

Q. Now how did that come about, that appreciation?

A. Oh generally called water. They sold the property at a sum very considerably in excess of its book value at that time. The book value of the plant as appearing on the Des Moines Company's books of March 1, 1906, $3,592,723.24 less the Valley Junction properties $45,000 making a net value paid to the Capital City Gas Light Company $3,547,723.24 against a value appearing on the Capital City books of $1,423,953.33.

Q. That is to say the Des Moines Gas Company issued and changed its securities in the amount of $3,547,723.24 for property of the Capital City Gas Light Company of the value of $1,423,953.33.

A. Of the apparent value of $1,423,953.33 because that value included the previous appreciations we have mentioned, that is a book value only.

Q. So that the actual value would be even less than $1,423,953.

A. Yes, would be subject to a deduction of $211,468.16
3138 and $134,297.44 mostly making up that appreciation. Then to these three items amounting to $2,469,535.51 I added the bond discount and reorganization expense charged to the plant on the Des Moines company books. That represents principally the discount on bonds sold $40,872.82 making a total deduction of $2,510,-408.33 leaving the actual cost of the property as shown by the Des Moines company books, $1,607,675.67.

Q. In other words, you found by your investigation and examination of the Des Moines Gas company books that there was $2,510,-408.33 in water?

A. Yes, sir.

COURT: That is up to the time of the organization of the Des Moines Gas Company?

A. Yes, sir.

COURT: Does that include up to the present time the extension?

A. No, sir; that is purely water or arbitrary additions without tangible value being represented.

Q. What does the $1,607,000 represent?

A. That plus $120,000 on the holder represents the total cost to this company up to this time beginning with the appraisal.

Q. Up to the 31st of December, 1910, or up to this time?

A. Up to December 31, 1910.

Q. When you add to this actual cost of the property $1,607,675.67

the $120,000 that you allow for the holder it brings the total cost up to your former figure $1,727,675.67.

A. Yes, sir.

Q. And that represents the actual cost of the entire property without any deduction for depreciation?

A. Yes, and based on the appraisement.

Q. Based on the appraisal of 1895. Now you have stated
3139 this in another way on this same page 23. I wish you would explain that?

A. The appreciation on the transfer including the other appreciation amounted to $2,510,408.33. The company itself wrote off on June 30, 1909, $264,108.78 while we allow a value for the holder not included on either set of books namely $120,000, take the two items from the appreciation of $2,510,000 we have an appreciation excluded from the accounts of $2,126,299.55. In other words the balance sheet of the company December 31, 1910, is $2,126,299.55 in excess of the amount invested in the plant as we make it out.

Q. Now right at that point did you find or were you able to ascertain just why the amount $264,108.78 was charged off for depreciation?

A. I don't know why it was done.

Q. Do you know how they got at those exact figures?

A. Yes, June 30, 1909, the amount credited to profit and loss account representing surplus earnings from March 1, 1906, to June 30, 1909, after paying all interest charges was $264,108.78 and that figure was taken and transferred to the credit of plant account, the profit and loss account being closed up.

Q. In other words they took their surplus, what appeared to be surplus earnings and wiped it out by charging it up to depreciation?

A. Yes, sir.

COURT: Is that more or less than you figure the same account?

A. Oh very considerably more. That only covered a period of three years and four months.

Q. That would be the amount they would charge since 1906 would it not?

3140 A. From 1906 to June 30, 1909, they closed the account out at that date.

Q. Your depreciation account for the whole sixteen years was only $245,000?

A. Yes, less for the sixteen years than they make for the three years.

Q. They wiped out more in the three years than you did the whole sixteen?

A. Yes, sir.

Q. It happened to be just the amount of surplus owned as shown by the books?

A. Yes, sir.

Q. Was there any other reason given for it to you by anyone for the company?

A. No.

Q. Has that item, that amount been included so far as you have been able to ascertain from the books in any of their statements?

A. Not as an expense, no.

Q. Well as depreciation?

A. Yes, the balance sheet shows that.

Q. But in the sworn statements they have made for the last two years and made since that depreciation charge appeared on the books has it appeared in any of those statements?

A. Not so far as I have seen them.

Q. I mean so far as you have been able to find?

A. No. Certainly has not appeared in the federal tax statement, be no tax to pay if it did.

Q. That would wipe out the tax?

A. Why yes. There would have been something coming back in that event.

3141 Q. They did pay federal tax?

A. Yes.

Q. Quite a considerable sum didn't they?

A. $1237.00 or $1287 for the year 1910. $1287 for the year 1910.

Q. And if they had regarded this $264,108.*00*.78 as a legitimate entry on their books they would not have paid any such sum.

Objected to as argumentative and clearly incompetent, it is not for the witness to say if they regarded this as a legitimate entry or what they would have done if they has so regarded it.

Q. I will put it in another way. If such a charge appeared upon the books of this company at the time the sworn statement to the federal government was made with respect to the income and revenue of that company does the federal statute require that amount to be stated, the depreciation amount to be stated in the blank.

Objected to as clearly incompetent because the federal statute speaks for itself and the witness is not competent to interpret it.

A. The federal statement provides for any depreciation charged as an operating expense being deducted from the net revenue of the company before paying tax.

COURT: Depreciation for that year?

A. The depreciation applicable to the year being reported on, yes.

Q. So when you found a federal tax for the year 1909, paid for the year 1909, and then found this charge for depreciation you were put upon inquiry were you not and made some inquiry about it?

A. I figured the matter out roughly for myself to ascertain if this had been included as an operating expense.

Q. Have you been able to figure out any method of depre-

3142 ciation that would bring about any such item as you find on the books there for those three and a half years?

A. No.

Here the further hearing was adjourned until 9:30 A. M. tomorrow.

3143 Wednesday Forenoon Session.

SEPTEMBER 13, 1911—at 9:30 A. M.

Counsel for the respective parties all present.

Testimony on part of defendants resumed as follows:

JAMES HALL, continuing his direct examination, examined by H. W. Byers, Esq., testified:

The MASTER: Before we begin the further examination of this witness, there are some matters here with reference to these books that I wish to have cleared up. On page 5 of Exhibit 23 I find a table of Mr. Hagenah that shows the book value of this property $1,928,016.65. The basis for that is the alleged book value on June 30, 1886 $295,383.08; adding to that the extensions in various ways up to and including January 1st, as I understand it, I find that up to that time it would amount to $470,173.66. That brings it up to the date now that you begin the valuation and that only makes a difference in your basis of $40,746.83. I find the total difference in the final results of the book value between the two experts is $200,340.98, making a difference in round numbers of $160,000. or about that. Now I would like to know why that difference. It ought not to exist; if your experts can explain that, I would like to have it done.

Mr. BYERS: Mr. Hall can explain that.

The MASTER: All right, I want it explained in order to get at it right.

The WITNESS: I can explain that, I think. In the year ended February 28, 1907, Mr. Hagenah enters the extensions total at $418,914.28. That figure includes the $120,000 paid to the United Gas Improvement Company in settlement of the old debt of $105,000.

3144 The MASTER: That includes the $120,000?

A. Yes, sir. In other words, Mr. Hagenah entered as extension $285,000 bonds issued at the time of the reorganization of the Company, while we only included $165,000. excluding as an extension $120,000 covered in settlement of the old company obligation.

The MASTER: Now just make the figures here showing the difference.

A. I have stated the figures in even thousand dollars.

The MASTER: I got it $200,340.98. Please see whether that is right.

A. That is correct.

The MASTER: Then the difference is $200,340.98. I wish you would take down the amounts as I read them: $295,383.08; $13,393.52; $30,588.09; $11,606.56; $7,462.52; $32,565.24; $68,402.36; $5,615.02; $5,157.27. Now add that, please.

A. $470,173.66.

The MASTER: That is what I have it. Now, Mr. Hagenah, I want to see if I got that correct; that will bring it up to ninety-four. Now should that minus quantity be taken out?

Mr. HAGENAH: Yes, sir.
The MASTER: That should be taken out for 1894?
Mr. HAGENAH: Yes, sir.

The MASTER: Now take from it $149.32.
The WITNESS: $470,024.34.
The MASTER: Your basis now is *is* $429,426.83?
A. $429,426.83.
The MASTER: I wish you would see what the difference is?
A. $40,597.51.

The MASTER: That is what I have it now. That makes a
3145 difference then in the basis of $40,597.51?
A. Yes, sir.
The MASTER: Now take that from the two hundred.
A. I have just the figures to the even cents now and the difference is $201,470.33, made up of the difference of the bonds and the bond discounts; and the unexplained difference is $1,129.35——
Mr. BYERS: Explain that now.
A. The construction on Complainant's Exhibit 23 is $1,928,-016.65. The construction on Defendants' Exhibit 30 is $1,727,-675.67. Complainant's Exhibit being in excess of defendants' $200,340.98. That is partly explained by the difference on January 1, 1895, between the accounts taken from the books $470,024.34 accepted by the complainant, and the Pratt appraisal accepted by the defendant $429,426.83, a difference of $40,597.51. Adding to that the bonds paid to the United Gas Improvement Company by the Capital City Company in settlement of the open account March 1, 1906, $120,000; add to that the bond discount and reorganization expenses for the period from 1906 to 1910, $40,842.82, making a total of $201,470.33. The other exhibit gives $200,340.98, and there is an unexplained difference of $1,129.35.
The MASTER: Between your Exhibit No. 30 and the Complainant's Exhibit No. 23?
A. Yes.

The MASTER: That is all I wanted to know. You might just make that sheet of paper having the figures an exhibit.
Mr. GUERNSEY: Have it copied into the record.
The MASTER: Yes, mark it as an exhibit and copy it.

The paper is marked Defendants' Exhibit 33, and is as follows:

3146 "DEFENDANTS' EXHIBIT 32.

Opening difference at January 1, 1895		$40,000.
Exclusive of amount paid to United Gas Improvement Company in settlement of open account at March 1, 1906		120,000.
Total bond discounts and organization expenses excluded 1906-1910		41,000.
		$201,000
1,928,016.65		
1,727,675.67		
200,340.98		
	295,383.08	
	13,393.52	
	30,588.09

120,000. bonds		
40,872.82 bond discount		
201,470.33		
200,340.98		
1,129.35 difference unexplained."		

Mr. BYERS: Now, Mr. Hall, resuming the examination where we left off last night, I believe we were at page 24. With respect to that $120,000 which you allowed for the holder there, did you have any conversation with any of the officers of the Company with respect to that holder?

A. Yes.

Q. And with whom was that conversation?

A. Mr. Curran, Comptroller of the United Gas Improvement Company.

3147 Q. What explanation did he give you?

Objected to on part of complainant as being incompetent, because it does not appear that Mr. Curran had any authority to represent the complainant or that he was an officer of the complainant or connected with it in any way.

A. I got no explanation beyond the statement that the holder was there and the records in Philadelphia.

Q. Now, in that connection, Mr. Hall, did you find anything among the books and papers of the Company that gave you any information with respect to the holder, or the cost of it?

A. Nothing at all.

Q. Or any direction to make any charge on the books with respect to it?

A. Nothing; no sir.

Q. Or any authorization for its construction?

A. I saw nothing at all, sir.

Q. Now the assets turned over as shown by the books of the Company you stated yesterday was $3,334,000 and were made up of what items?

A. 22,490 shares of capital stock, par value $2,249,000; first mortgage 5% bonds $285,000; preferred stock contracts $800,000; total $3,334,000.

Q. How were those assets or securities disposed of by the Capital City Gas Light Company?

A. May I answer further on the last question.

Q. Yes, sir.

A. The property handed over had a mortgage of $400,000 which was assumed by the Des Moines Company, making the total face value of the plant $3,734,000.

3148 The MASTER: Right there, was there interest accrued on the bonds at that time?

A. My recollection is no—yes sir, there was $4,000.

The MASTER: I mean on the Capital City bonds?

A. Yes, sir; $4,000. Answering your next question, the consideration received by the Capital City Company was in part paid, for the Valley Junction property $45,000 bonds out of the $285,000 being given to Mr. Haines and Mr. Keffer. $120,000 of the remaining $240,000 bonds was handed over to the United Gas Improvement Company in settlement of a debt of $105,526.49; the balance $3,169,000 made up of the remaining bonds, $120,000, preferred stock contracts $800,000 and the capital stock $2,249,000, was according to a general entry on the books of the Capital City Company disposed of as follows: Dividend in liquidation distributed pro rata to the stockholders of this company in the securities of the Des Moines Gas Company these 22,490 shares of capital stock; $120,000 first mortgage gold bonds, $800,000 preferred stock contracts, as authorized by the board of directors at a meeting held February 28, 1906, at three o'clock P. M.

Q. Now, at that time, or about that time, did you find anything in the books of either Company that would furnish us any better explanation of the holder and the other $120,000 than you have already given us?

A. No.

Q. Now, Mr. Hall, on the next page, you refer to an appreciation of $131,744.44 included in the plant account dated May 1st, 1897; I wish you would explain that?

A. The capital stock of the Capital City Company at that time amount- to $300,000. The accumulated profit- subseqient to
3149 1886 and up to that time were $168,255.51. To that amount there was added an appreciation of $131,744.44, to bring the balance of the credit or surplus account up to $300,000. A stock dividend was then declared of $300,000 to the stockholders.

Q. In other words, $131,744.44 was added to the assets, book assets, to cover the depreciation of the property during the period covered by the entry and added to the surplus profits to make the book entry balance with the $300,000 additional stock that was then issued?

A. Yes.

Q. And distributed to the stockholders as a stock dividend?

A. Yes.

Q. That then would bring the capital stock of the Capital City Gas Light Company on that day up to $600,000?

A. Yes, sir.

Q. Is that what the books show with respect to that matter?

A. Yes.

Q. Just as you stated?

A. Yes, sir.

Q. Now, yesterday you said something about depreciation that was charged off in 1909. I wish you would state now just what the books show with reference to that $264,108.78.

A. The $264,108.78 represented the accumulated profits after paying interest and dividends on preferred stock contracts from March 1, 1906, to June 30, 1909, and was transferred from the credit or profit and loss account, to the credit of the property and plant account as of the latter date, June 30, 1909.

Q. Do you have now before you a memoranda showing just the entries as they appear on the books?

A. Yes.

3150 Q. I wish you would read them into the record.

A. In Journal 2, page 244-A, an inserted page, there are two entries dealing with the matter.

Q. Under what date and between what date?

A. June 30, 1909. The first entry is charging accrued profits covering the period of March 1, 1909, to June 30, 1909, and crediting the profit and loss account with $29,656.72.

Mr. GUERNSEY: The witness was asked to state what the books show. The books don't show what you say; the word "charging" is not there, and it don't say accrued profits.

A. Yes, sir.

Mr. GUERNSEY: I have no objection to him stating it in his own way, but it ought not to appear that he is reading a copy from the book.

A. The explanation given to this entry is: "For accrued profits from March 1, 1909, to June 30, 1909," another entry follows that

charging the profit and loss account $264,108.78 and crediting the property and plant account $264,108.78. The explanation given is "to close balance of account."

Q. Now, did you find anything there among the books and papers of the Company explaining how that entry comes to be inserted in the books as of June 30th?

A. Yes.

Q. The entry was not made at that time, was it?

A. No, it was made under instructions by the Philadelphia office under date of December 2, 1909.

Q. Did you read those instructions?

A. Yes, sir.

Q. State them.

A. Quoting from the letter addressed to Mr. Jansen Haines
3151 and signed by E. L. Brundrett, and headed, "Re-Journal entries", the letter reads: "I enclose herewith Journal entries which should be spread on your books under date of June 30, 1909. If there is no blank space in your Journal in which you can enter these entries you can please insert a page which I am sending you in the proper place and post to your Ledger under date of June 30, interlining if necessary to get the posting under that date." Those are the two paragraphs.

Q. What is the date of the letter?

A. December 2, 1909.

Q. So that from your examination of the books, what do you have to say as to whether the page that you found there in the books was made up here or in Philadelphia?

A. It appears to be made up in Philadelphia; it was an inserted page.

Q. Now yesterday, while we were dealing with this same item, $264,108.78, the Master asked you something about the salaries account and you gave some testimony with respect to that. I wish you would cover that again.

A. In regard to the Philadelphia salaries?

Q. Yes, if there is any correction you want to make.

A. I find the salary checks and vouchers are made out in the treasurer's office in Philadelphia and sent here for signature, and after signature returned to Philadelphia and endorsed by the officials there and the money collected. The vouchers are all retained in Philadelphia. The checks are not made out here but a Journal entry is made on the books charging the salaries and crediting the treasurer's account.

Q. So the whole matter is a matter of book entries so far as the books here are concerned?

3152 A. Altogether, yes.

The MASTER: That is different from what you stated yesterday.

A. I made the statement yesterday that the officials here made out the checks, but they are made out in Philadelphia.

Q. Now, there was something said yesterday about the federal tax. Have you made some investigation of that since yesterday?

A. Yes.

Q. I wish you would state into the record just what the books show with respect to the federal tax and how the account would figure out.

A. The books show in 1911 a federal tax covering the fiscal year 1910 was paid on $128,737.13; at 1% that tax is $1,287.37.

Q. You found the item of $1,287.37 in the books, did you?

A. Yes, sir; in 1911.

The MASTER: What was that paid on?

A. $128,737.13.

The MASTER: That was the net?

A. The net earnings.

Q. You made out a statement showing how that figures out from the books?

A. I took their own statement and endeavored to figure it out.

Q. State it into the record as you figured it out.

A. The income account prepared by the Company shows that after charging all interest and dividends on preferred stock contracts, a balance of $106,406.36. To get at the taxable income you have got to *right* back dividends paid on preferred stock contracts, amounting to $27,330.77, leaving a net income for charging dividends of $133,737.13. The government provides a statutory allowance of $5,000 which I have deducted, leaving a net balance of $128,737.13.

3153 Q. So that the charge on the books of $1,287.37 tests out with their book entry as to the net income, after charging interest and dividends on preferred stock contracts?

A. After charging interest on bonded and floating indebtedness, but before charging indebtedness, it checks out.

Q. Now, did you cover 1910 in the same way?

A. That is 1910.

Q. I mean 1909?

A. Yes, I endeavored to check out 1909. I couldn't do so exactly on account of the broken period reported in ten months, to December 31, 1909.

Q. Now, the 1909 federal tax, as you have it figured out, as near as you can get at it, how does it test out?

A. The actual tax paid was on the sum of $144,760.85. At 1% that is $1,447.61. I might explain, that was paid under protest. As near as I can figure their earnings that year were $134,599.94, equivalent to a tax of $1,346. I had to accept as a basis a ten month period to December 31, 1909, and add back one-fifth of that. The difference is explained in the January and February months, being more than one-fifth.

Q. The way you figured it out, using ten months as the basis, the net income over and above the $5,000 exemption, would be $139,599.94?

A. Yes.

Q. And the net income upon which the taxes were figured, as you did, on the basis of the ten months, was $134,599.94, instead of $144,760.87, on which they actually paid taxes?

A. Yes.

The MASTER: Why do you add one-fifth there?

A. The period reported was ten month- and we added one-
3154 fifth to bring up the calendar year.

The MASTER: You could not ascertain that amount?

A. I might if I spent some time on it. I have no doubt if the two months were checked out against the ten, it would run out very closely.

Q. Now, Mr. Hall, you were to get me a statement of the extra expense we were talking about yesterday in the way of donations and subscriptions. Did you get that for me?

A. Yes.

Q. I wish you would state into the record just what the books show with reference to these matters, the items and amounts and the dates.

A. For the period of ten months before December 31, 1910, the extra expense amounted to $3,392.36 and covered subscriptions to the Commercial Club, $265.; to the Y. M. C. A. $100. Material supplied to the Y. M. C. A. $205.25; subscription to the Methodist Hospital $100; to the Greater Des Moines Committee $1,500; to the Coliseum Company, capital stock, $500; to Mr. Haines for Christmas gifts to the staff $655; and for sundries including Mr. Haines' extra expenses $67.11. Total $3,392.36. I would like to explain that yesterday I stated that the Christmas gift went to Mr. Haines; that was a mistake; it should be to the staff; he acted as an intermediary.

For the year ending December 1910 the Commercial Club subscription was $200; the Y. M. C. A. $100; Methodist Hospital $100; Greater Des Moines Committee $2,225; Mercy Hospital $400; Christmas gifts to the staff $711; Roadside Settlement $50; sundries $178.78. Total $3,964.78.

Q. There was no other explanation to the item of sundries?

A. It included Mr. Haines' extra expenses.

3155 Q. Now, this $264,108.78 in that letter that was sent here with the entries that the local managers were directed to place in the books, was there anything in these books here from which you could check up without much trouble the accuracy of the items of credit charged that was in that letter?

A. The method of making up the amount is not clear.

Q. In order to get the final word with respect to these charges where would it be necessary to look for them?

A. At Philadelphia.

Q. In the books of the Philadelphia office?

A. Well, I don't know; the books or the author of the letter would probably know.

Q. There is nothing here to indicate it?

A. There is nothing here to indicate the reasoning in making it up at all.

The MASTER: In your calculations were these items here rejected?

A. No, sir; I included those as expense.

The MASTER: You also included the federal tax?

A. Yes.

Q. I wish you would explain the working capital item in your statement as you have already put it into the record, just how you arrived at the amount of $68,952.91.

A. In arriving at the amount of working capital, we first determine the amount of actual capital involved for all purposes, including the fixed property and work from that. The result is that the deduction of all current and accrued liabilities would bring out a net balance available for working capital.

Q. Is that the proper method?

A. Well I don't know that there is any proper method.

3156 To my knowledge, there has no definition ever been made of working capital or any method by which you can get at it.

Q. Now state how you arrived at the item $68,952.91.

A. I took all the current assets, including account- receivable, inventories, cash on hand, and from that deducted the outstanding liabilities, notes payable——

Q. State the figures as you work it out.

A. The current working assets made up of materials and supplies $77,410.46; accounts receivable $51,858.54; cash in bank and in hand $49,434.15; insurance paid in advance $905.20; or the total working assets $179,608.35. From that figure deduct the bills and accounts payable amounting to $51,838.37, and the accrued taxes and interest $58,817.07, a total deduction of $110,655.44, leaving a balance of net current assets of $68,952.91.

Q. Which you designate as the working capital?

A. Yes; that is the actual amount in the business over and above what they have invested in their plant property.

Q. Well, what do you have to say whether or not that would be a reasonable amount for this concern?

A. It seems to me to be about reasonable.

Q. Would you allow any more?

A. That seems to be ample, looking at the balance sheet.

Q. Do you make that statement having in view what you have observed with respect to the business as shown by the books in the past?

A. Yes, and generally my knowledge of the requirements of all business for working capital.

Q. In these deductions why did you deduct the bills and accounts payable?

A. The bills is an honor demand note and will be met out

3157 of the funds on hand.

Q. I notice quite a little difference between the amount you allowed as working capital and the amount Mr. Hagenah allowed?

A. I think the difference is explained. I have deducted the accrued interest and he has not. If you take this balance sheet and take the date after the payment of taxes and interest, you will find the cash is correspondingly reduced and no liability appears.

Q. You have also taken out the bills and accounts payable?

A. Yes, sir; those are proper deductions.

Q. The accounts payable were not deducted by Mr. Hagenah and that with the accrued interest would account for the difference?

A. Yes. I will say this, these long time bills issued for construc-

tion purposes there would be a justification for excluding them; you cannot lay down any hard and fast rule on it.

Q. The method you adopted here and the amount you allow for working capital in this particular case, you say is reasonable, and all they ought to be allowed?

A. It seems to me quite reasonable, yes.

Q. Now this balance sheet on page 27, I wish you would make whatever explanation with respect to that you want to make and state it in the record.

A. This balance sheet differs from the books of December 31, 1910, to the extent, we reverse for this purpose the entry of depreciation or charge off made June 30, 1909. The fixed assets are $4,118,084, representing the cost to the Des Moines Company of these properties.

Q. In securities?

A. In securities. The current and working assets are $178,703.15. The charges deferred to future operations representing in-
3158 surance paid in advance amount to $905.20. Total assets $4,297,692.35. That is represented by capital stock $2,250,000. Preferred stock contract $411,000, and first mortgage gold bond $1,097,000, giving a total fixed liabilities $3,758,000. Current liabilities are $51,838.37. The accrued liabilities are $58,817.07; and the surplus before charging off what I term depreciation is $429,036.91. The total being $4,297,692.35. The balance sheet at March 1, 1906, has fixed assets of $3,592,723.24, or $525,360.66 less than December 31, 1910. The capital working assets March 1, 1906, amount to $179,527.03, or $823.88 more than December 31, 1910. The charges deferred to future operations March 1, 1906, amount to $993.38 or $88.18 more than December 31, 1910. Total assets March 1, 1906, are $3,773,243.65 or $524,448.70 less than December 31, 1910. The capital stock March 1, 1906, amounted to $2,249,000 or $1,000 less than December 31, 1910. The preferred stock contracts amounted to $800,000 or $389,000 more than December 31, 1910.

Q. Which means that the difference between $389,000 and the $800,000 are still outstanding?

A. Yes, sir.

Q. The others have been taken up?

A. Yes. The first mortgage gold bonds outstanding March 1, 1906, amounted to $685,000 consisting of $400,000 Capital City bonds $285,000 Des Moines Company bonds. These bonds are $412,000 less than December 31, 1910. The current liabilities March 1, 1906, were $18,227.80 or $33,610.57 less than 1910. The accrued liabilities amounted to $21,015.85 or $37,801.22 less than December 1910. There was no surplus account March 1, 1906. The total liabilities at that time were $3,773,243.65.

3159 Q. Now in your capital account, the items that make up $77,410.46 include what particular property?

A. They are represented by stock of tar, gas, fuel, oil, etc.

Q. And a table of that is shown on pages 27 and 28 of Exhibit 30?

A. Yes.

Q. The surplus account showing the credit balance $429,036.91. What does that represent?

A. That represents an adjustment of the surplus accounts shown by the books of the company, and with the statement submitted by me now shows a credit balance on the company's books of $420,036.91.

Q. What relation if any does it have to the accumulated income?

A. That is the accumulated income.

Q. For what period?

A. From March 1, 1906, to December 31, 1910.

Q. For a period of four years and ten months?

A. Yes, sir.

Q. Is that before or after deducting interest?

A. After deducting interest and dividends on preferred stock contracts.

Q. In other words, that is the net surplus accumulated income for that period?

A. Yes.

Q. And is made up of what items?

A. The net income for the year February 28, 1907, $49,454.76. For the year February 29, 1908, the net income is $77,739.26. For the year February 28, 1909, $107,017.04. For the ten months to December 31, 1909, $87,305.06. For the year ending December 31, 1910, $112,168.60. Being a total income of $433,684.72.

3160 Deduct from that the tax omitted by the Company, charged by us, $1,287.37.

Q. That is the federal tax?

A. Yes, for 1910.

Q. I wish you would explain the net income a little further.

A. The net income of the Company was ascertained after charging interest on the bonded debt and dividends on preferred stock contract, but before making any charge covering depreciation of the property.

The MASTER: That is from the time the Des Moines Company took it?

A. Yes.

The MASTER: $429,036.91?

A. Yes.

The MASTER: That is the total net income during that entire period?

A. Yes, sir; subject to the fact that no depreciation was taken out.

Q. Now, how does the bond account, preferred stock account compare with your ascertained cost of physical property?

A. At March 1, 1906?

Q. Yes, and now, December 31, 1910?

A. Taking March 1, 1906, we first find the book value of the Capital City plant February 28, 1906, $1,565,230.09. Deduct the appreciation of 1897, $131,000, and the assets omitted from the appraisal of 1895, $211,000, and we have a deduction of $345,765.60 which leaves a net book value of $1,219,464.49. Add to that the

estimated cost of the gas holder, $120,000, and the Valley Junction properties, $45,000, would give an actual cost February 28, 1906, of $1,384,464.49. That was represented by Capital City Company bonds $400,000, from which I have deducted the water gas
3161 set abandoned, $211,468.16, leaving net $188,531.84. Add Des Moines Company bonds paid for the gas holder and Valley Junction properties $120,000. Add liability to the United Gas Improvement Company paid by the issue of $120,000, $105,526.49. Add surplus earnings from 1886 to 1906, $627,959.16. Add capital stock issued in 1886, $300,000. Deduct the small charge of electric company stock charged to plant and now eliminated $2,553, and we have the same result $1,384,464.49. This appears to have been taken over for the original Capital City Company bonds, $400,000, and the Des Moines Company bonds $165,000, and the additional Des Moines Company bonds $120,000 and the total issue of $285,000 issued at the time of the reorganization, and the preferred stock contracts $800,000, the total being $1,485,000 excluding altogether capital stock.

The MASTER: The interest added to that would make it $1,489,000?

A. Yes, the interest is all taken into account. That makes a par value for these securities of $100,535.51 in excess of what would appear to have been the value of the plant.

Q. In other words, that would indicate that the total cost of the plant had been paid for out of these securities?

A. Yes.

Q. Now as to December 31, 1910, what does it show?

A. In regard to December 31, 1910, the plant was increased by $525,360.76, the additions to the plant account appearing in the balance sheet for the period to December 31, 1910, amounted to $525,360.76. Of that amount $484,487.94 represented actual additions to the physical property; $40,872.82 discount on bonds and similar charges. Against the $484,487.94 the Company has issued further bonds amounting to $412,000.

3162 The MASTER: Where do you find that?

A. Partly on page 21 and partly on page 27; the balance sheet is on page 27.

Q. I have not followed you with the figures, but in a general way, if I understand you, the actual additions to the plant since 1906 up to December 31, 1910, amount in round numbers to about $70,000 more than the bonds issued and sold during that time?

A. Yes, sir.

Q. Do the figures you give represent the face of the bonds or the amount received for the bonds?

A. The face of the bonds.

Q. Was the difference as much as $70,000, was there any change in the value of those securities during that time?

A. I am sorry, I don't understand the question.

Q. I don't know whether I do. How much of a reduction was there in the preferred stock contracts during that period?

A. $389,000.

Q. How do the books indicate that difference was accounted for or taken care of?

A. Partly made out of the surplus earnings.

Q. Or profit?

A. In part.

Q. Is there anything on the books here in Des Moines that indicates any actual money was put into this property during those years other than the earnings and the receipts from bond issues and bond sales?

A. That is all.

Q. Now on the bottom of page 28 and continuing to page 29 you have worked out an annual estimate, and I wish you would explain that to the Master as fully as it needs to be?

3163 A. That statement is one of the estimated investment in the plant commencing with the appraisal of 1895, and adding an allowance in that year and in all subsequent years of $50,000 for working capital and adding the additions made during each year. The third column states the per cent that revenue bears to the investment. The fourth column shows the total revenue on the Company's books. The fifth and last column covers the operating expenses, together with an allowance for depreciation.

Q. And what is your average net result of that method?

A. The average result of the average investment shows a return of 9.56 per cent.

Q. Just take one of those years and work through it, if you please, take December 31, 1895, and explain how you work in your $50,000.

A. The investment on December 31, 1895 is made up of the appraisal of Col. Pratt, amounting to $429,426. To that I add $50,000 covering working capital, and the additions amounting to between $4,000 and $5,000, made during the year 1895, the total bringing out an investment, less depreciation for that year, of $484,664. After taking out six cents for depreciation the net revenue for that year was $36,351.

The MASTER: Six cents on every thousand cubic feet of gas?

A. Yes.

Q. The amount is covered by the preceding page?

A. Yes. $36,351, is the net revenue after taking out in addition to all the Company took out six cents for every thousand cubic feet of gas sold.

Q. In the next column, 7.50, that shows the per cent of return on the amount as you worked it out with your $50,000 capital added?

3164 A. Yes.

Q. Upon the actual operations as shown by the books of the Company for that year or period?

A. Yes.

Q. The only change and the only adjustment you made was to add $50,000 for working capital and deduct from the net revenue your six cents per thousand cubic feet of gas sold for depreciation?

A. Also deducted from the investment the amount of depreciation

added to the expenses. In other words, where I charge operations with an allowance for depreciation, a corresponding credit was made on the investment.

Q. That is proper, is it?

A. Entirely.

Q. You added, I believe, some additions, $2,000 or something like that?

A. In all cases I added the additions, whatever they were.

Q. Why did you allow for that year $50,000 capital; what was your idea about that?

A. $50,000 is simply an arbitrary allowance throughout the table.

Q. Was it your judgment that was a reasonable allowance for that time?

A. I know that was a good liberal figure.

Q. And this table was worked out through all the rest of the years in the same way?

A. Yes.

Q. And represents the books, except that you have added this $50,000 and allowed a depreciation of six cents per thousand cubic feet for gas?

A. Yes; in the last year, the entry carried a working capital, as already shown, of $68,000.

3165 Q. That you added for the last year?

A. Yes.

Q. With that added for the last year, it gave you a return, if I understand your table, on the total investment for the year 1910, figured out under this method, of a little over ten per cent.

A. 10.33 per cent.

Q. Now if you had accepted the Company's books, the figures just as they appear upon the records and without any depreciation entered as I understand you, would the rate of return have been higher than your figures?

A. Yes.

Q. How much?

A. 11.12 per cent or .79 per cent higher than I gave it.

Q. Which would make 11.12 per cent?

A. Yes.

Q. Turning to page 30, now Mr. Hall, did you ascertain from the books of the Capital City Gas Company or from any other record just when the United Gas Improvement Company acquired control of the Capital City Company?

A. July 1, 1886.

Q. How long did it operate the company under the name of the Capital City Gas Company?

A. Until February 28, 1906.

Q. I wish you would state into the record what the books of the Capital City Gas Light Company for the period from July 1, 1886 to July 1906 show with reference to the net income or surplus available for stockholders after payment of all interest charges?

A. For the entire period from July 1, 1886, to February 28, 1906,

the net income after payment of all interest charges appears
3166 to be $640,709.16. That amount is divisible between the periods from July 1, 1886, to December 31, 1896, and which earned $181,005.56. The period from January 1897 to February 28 1906 during which period they earned $459,703.60.

Q. How was this surplus disposed of?

A. The first surplus $181,005.56 was disposed of in part by payment of dividend April 30, 1888, of 4¼ per cent, equivalent to $12,750. That left a net undivided income of $168,255.56, which was in part applied in payment of stock dividends.

Q. Now that $300,000 the increase of the stock of the Capital City Gas Light Company was made about January 1, 1897?

A. Yes.

Q. And at that time the United Gas Improvement Company was the owner of the stock of the Capital City Gas Light Company?

A. As I understad it, yes.

Q. And this surplus, or the accumulated profits from January 1, 1897 to February 28, 1906, what did that amount to?

A. $459,703.60.

Q. At the time just prior to the transfer, how did that item appear, if at all on the books of the Company?

A. Appeared as a credit or surplus of the profit and loss account.

Q. Now you summarized that income before charging the depreciation on page 31. I wish you would explain that, if it needs any explanation?

A. The surplus income for the period of July 1, 1886, to December 31, 1896, amounted to $181,005.56. For the period of January 1, 1897, to February 28, 1906, it amounted to $459,703.60. For the period from March 1, 1906, to December 31, 1910, it amounted to $433,684.72. The total was $1,074,393.88.

Q. I understand that figure to represent the income of the
3167 Company the net income of the company, from July 1, 1886, to December 31, 1910, after meeting all interest charges, but without any depreciation?

A. Yes, sir.

Q. Is that correct?

A. Yes, sir.

Q. Now, as to accident claims, if any, did you consider them and how did you consider them as affecting the situation of this property as you tried to cover it in your investigation?

A. I am advised at the present time there are several accident claims outstanding against the company subject to litigation. No figure has been placed on them.

Q. You set them out on page 31 of your report?

A. Yes.

Q. Following page 32 of your report, I find inserted a sheet; I wish you would explain what that is?

A. That is a chart of the profits as shown on page 29 of this report.

Q. Explain to the Master the method of preparing the sheet and what may be ascertained from it?

A. This statement shows the period from 1895 to 1910. On the left hand column the amounts may be taken to represent the sales of gas in thousand cubic feet or dollars. On the right hand column is shown the percentage of the net revenue of investment as set forth on the page. This table shows an estimated investment less depreciation and shows the revenue from the sale of gas stated in dollars and thousand cubic feet, including an allowance of six cents for depreciation, while the dotted line represents the percentage of the net revenue to the investment.

Q. Now take that sheet, and the first line from the bottom,
3168 beginning opposite the figures 50,000 in the left hand column and running up into the right side of the sheet to the figures 3.7, what does that represent?

A. That represents the operating expenses including allowance for depreciation.

Mr. GUERNSEY: That is operating expenses in what?

A. The operating expenses including all interest——

Mr. GUERNSEY: But designated in what day?

A. By dollars.

Q. The 50,000 represents the dollars?

A. Or cubic feet as the case may be. In this particular line, the operating expenses of this is the year 1895 and appear to be about $57,000; while in the last year they would run up to $378,000 about.

Q. And the second line, beginning opposite 60,000 and running up to opposite the figures 5.3 on the right hand side, what does that represent?

A. That represents the gas sales in thousand cubic feet. The first year that appeared to have been 61 million feet, while in the last year they run up to 531 or 532 million feet.

Q. And the short line beginning opposite the figures 90,000?

A. That represents the revenues stated on a basis of dollars.

Q. What if any significance is there in the apparent widening of the space between those first two lines as you go up?

A. Considerable dumping in of expense in the year- 1909 and 1910, especially 1910, the ratio of the sales appears to have been narrowed down.

Q. The years are shown across the bottom of the sheet?

A. Yes.

Q. What significance, if any, is there in the apparent
3169 widening of the space between the first and third lines?

A. The widening would indicate there is a larger profit to be added, and where they pull together it is smaller.

Q. Now, Exhibit A, attached to your report, explain briefly what that is and what it shows.

A. It is an income and profit and loss account covering the period from January 1, 1906, to December 31, 1910.

Q. The first six columns show the revenue for the several periods covered by the sheet; the last two columns, the second from the end shows the total for four years up to December 31, 1909; and the last column the total for the five years which would include ending December 31, 1910?

A. Yes, sir.

Q. And is merely a detailed statement or summary of the figures that you cover in your report as we have gone over it?

A. Yes.

Q. Now I wish you would state briefly what Exhibit B is and make such explanations as are necessary to make it clear.

A. Exhibit B is an income profit and loss account covering the period of January 1, 1906, to December 31, 1910, stated in cents per thousand cubic feet sold; it is a summary on that basis of Exhibit A.

Q. That is a similar table to the one covered by Exhibit A, except this is worked out in cents per thousand cubic feet?

A. Yes.

Q. Exhibit A is continued on the second page and covers interest on floating debt and interest on bonds and preferred stock, etc.

A. The exhibit has two pages; Exhibit B carries the same summary on one page.

Q. And Exhibit C, I wish you would state what that is and
3170 make such explanation as you care to?

A. It is a statement of the total gross revenue received from the sale of gas for the five years ended December 31, 1910, stated in both cubic feet and dollars and cents.

Q. And Exhibit D?

A. Is a comparative statement of the cost of manufacturing and distributing gas for the five years ending December 31, 1910.

Q. I wish you would go through that briefly and give us that comparison in figures—the totals.

A. Do you wish the total distribution or grand total?

Q. The grand total.

A. The total expense the two months ending February 28, 1906, is $39,650.85. For the year ended February 28, 1907, the expenses were $252,391.29. For the year ended February 28, 1908, the total is $280,579.21. For the year ended February 28, 1909, the total is $278,530.68. For the ten month- ended December 31, 1909, the expenses were $254,495.83. For the year to December 31, 1910, the expenses were $347,222.39. The total expenses for the four years to December 31, 1909, were $1,105,647.86; or for the five years to December 31, 1910, the expenses were, $1,452,870.25.

Q. Now take Exhibit E.

A. Is a summary of Exhibit D stated in cents per thousand cubic feet for the same period, five years.

Q. That is true as to both sheets of Exhibit E?

A. Yes, covering the period.

Q. Take Exhibit F?

A. Is a comparative balance sheet from the compilation of the Des Moines Company from March 1, 1896.

Q. Schedule No. 1 attached to your report, what is that?

3171 A. A statement of the quantity of gas manufactured, sold and used by the Company and unaccounted for for five years up to December 31, 1910.

Q. Where did you get your basis for this schedule?

A. The books of the Company.
Q. Schedule 2, explain that?
A. That is a comparative monthly statement of the quantity of gas accounted for and unaccounted for for the five years.
Q. Where did you get the basis for that schedule?
A. The books of the Company.
Q. No adjustments or additions?
A. No.
Q. Schedule 3?
A. Is a summary of the extensions and improvements to the works and plant from January 1, 1895, to December 31, 1910.
Q. What period does it cover?
A. January 1, 1895, to December 31, 1910; there are two sections of the schedule.
Q. The two sections cover that period?
A. Yes.
Q. Where did you get the basis for this figure?
A. The books of the Company.
Q. Does this represent the actual extensions made as shown by the books during these periods?
A. Yes.
Q. Extensions and improvements?
A. Yes.
The MASTER: That shows the character of the improvements?
A. The character of the improvements at the works.
The MASTER: Over what years?
3172 A. From 1895 to 1910.
Mr. BYERS: It covers two periods, your honor.
The MASTER: 1906 is the time of the Des Moines Gas Company?
A. Yes, this last section covers that period.
Q. And schedule 4, what is shown by that schedule?
A. Certain general statistics in regard to population, meters and services in use, etc.
Q. Is that schedule made up from the books of the Company?
A. Yes, it covers the period from 1895 to 1910.
Q. Schedule 5?
A. Is a summary of the additions to mains, services, meters, street lamps from January 1, 1895, to December 31, 1910.
Q. Where did you get those figures?
A. The books of the company.
Q. Here in Des Moines?
A. Yes.
Q. No adjustments or additions and charges by you?
A. None at all.
Q. Schedule 5 covers several sheets?
A. It covers three sheets.
Q. Schedule 6, what is shown by that?
A. Information in regard to standard prices paid by the Company for fuel, wrought iron pipe, cast iron pipe, etc.
Q. Where did you get the figures for this schedule?

A. From the vouchers of the Company.

Q. Schedule 7, what does that show?

A. A list of the offices salaries and particulars of the pay roll of December 24, 1910, as regards the office, and December 15, 1910, as regards the works.

Q. Where did you get the basis for the table?

3173 A. The books of the Company.

The MASTER: I call your attention to schedule 6, the prices there given are from the books?

A. Yes, sir; from the books and vouchers. The date of the invoice is stated on one side.

The MASTER: That is the price paid for the material?

A. Yes, sir.

Q. Now, Exhibit 30, Mr. Hall, has been referred to during your examination as made up by you, if I understand you correctly and is a complete memoranda made up from your examination and investigation of the books and contents and the facts that you have been giving upon the witness stand here, as you found them from the books, with such extensions or your tables and schedule and figures as seemed to you necessary to make the memoranda clear and intelligible, is that right?

A. Yes, sir.

Q. And you have stated in your examination just what changes or additions or adjustments you have made in the accounts of the company as you found them upon their books?

A. Yes, sir.

Q. And those adjustments and changes, as the case may be, are fully covered in this memoranda or report, Exhibit 30, by proper explanations?

A. Yes, sir.

Q. Is that right?

A. Yes, sir.

Q. How did you find in your examination that the books of this Des Moines Gas Company are kept?

A. They appear to be pretty well kept.

Q. I did not mean in that respect?

3174 A. In what respect?

Q. Take the book keeper, for instance, where did he get his memoranda or data or facts and figures to go upon the books of the company here?

A. They appear to come very largely from Philadelphia.

Q. Did you find anything here from which you could ascertain to your satisfaction the question of contracts for materials and supplies and so on?

A. Yes, we received a copy of the contract purporting to be made by the purchasing agent with the various contractors.

Q. That is to say, you found here among the records copies of contracts that the purchasing agent sent here with respect to contracts he had made for materials and supplies for this office?

A. Yes.

Q. Now was there any way you could ascertain here whether the contracts made—who were those contracts usually made by?

A. By Mr. Pearson, I think, the purchasing agent.

Q. Was there any memoranda here or any books or any records from which you could tell just the basis of those contracts other than what appeared on those copies that were sent here?

A. No, simply what the copies show, was all we had.

Q. You examined the contracts?

A. Yes.

Q. What do you have to say with reference to the price paid for oil as shown by the contracts?

A. The price paid was 2.8 per gallon as shown by the contract.

Q. Was there anything about that price that seemed to be out of the usual and ordinary?

3175 A. I must say I thought it would be some lower.

Q. You thought it ought to be lower?

A. I understood there was a very considerable cut of the price of oil two or three years ago. I thought the price was somewhat high, speaking from recollection.

Q. Did you try to ascertain whether the United Gas Improvement Company had anything to do with those contracts or prices of this oil?

A. All I know, Mr. Pearson, the purchasing agent is identified in some way with the United Gas Improvement Company.

Q. If you as an expert accountant were going to make up a complete and accurate statement of the actual cost of the property of this Des Moines Gas Plant here for the purpose of furnishing a report to your client that would be complete in all its details and would show exactly all materials and all machinery furnished by the U. G. I. to this Company here, could you do it and would you be satisfied to do it from these books alone?

A. No, I would want to see the books of the United Gas Improvement Company.

Q. Especially upon what matters?

A. The question of bonds, the settlement for these bonds; I might want to know something more about these contracts.

Q. To ascertain those facts it would be necessary to have recourse to the books of the United Gas Improvement Company?

A. It would, yes.

Q. And about those salaries?

A. I understand the salaries are absorbed by the United Gas Improvement Company—that is my understanding.

Q. Do the books here show anything about the purchase of these bonds?

3176 A. No, except that the transactions are arranged by the treasurer from his office in Philadelphia.

Q. The people in Philadelphia simply direct the manager here what to put on his books with respect to the bonds?

A. Yes.

The MASTER: Is that done by the directors of the Company or done by the United Gas Improvement Company?

A. It is done by the directors of the Company.

The MASTER: Which Company?

A. This company?

Q. The Des Moines Company?

A. Yes, the treasurer of the Des Moines Company sends the entries through to Philadelphia.

Q. The direction is from an officer of this company who is in Philadelphia and is also one of the officers of the United Gas Improvement Company?

A. I understand he is.

Q. Now is there anything here to show the rate of discount, if any, of the bond sales?

A. There are several bond sales entered at a discount of ten per cent and two sales at five per cent.

Q. When were those two sales entered?

A. The two showing the discount of five per cent in the year 1909 and 1910.

Q. Who got these bonds?

A. There is no record in the books her- to show who bought the bonds. The transaction was made by the treasurer; the final disposition of the bonds is not shown.

The MASTER: The treasurer of the United Gas Improvement Company is also the treasurer of this Company?

3177 A. Yes, he has some position with the United Gas Improvement Company; I don't know what.

Mr. BYERS: I think Mr. Douthirt stated he was also treasurer of the United Gas Improvement Company; Mr. Lillie is the treasurer.

Q. The bond sales which you say the books show a discount of ten per cent, when were they made?

A. In the earlier years, 1906 and 1907.

Q. Do you know who got those bonds?

A. No.

Q. Is there any way to tell from the books here?

A. No; they went down through the treasurer's office, and this office was advised of the sale.

Q. From the Philadelphia end?

A. From the Philadelphia end.

Q. And advise- as to the amount received for the sale?

A. Yes.

Q. And the credit that should be entered on the books?

A. Yes.

Q. Did you have access to the bank-books of the Company here?

A. We did not consider those necessary at all.

Q. Did you make any inquiry about them?

A. No.

Q. Now, Mr. Hall, I wish you would work out for me, take the last year of this Gas Company, the year ending December 31, 1910, and eliminate for us all charges which you think ought to be eliminated and state to the Master just what was the actual cost of manufacturing gas and delivering it to the consumer in the city of Des

Moines for that year, as shown by the books of the Company,
3178 with such elimination as you think ought to be taken out?

A. Eliminating the items about which there may be a reasonable doubt in regard to a proper charge—I refer particularly to the new furniture purchases and expenses extra and salaries general—there is a justification for taking out the new furniture. The extra expenses—there has been a ruling made in regard to those charges under the traction ordinance in the city of Chicago. The Company and the City have a partnership agreement. The City won't permit the Company to charge anything in the way of charity subscriptions, no charges of that nature at all. Accepting the city comptroller's ruling and also eliminating salaries general, we would have adjusted, the revenue for the year 1910 on the basis of 90 cent gas and on the basis of actual distribution expense for that year, $119,698.40, equivalent to 22½ cents per thousand cubic feet sold. That on the investment of $1,550,000, is equivalent to a return of 7.72 per cent. If we go further and accept Mr. Hagenah's elimination of $7,351.92, referred to on page 30 of his report, we would have an adjusted return of 23.88 per thousand feet, which is equivalent to 8.19 per cent on their investment.

Q. That is at 90 cent gas?

A. Yes.

Q. That does not quite answer my question.

A. Applying the same adjustments on the amounts, taking the actual manufacturing expenses for 1910 and the average operating and distribution expenses for four years to 1909, applying them on the 1910 income we would have an adjusted revenue for the year 1910 of 27.88, which is equivalent to 9.56 per cent on the investment. Applying the next table on the basis of the actual
3179 manufacturing expenses for the year 1910 and the distribution expenses based on an average of five years to 1910, including depreciation, and accepting 90 cent gas, we would have an adjusted revenue of 26.63, or 9.13 per cent upon the investment.

Q. What I wanted Mr. Hall, before we got to this, was for you to take the gross revenue of the Company for the year ending December 31, 1910, and after deducting all the different operating expenses I wanted you to state the actual cost without respect to the rate of manufacture and delivery to the consumer per thousand feet of gas in Des Moines for that year?

A. Applying these adjustments?

Q. Yes. First let me ask you about the item of furniture, was that all covered in the year 1910?

A. Yes.

Q. And the entire charge for the furniture was carried into the operating expenses for that year?

A. Yes.

Q. Is that in your judgment a proper way to charge it?

A. No, it should be charged to the furniture account; some people do charge it that way.

Q. If it was charged to operating expenses, should it all go into one year?

A. No, it should go over about ten years.

Q. Without reference to that now, eliminating such items as you think ought to be eliminated and using the actual operations of the Company as shown by their books, what was the actual cost to them for delivering to the consumer a thousand feet of gas in Des Moines for the year 1910?

A. Accepting the eliminations of furniture, extra expenses and salaries general, the total cost would be 62.4 per thousand
3180 during the year 1910.

Q. Now, if you would take the average for the preceding four years for distribution in general, what would be the cost then?

A. Under the basis of actual manufacture for 1910 and the average operating for four years from 1906 to 1910, the cost would be 56.2 per thousand.

Q. Let me see if I understand that. If 1910 had been a normal year as compared with the four preceding years, normal in distribution in general, the actual cost for manufacturing and delivering a thousand feet of gas to the consumers in Des Moines for that year would have been 56.2 cents.

A. No, I wish to correct myself. Under the basis you speak of it would be 62.82 including an allowance for depreciation. My previous answer I would like to correct to the extent of saying that the cost for the year 1910 on actual expenses subject to adjustments, including allowance for depreciation, would be 68.2 per thousand.

Q. I am not as clear now as I was before. I am not talking about depreciation at all; there was no depreciation. I want you to take the Company's books just as they were and handling the matter leaving out depreciation?

A. Then my original answer was correct; 62.4 per thousand for 1910.

Q. If you used the average for the preceding four years, what would it be?

A. 57.02 cents per thousand.

Q. In other words, if I understand you now, if in the year 1910, if the expense of operation as charged by the Company and the expense of distribution had been the same as the average of the preceding four years, the actual cost of manufacturing and
3181 delivering a thousand feet of gas to the consumer in Des Moines would have been a fraction over 57 cents?

A. Yes, sir.

Q. And to that, if you were figuring out the cost, having in mind a reasonable allowance for depreciation, you would add six cents per thousand feet for depreciation?

A. Yes.

Q. What has been done with the surplus profits of this company?

A. Been retained in the business.

Q. Used for any other purpose?

A. They have been applied in repaying preferred stock contracts.

Q. The preferred stock contract account, is that full and complete on the books here?

A. It appears to be.

Q. How is it made up, by instructions from Philadelphia?

A. Yes.

Q. Have any of those bond sales so far as the books show been used to take up preferred stock contracts?

A. At least two of the sales of bonds appear to be made on the same day as the preferred stock contracts were retired.

Q. Were the book entries sent here sufficiently full and complete so that you could tell whether the money was used to take up preferred stock contracts?

A. You couldn't tell what they did with the money; it simply went into the pot.

Q. You couldn't tell whether it was used to take up preferred stock contracts or not?

A. I could not say; but on March 31st, 1909, and October 31st, 1909, they sold bonds and retired preferred stock contracts
3182 the same day.

Q. How much did the bond sales amount to?

A. In total, $92,000.

Q. What was the total preferred stock contracts taken up?

A. $217,910.80.

Q. On the same day?

A. On the same days—two days.

Q. This bond sale, how was it entered on the books up here?

A. The entry is a straight bond sale, the proceeds being charged to the treasury.

Q. Just simply charged to the treasury?

A. Yes.

Q. To ascertain exactly what was done with that, you would have to have the books in Philadelphia?

A. Yes.

Q. And exactly what was done with the money?

A. Yes. The proceeds of the bonds were handled of course by the treasurer in Philadelphia.

The MASTER: Did you find the stock contracts cancelled?

A. At least the Philadelphia records indicate the contracts have been retired.

The MASTER: I mean those that were paid?

A. Yes, they were retired.

At this time and adjournment was taken until 1:30 p. m.

3183 1:30 P. M., WEDNESDAY, *September* 13, 1911.

JAMES HALL continued on direct examination by Hon. H. W. Byers, testified as follows:

Q. In your examination and investigation of the books and records of the Des Moines Gas Company made by yourself and your assistants under your direction I wish you would state to the Master just the scope of that examination, the field you covered, the character of the books, pa-ers and records examined?

A. In regard to the operating accounts the examination covered a general review of the whole situation over five years and a more particular examination of all the entries of 1910 examining vouchers for payments and going into the matter very carefully.

Q. And were the entries as far as it was possible checked up with the vouchers and followed down to the origin of the item if possible?

A. Yes, for one years particularly, 1910.

Q. Now for instance to examine a voucher what is necessary to be done, what ought to be done by the examiner?

A. The man examining a voucher should pay particular attention to several things. First to see the voucher is addressed to the company or proper party, that a proper date is on, that is a date within the period of the examination, that the goods invoiced are in the ordinary course of that company's business, that the prices appear to be reasonable, that the account is properly charged, that is construction work it is charged to investment account, if operating to operating account. That the acknowledgment of the
3184 goods whatever it happens to be is properly O. K'd by a responsible party.

Q. And how long do you say you and your men were engaged in the work?

A. About 1040 hours altogether.

Q. That would be in days about how many counting the time that they put in, the hours?

A. Be about 140 ndays.

Q. What do you have to say about anything like an intelligent examination and investigation of these books and papers being made in say, five or six days?

A. Well I would not take much stock in it myself. I would not place much value on it myself. Personally I could not do it.

COURT: I don't understand that 1040 hours, what is that?

A. That is the time spent by the accountants making the examination of the books of this company.

Q. By yourself and the various men?

A. And the various men I had on the work.

Q. Have you examined complainant's exhibit 26 for the purpose of analyzing it and verifying it?

A. Yes, sir.

COURT: Which one is that?

Mr. BYERS: That is Mr. Hagenah's report, part of his report.

Q. To go back again to the former question, about the vouchers, about how many of these can a man examine in a day?

A. Well it depends for what purpose he is examining. In a case of this kind a man could not consistently examine more than about 250 a day.

Q. About how many were there altogether?

A. They run about 1800 to 2100 a year.

Q. Now then going back to the question with respect to Exhibit 26 I wish you would take that up and explain to the Master just
3185 what criticisms if any or errors if any you found in it and what criticisms you have to make of it?

A. It seems to me in this exhibit there is a fundamental error in the charge side.

Q. I think I stated in a former question that Exhibit 26 was a part of Mr. Hagenah's report. It is a supplemental sheet furnished

and presented here in evidence as I remember it and it is marked Exhibit 26, that is the one I am asking you about?

A. Yes, sir. This exhibit purports to show the annual investment value on an earning basis of eight per cent. It commences with the value of the plant at the beginning of the year, to that there is added eight per cent on value of plant. The addition to the plant during that year including an allowance for working capital. Eight per cent on the additions including working capital for six months, that is four per cent per annum. The operating expenses are added. Depreciation on a basis of two per cent on the depreciable property added making a total. From that is taken off gross earnings leaving investment value at the end of the year. Assuming the argument is all right on the statement the depreciation fund which is here charged should be set off in a fund and comp-unded at 8 per cent per annum and deducted from the investment value.

Q. And what difference would that make in Mr. Hagenah's conclusions?

A. That wo-ld make a difference in Mr. Hagenah's conclusions of $830,103.00.

Q. I wish you would go through that carefully, explain it to the Master how you work it out?

COURT: What interest do you take it at?

A. Eight per cent the same as charged, taking everything
3186 at 8 per cent, $830,103, that is depreciation of $392,662 compounded at 8 per cent the interest being $437,441.00 in round figures.

Q. Have you worked out a table that would show your method as compared with his and the difference in the recults?

A. Yes, sir.

Q. Do you have a copy of it?

A. Yes, sir.

Q. I wish you would take defendant's Exhibit 33 and start with the first table in it and go through it and explain your method and the difference and the reason why you make the corrections if any as you go along?

A. The first table in this statement is a copy of Mr. Hagenah's Exhibit No. 26. With the sole exception that it has been footed and a supplemental statement added to the right showing depreciation reserve compounded on the basis at which it was introduced. At the bottom of the table th-re is a summary showing the reconciliation or adjustment of this whole table. Bringing out the amended figure after deducting that depreciation compounded.

Q. Now will you explain why you adopt that method of adjusting Mr. Hagenah's figures?

A. Because I find that in his computations Mr. Hagenah has charged to operations in the plant with depreciation at 2 per cent per annum and has not built up a depreciation reserve or has not credited the plant or property account for the corresponding amount.

Q. Why is it necessary to do that?

A. Because the annual wear and tear of the plant is charged to the operations naturally decreasing the value of the property.

Q. And so you carry along the depreciation side and figure
3187 the interest on that?

A. Yes, sir.

Q. On the same basis that he adds it to the property?

A. Exactly. He adds to the property the depreciation, in determining his 8 per cent fund here he adds to the property depreciation of 2 per cent omitting the fact altogether that that property is decreasing in value to that amount on the assumption that the allowance is a proper allowance.

COURT: Let me ask you a question or two there. You take the $5,997 and you compound that for how many years.

A. I pass that up for the first year, the time it is entered the first year I pass that up. Then it is compounded until December 31st 1910 or the close of the computation, that is fifteen years.

COURT: Then the next amount for fourteen years?

A. Fourteen, thirteen, twelve and so on.

Q. In doing that you reached this total of $437,341.00?

A. Yes, sir.

COURT: What do you find the value of the plant to be under his plan there in that way?

A. Taking off that credit the value of the plant would be $2,306,-128 shown on the next page.

Q. Assuming that the basis of the Hagenah figures aside from the deduction you have made by carrying off this compounded on the sum depreciated, it would show a valuation, an investment value of $2,306,128?

A. Yes, sir.

Q. Now then what criticism do you have to make of that situation?

A. Referring particularly to this depreciation table?

Q. Yes, to any part of it.

3188 A. I might point out that had this depreciation reserve been set out each year in practice as it is in theory here to replacement or depreciation, charged to that depreciation reserve instead of being used in additions to plant, you would get exactly the same results that I have got now. In other words if the additions or replacement or even expense were charged off to that depreciation reserve the additions and expenses as shown on the debit side of this statement would be correspondingly reduced and the net result would be identically the same.

Q. That is the net result working it out on that plan would be the same as the result you find from your examination of the books?

A. Exactly.

Q. And the investment value as it worked out under your method?

A. Yes, sir.

Q. I notice that the adjusted value as you have worked it out here on defendant's Exhibit 33, is $1,774,913.00.

A. After making that computation for depreciation and interest I looked over the statement to ascertain how it was made up and in my opinion it should begin with the appraisal of 1895, that ap-

praisal having been accepted by both parties in the last suit, at least this is my understanding as a settlement of their troubles and basis for future work. Instead of that Mr. Hagenah goes back to 1886. Adjusting the statement to give effect to that and also eliminating $120,000 of bonds included as capital expended and which was used to pay off an old United Gas Improvement Company indebtedness, eliminating the Capital City Electric Light stock which was erroneously included, and eliminating the bond discount and expense of organization upon an 8 per cent, the same basis at which it went into the statement, these deductions the total result following Exhibit 26 is cut down to $1,774,913.

3189 Q. You stated a moment ago, I don't know whether I quite understood your answer or not, that by adopting your method and in working out Mr. Hagenah's method with your corrections and your addition the result would be the same as shown by your report aas to what the investment value of the plant was, is that what you intended to say?

A. Yes, assuming the investment value of the plant is the correct basis and taking out these additions which I consider erroneous the adjustment value therefore would be $1,774,913.00.

Q. In your own report the investment value is less than that is it not, you give it as less than that?

A. Yes, it is less, it is less for the reason that I have not compounded any loss under eight per cent earnings.

Q. I wish you would explain that to the Master, the difference?

A. The report Exhibit 30, does not capitalize early losses while this report of Mr. Hagenah's does capitalize early losses on a basis of 8 per cent.

Q. That is where the difference comes in between these figures, $1,774,913 and your figures?

A. Yes, sir.

Q. What do you have to say about the correctness of the methods of getting at investment value?

A. Well I hardly think this method is correct but I will say that I think the company is entitled to capitalize its early losses provided the early losses are not in any way attributable to bad management.

Q. And these socalled early losses that Mr. Hagenah has capitalized and compounded at 8 per cent, what do you have to say about that?

A. Well I don't think this is the correct basis.

3190 Q. This table here in Exhibit 33 called criticism of complainant's Exhibit 26, I wish you would explain that a little more fully so that we will all understand just what you are trying to get at in it.

A. That first half of that statement is a summary of exhibit 26 as put in evidence.

Q. That is a summary of the exhibit that you have just been referring to?

A. Yes, sir.

Q. And brings out an investment value of the plant December

31, 1910 $3,136,231.00. The cost of the plant as stated in this Exhibit 26, including working capital is $2,064,118.00. Allowing for working capital and accepting the statement in Exhibit 30 we have an appraisal plus additions of $1,796,528 or a deficiency of $237,490 as compared to this exhibit 26.

Q. And how do you account for that?

A. That appears to be represented by the bonds used to pay off liabilities including $120,000, inclusive of bond discount and organization expenses $40,873, inclusive of the stock of the Capital City Electric Light Company, capitalized erroneously $2,553 and the adjustment of the book value January 1, 1895 over the appraisal of $96,698 and a small difference which I did not look into $7,366 making up a total of $267,490. Now taking that item or these various items compounding them at 8 per cent we find the value of the plant according to Exhibit 26 should be reduced by the aforementioned amounts $267,490, interest on the first three items for four years approximately $55,825, interest on another item fifteen years approximately $207,900 and depreciation $392,662 together with interest compounded at 8 per cent $830,103 a total deduction of $1,361,318 bringing down the investment value of the
3191 plant adjusted to $1,774,913.

COURT: Where do you find that here?

Mr. BYERS: It is on the thirtd sheet of this Exhibit 33.

Q. Have you any question at all about the justice or accuracy of the method you have adopted here in this table in revising Mr. Hagenah's figures to $2,774,913?

A. Assuming Mr. Hagenah's basis to be right that would be the result.

Q. And the proper result?

A. Yes, sir.

Q. Now have you taken Mr. Hagenah's basic figures, if that is a proper term to use, his value of plant the beginning of the several years of the period covered by him and worked it out on the basis of six per cent?

—. No, I accepted our own figures throughout Exhibit 30 and put them up on the same method as Mr. Hagenah and worked it out on the six per cent basis.

Q. I wish you would go through that and explain that to the Master how you get it?

A. That would bring out an investment value of plant on a six per cent basis $941,268.

Q. Worked out in exactly the same way by using your figures as to the value of the plant at the beginning of each year?

A. And the subsequent additions to the corrected revenue allowing six cents for depreciation.

Q. And taking $50,000?

A. At the commencement and right through on to the last year.

COURT: What do you get as the result?

A. $941,268.

Q. That is the investment value on a six per cent basis?

A. Six per cent basis.

3192 With $50,000 working capital charged each year until the last and the last year you charged $68,000?

A. Yes, sir.

Q. Now have you a similar table worked out on a seven per cent basis?

A. Yes, sir. That would give a net investment value of $1,143,505.

Q. That is the following table?

A. Yes, sir.

Q. That is the investment value of the plant on a seven per cent basis?

A. Yes, sir.

Q. Taking the appraisal value to begin with?

A. Adopting the same figures throughout on both tables six and seven per cent.

Q. And taking $50,000 capital each year?

A. Yes, sir.

Q. And your six cents of depreciation?

A. Yes, sir.

Q. Showing an investment value of the plant on a seven per cent basis of $1,143,505?

A. Yes, sir.

Q. Have you the next table proceeding in the same way upon an eight per cent earning basis?

A. Yes, sir.

Q. What does that work out?

A. Brings out an investment value of $1,377,197.

Q. Then if I understand you taking the cost of this property as as shown by the books beginning with the appraisal of 1895 and adding $50,000 as working capital all through until the last year and including your six cents depreciation, working it out

3193 on the same method Mr. Hagenah works his out except as to depreciation there is a difference between the investment value as shown by your method represented by the difference between $1,377,197 and $1,774,913.

A. Yes, sir.

Q. And what would that exact difference be in figures?

A. $397,716.

Q. In other words, the figures you have just given represent the other side of the count that Mr. Hagenah failed to carry on through his computation?

A. Yes, sir.

Q. Referring to Exhibit 23 if you have it before you, page 25, I find this statement on that page "An examination of the vouchers and authorizations of your company shows that it has benefitted very materially by such purchase when it is considered that the accounts of the company have been charged with costs based upon such favorable conditions of purchase the benefit resulting to the construction account and to the operating account is apparent." What do you have to say about any such indicated benefits from any investigation or examination you made.

A. It was not apparent to me.

Q. It goes on and says further "For these services your company has until recently paid no compensation except several small payments incurred for drafting services on particular assignments. During the last year your company has paid for these services at the rate of $10,000 per year. Through the payment of this charge your company is spared the expense of maintaining a large engineering department and decreasing its office staff for executive, accounting and auditing purposes." What do you have to say about
3194 that statement from your examination?

A. Well it may be true to a certain extent but it was not apparent to me.

Q. Was not apparent?

A. No, I don't think it would be necessary myself to increase the office force any if the Philadelphia office did not exist.

Q. That is in your judgment the office force——

A. The present office force could run that place I think.

Q. Is ample?

A. Seems to me so.

Q. And how did you find the fact to be if you found anything about it as to whether or not the U. G. I. made regular and systematic charges for such work as it did do and the expenses that it incurred in auditing and supervision and all that?

A. Well I saw no record of them charging anything in respect to auditing but they did make charges in respect to advertising services and engineering services, rate regulation expenses and a few things of that kind.

Mr. BYERS: Defendant at this time offers in evidence Defendant's Exhibit 30 which is the report of the witness Hall; Defendant's Exhibit No. 31 which is entitled Des Moines Gas Company rate litigation expenses; Defendant's exhibit 32 which is a computation made by Mr. Hall and defendant's Exhibit 33 under the title of Des Moines Gas Company investment value of plant December 31 1910 in which is included the criticisms as stated by the witness of the report of the witness Hagenah.

Mr. GUERNSEY: The complainant object to Defendant's exhibit 30 on the ground that it does not purport to show the value of the property in question and is irrelevant and immaterial and for the further reason that what it contains with reference to earnings
3195 and operating expenses is not predicated upon the actual results at any time of the property in Des Moines or of the business done in the city of Des Moines.

Cross-examination by N. T. GUERNSEY, Esq.

Q. What did you say your vocation is?

A. Public accountant.

Q. Just what is the scope of the duties of a public accountant?

A. Well they are quite wide. They include practically all matters relating to accounts, the auditing of accounts on behalf of directors, stockholders and investors, investigation in cases of this kind or for

any other purpose, investigation on behalf of bankers to determine the earnings of concerns or capital invested for the purpose of floating bonds or preferred stock, acting as secretary, treasurer or comptroller, or acting as receiver in the liquidation or winding up of a company, acting as trustee in bankruptcy or in deceased estates settlements, that is the very broadest interpretation I can give you of it.

Q. What do you mean by auditing accounts?

A. Making a detailed examination of the accounts of every class, scrutinizing all accounts on behalf of stockholders or directors.

Q. Is it necessary on behalf of stockholders or directors?

A. Yes, an audit would be always on behalf of the stockholders or directors.

Q. Suppose it was in behalf of creditors?

A. That would be an investigation and would not embrace in many lines as great detail as an audit.

Q. Suppose a creditor employed you to do the same thing a stockholder or director employed you to do would it still not be an
3196 audit or would be a rose under another name?

A. Call it an audit but advise my client it did not require the making of detailed investigation as I would under an audit, most cases would not, ninety nine out of a hundred would not. That is an audit is almost always an annual occurring event you go in each year and check the accounts over for that year.

Q. That is simply an annual audit?

A. Well there is practically no difference, an audit means practically an annual audit or semi annual or quarterly.

Q. You can examine the books two ways or the accounts two ways can you not. That is, you can make an examination that not only goes to the books, but goes beyond the books?

A. Yes, sor.

Q. And goes to the question whether or not the entries as made on the books are correct?

A. That is the purpose of the examination.

Q. That is an audit isn't it?

A. Yes, sir.

Q. That is what distinguishes an audit, the fact you go back of the books and back of the examination of vouchers and by independent investigation if you please, ascertain whether or not the entries on the books are correct.

A. Yes, the same thing applies in investigations, you endeavor to go behind the books as far as possible.

Q. But that is the distinguishing characteristic of an audit, the fact you do not accept the books, but go behind the books and check to ascertain whether or not the entries made are correct before you draw any conclusions from those entries?

A. Yes, sir.

Q. Now you may also make an examination of books with-
3197 out going behind the entries on the books may you not?

A. Yes, sir.

Q. Now what do you call that?

A. That would be more of an investigation.

Q. That would be an investigation?
A. Yes.
Q. You said that in this work here there had been expended 1040 hours?
A. Yes, sir.
Q. You had a memorandum at which you looked. You kept a memorandum did you not showing the amount of time each person expended upon the work?
A. Yes, sir.
Q. And when?
A. Yes, sir.
Q. Now how much time did you personally devote to this work?
A. I was up to the date that memorandum was prepared 100 hours.
Q. What is the date when that memorandum was prepared?
A. August 31st.
Q. And at what dates did you do this work?
A. I had three or four days in July and the remainder of the time in August the exact dates I can't give you.
Q. Can't you look at the memorandum?
A. The exact dates are not there. That is simply a summary of the time.
Q. Will you furnish these exact dates?
A. I can't do so until I go to Chicago.
Q. Can't you write for it or telegraph?
A. I can do so.
Q. Will you do so?
A. I can get the detailed time sheets if necessary.
3198 Q. I don't care for that.
A. Yes, I can get you that.
Q. Well will you get it?
A. Yes, certainly.
Q. Since the date of that memorandum how many hours have you devoted to this?
A. About forty or forty five hours probably.
Q. And when?
A. Several hours last week in the office on Saturday and each day this week, Monday, Tuesday and Wednesday.
Q. How about Sunday?
A. I was not engaged on that on Sunday.
Q. This report is dated the 19th of August if my recollection is correct. When was it in fact completed?
A. It was completed on or about the 19th day of August.
Q. And on what part of this report then was the work that was done by you after that time done?
A. The work after that time was done on these criticisms of exhibit 26.
Q. And when was that completed?
A. It was completed last Friday.
Q. Now how much of the time that you have devoted to this have you spent in Des Moines?
A. About eighty hours or ninety hours. I spent one complete

week here and I spent three or four days other times. Roughly 80 to 90 hours in Des Moines.

Q. When was that complete week?

A. The week preceding August 19th.

Q. Who directed the scope of this examination?

A. I did.

3199 Q. Without suggestion from anyone else?

A. Entirely.

Q. And who indicated to you the four fundamental question- I believe that you state in the inception of the report?

A. That work is mine.

Q. So that this was your own idea of the work that it was necessary to do in an order to answer those questions?

—. It was.

Q. Of course you yourself have not examined these vouchers?

A. No, sir; I did not.

Q. Now turning to those four questions I notice that you have very frequently throughout your report referred to the amount of stock and bonds issued. I wish you would state upon which one of these questions you regard that as material?

A. I would not regard it as material to the answer of any question but I do regard it as material to a general understanding of the situation.

Q. It would have no bearing would it on the cost of the property?

A. Not a bit.

Q. And it would have no bearing would it on the cost of manufacture?

A. None.

Q. And it would have no bearing on the results from the ninety cent sales?

A. None.

Q. It would have no bearing on the capital investment would it?

A. No, sir.

Q. Now is there any other matter you have treated as prominently in this report as you have this matter that you say is immaterial to these fundamental questions?

A. I didn't know I had given that undue prominence,

3200 that was not my intention.

Q. Is there any other matter which you have treated as prominently in your report as you have this matter which you say is immaterial to the determination of these questions?

A. Yes, I consider I treated the five fundamental questions more prominently than I did that stock question.

Q. Each one of them more prominently?

A. Yes, sir.

Q. Before we go into this further I want to take up a matter you referred to this morning because you referred to it in such a way I could not at least make head or tail out of it. You attempted as I understood it this morning to take the Capital City book value of March 1, 1906, and reconcile it with your conclusions.

A. Yes, sir.

Q. Now will you give us those figures and give them to us slowly so we can put them down and see just what you claim about that?

A. The capital city company had a book value on February 28, 1906, of $1,565,230.09.

Q. Book value of the assets of the Capital City Gas Light Company?

A. Yes, sir.

Q. Now then what is the next step?

A. I deducted the excess of the book value at January 1, 1895, from the appraisal value at that time.

Q. Deducted the difference between the book Value January 1, o895 and appraisal as of that date?

A. Yes, sir.

Q. And what is that amount?

A. $211,468.16.

Q. What is that $211,468.16 made up of?

A. It is made up of the book value of the water gas plant
3201 and patents at January 1, 1895 namely $200,000 over the amount at which they were appraised $27,903.05.

Q. That $211,468.16 is obtained as indicated just above that same amount on page 22 of your report?

A. Yes, sir.

Q. Now, what is the next thing?

A. The next deduction was $134,297.44 also indicated on page 22.

Q. That is the next sub total on page 22 of your report?

A. Yes, sir.

Q. Now what is the next step?

A. I took one from the other, the smaller amount from the greater giving $1,219,464.49.

Q. Now what is that $1,219,464.49?

A. Appeared to be the actual cost of that property accepting the appraisal of the basis up to February 28, 1906.

Q. By actual cost you mean the cost as shown by these books?

A. As shown by these books taking that appraisal as the basis.

Q. Now what is your next step?

A. Add to that the estimated cost of the new gas holder $120,000.

Q. That gives you what?

A. $1,339,464.49.

Q. What is the next step?

A. Add the Valley Junction properties $45,000. Gives an adjusted cost of $1,384,464.49.

Q. That is what it cost January 1, 1906.

A. No, February 28, 1906 accepting the appraisal.

Q. I mean February 28th. Now stopping on that a minute that don't represent the actual cost as a matter of fact does it?

A. No.

3202 Q. And it represents something less than the actual cost?

A. It does.

Q. And you use actual cost as I use it there, that is as shown by the books?

A. As shown by the books, yes.

Q. Who suggested that you start with this appraisal?

A. That is my own idea.
Q. Who told you that there was an appraisal?
A. I looked up the old record.
Q. What record?
A. The troubles you had here about 1894 or '95, I got a copy of the papers through Mr. Brennan including a copy of Col. Pratt's appraisal.
Q. Then Mr. Brennan furnished you a copy of that old record?
A. Yes, sir.
Q. That was shortly after you came here?
A. Yes, sir.
Q. What authority if any did you find in that record for the statement you have made so often that this appraisal was agreed to?
A. That was my understanding of the matter that that appraisal——
Q. I know, but I didn't ask you that, I asked what authority you found in that record for that statement?
A. I don't know whether I found any particular authority in that statement I found the appraisal O. K.'d by Mr. Pratt and accepted it.
Q. Did you go far enough into that record to find out what became of that case?
A. It was compromised I got that length.
Q. Who told you that this appraisement was accepted by both partids at that time?
3203 A. I was not told so. By no one to my recollection.
Q. You just took it for granted?
A. Well yes you charge so. That being submitted by the company I accepted that as the actual record of what happened and what was agreeable to them.
Q. I am not getting at that, but you have stated a great many times in your examination that that was an appraisement that was agreed to at that time.
A. That was my understanding of it.
Q. Where did you get that understanding, who told you that?
A. I don't recall that I was told so.
Q. Well did you find anything in the record that said that?
A. I don't recall seeing that in the record.
Q. You did find out in the record there was a dispute as to the value of the property?
A. I don't know that I did that, I have no recollection of observing that.
Q. How much of the record did you have?
A. That I could not answer very well. I got about the appraisal and accepted it and disregarded the rest. I didn't read it all, didn't attempt to.
Q. Did you have anything except the appraisal?
A. I don't recall seeing anything except the appraisal and a number of statements about earnings which I did not pay any attention to is all I recall seeing.
Q. So you have no authority for the statement you have made

so frequently that this was an agreed appraisal or that this appraisal was accepted by both sides?

A. No, I will amend that by saying that was an appraisal submitted by Col. Pratt and accepted by me.

3204 Q. Now have you given us all of the figures relating to this reconciliation of the book cost with the book value as shown by the books of the Capital City Gas Light Co. February 28, 1906 that you referred to this morning?

A. No.

Q. Will you please?

A. I endeavored to see how that amount was built up.

Q. How which amount was built up?

A. The amount $1,384,464.49.

Q. Let's have those figures?

A. That was built up by Capital City bonds amounting to $400,000.

Q. What do you mean by built up?

A. The investment was derived from the sale of bonds.

Q. Capital City bond- how much?

A. $400,000. Out of the Des Moines Company bonds issued for the gas holder, of the Valley Junction properties or rather assumed to be issued for the holder and Valley Junction properties, $165,000. The liability to the United Gas Improvement Company $105,526.49. The surplus earnings from 1886 to 1906 $627,959.16 and the original capital stock of the Capital City company $300,000.

Q. That gives you a total of what?

A. A total of $1,598,485.65. You take from that the water gas set abandoned $211,468.16 as shown on page 22 and the electric company's stock charged to plant $2,553 and brings you down the result of $1,384,464.49.

Q. There is one thing I don't understand, this Capital City Gas Light Company statement we are working on isn't it?

A. Yes, sir.

3205 Q. How do you get Valley Junction into the Capital City Gas Light company did they ever own it?

A. Now so far as I know, I am quite agreeable to eliminate it on both sides of that statement gives the same result.

Q. Well but is it in the amount $1,565,230.09?

A. It is not no.

Q. And is there a trace of it on the books of the Capital — Gas Light Company?

A. There is not.

Q. Well then upon what theory is that item an item to be taken into account in order to ascertain that reconciliation of book value on the Capital City Gas Light Company's books?

A. It is an endeavor to reconcile the books of the Capital City Company and the Des Moines company is what started us.

Q. February 28, 1906——

A. The Valley Junction properties and gas holder came into existence between midnight February 28, and starting business March 1st.

Q. Do you mean that?

A. As I understand it from the books. I don't know about the actual facts, it is what the books would indicate.

Q. Well, would you expect the books of the Capital City Gas light company which did not own this property to show when it came into existence?

A. I would expect them to show this gas holder.

Q. You would expect the books of the Capital City gas light company which did own this property to show when it came into existence.

A. What do you mean by this property, Valley Junction?

Q. Valley Junction or the holder?

3206 A. In regard to Valley Junction no, in regard to the holder, yes.

Q. Then you assume the Capital City Gas Light Company owned it?

A. My understanding of the matter is so far as my information on the facts that the gas holder was started prior to February 28, 1906 and not completed until subsequent to March first 1906 that is as near as I can get information about that gas holder was commenced and the contract let by the Capital City company.

Q. What basis have you for that statement that the contract was let by the Capital City company?

A. By the Capital City company or by the United Gas Improvement Company one or the other, I don't attempt to say which.

Q. What basis have you for the statement the contract was let by one or the other? As I understand it you are an accountant and deal with facts?

A. As far as I can obtain the facts and I endeavored to obtain the facts from Mr. Curren.

Q. Now I want to know what basis you have in these books or records for the statements you made there if any?

A. There is absolutely nothing in the books about it.

Q. So you have no basis in these books or records for that statement?

A. Not from the books and records, no.

Q. Did Mr. Curren say to you the Capital City Gas Light Company had made the contract for that holder prior to March 1, 1906?

A. He didn't specially say the Capital City, but made the statement the contract had been made for the holder prior to that date.

Q. Do you as an accountant think that that statement warrants you in running this item of $120,000 into the books of the Capital City Gas Light Co.?

3207 A. I am not putting it in their books.

Q. You are using it to reconcile an item found on those books the day before the Des Moines Gas Company went into business?

A. No, sir. Using it in an endeavor to connect up the Capital

City books with the Des Moines Company books at the time it commenced business.

Q. You told me a few moments ago this amount you added to the figures was for the purpose you stated to find how this amount $1,384,164.49 was built up. I asked you what you meant by built up and you told me you meant the securities the Capital City Gas Light Company issued for it.

A. Yes, sir. And if you will permit me to finish the statement I started on you will get the rest of the figures, you have not got them all.

Q. I would prefer to conduct it in my own method. I want to stick to this proposition first. I want to know why you consider as securities building up this item on the books of the Capital City Gas Light Company bonds issued by the Des Moines Gas Company which at the time this item, of course at that time had not been organized and the bonds had not been issued or authorized?

A. I am endeavoring to build up the account of the Capital City Company and get it up with the opening account of the Des Moines company. It is therefore necessary to bring the items into account somewhere.

Q. Well go on with your other figures and see if we can see what you mean?

A. In the $1,384,164.49 the following securities were issued by the Des Moines company.

Q. You are running two things together, now you are
3208 starting in with the Des Moines Company March 1, 1906 aren't you?

A. Yes, sir.

Q. That was the second proposition you put up this morning?

A. It is all part of the same.

Q. All part of the same?

A. So far as I am concerned, yes.

Q. Now then you keep referring all the time to this water gas plant and patents as appear on the books $200,000. What was the cost of these things as shown by the books?

A. As far as I can judge there was an issue of $200,000 bonds issued in payment of the water gas set and the patents.

Q. And your figures do not show that as a part of the cost of the property of this company?

A. They do not. Pardon me, they do to the extent of $27,903.06 as appraised by Col. Pratt.

Q. So that your statements here neither show cost nor value do they?

A. They do not.

Q. Did you do it this way, did you take cost where that was low and value where you could get it where that was low and make a combination of the lows?

A. No, I did not.

Q. Now if you had gone back a little further instead of starting with this so called appraisement your investment would still have been higher wouldn't it?

A. It would have been some higher than the appraisal, yes.
Q. But you didn't do that?
A. No.
Q. You knew from your examination of the books that that was true didn't you before you made this selection?
3209 A. Yes, sir.
Q. And you selected the low one?
A. Yes, sir.
Q. Now I want to go back — page 5 here for a minute. At the bottom of that page you show as I understand it some costs of manufacture not as shown by the books, but as corrected by you?
A. Yes, sir.
Q. Now give us just the items that you added and subtracted.
A. From the two months' period to February 28th, 1906, I took out the charge for accidents and damages $3,685.17.
Q. You took that out because the accident did not occur in the two months.
A. Exactly.
Q. That amount had actually been paid had it not?
A. It had.
Q. And had been paid during that period?
A. Yes, sir.
Q. Now what is the next item?
A. I deduct from the ten months ending December 31, 1909, $333.18 covering replacement value expenses. For the year 1910 I take out $5,602 for the same expense, for replacement values or expense of making an appraisal.
Q. These replacement value expenses are expenses that were incurred by the company in connection with the appraisement of the property in connection with this suit.
A. Yes.
Q. Now what else did you deduct if anything?
A. I deduct the interest on the floating debt.
Q. What year?
3210 A. For each year.
Q. What are the amounts each year?
A. The first two months $487.00. For the year to 1907 $3,590.71. For the year February 29, 1908, $2,308.48. For the year to February 28, 1909, $49.50 and for the year 1910 $690.84.
Q. What do they total?
A. I can't tell you offhand.
Q. Can you total them for me?
A. I can, yes. $16,746.88.
Q. Have you given us all the adjustments?
A. No, sir.
Q. Well all of the deductions?
A. Yes.
Q. Now what additions/ did you make?
A. I added in in the year 1910 the corporation tax paid in 1911 $1,287.37.
Q. Anything else?

A. I reversed your interest charges increasing your expense by $32.40 for the first two months, being February 28, 1906.

Q. Let's have the items?

A. I am giving them as far as I can, I reversed your interest by increasing expenses.

Q. What were the items?

A. Interest charges.

Q. For what?

A. On the treasurer's account, credits on interest and floating debts, miscellaneous credits.

Q. Can you give us these items?

A. The details?

3211 Q. Yes.

A. I can get them for you.

Q. Well will you?

A. Yes.

Q. How much do they amount to in the aggregate?

A. $1,508.54.

Q. I don't understand just exactly just what that interest was that was interest that the company earned on balances?

A. Yes, and it is credited to the expense account.

Q. And that is where the company had earned some interest it had deducted it from the operating?

A. Yes.

Q. You took that out?

A. Yes, increasing expenses by that amount.

Q. Now what other deductions did you make?

A. That is all. I moved the federal tax, the corporation tax back from the year 1910 to the year 1909.

Q. Let's have the items on that?

A. $1,447.61.

Q. That went back to 1909?

A. Yes, sir.

Q. What was the total of these deductions or additions to the operating that you made?

A. I increase your expense by $2,795.91.

Q. Now deduct that from the $16,746.88 will you please?

A. The result is $13,950.97.

Q. That would run between two and a half and three cents a thousand for gas sold?

A. On one year it would be about two and a half cents, yes.

Q. And if you divide it by five it would decrease the operating about half a cent on the average?

3212 A. It would increase operating about half a cent.

Q. You don't increase operating by making these deductions do you?

A. If I put in these various expenses I would increase your expense by about half a cent per thousand over five years.

Q. But these things you put in you take out as a matter of fact?

A. Exactly, I reduce your operating expense by about half a cent over five years.

Q. Now you testified on your direct examination did you not as follows: "Now you may state what the fact is as to whether these figures which are the basis of your final averages are shown and were taken from the books of the company, actual operations of the company. A. In all cases subject to one or two minor adjustments."

A. Yes, sir.

Q. Are these what you refer to as one or two minor adjustments?

A. Yes, sir.

Q. You were not exactly right?

A. Yes, I would call these minor adjustments.

Q. And one or two?

A. Yes, sir.

Q. As a matter of fact you told us then didn't you, you went on as follows: "Q. What were these minor adjustments. A. The elimination of a charge made by the company for the expense of regulating rates in the city. The company charged that expense as an operating charge and I exclude it on the ground that it has nothing to do with the consumer." And then you also specified this item of federal tax and said that these were the two adjustments you had made?

A. And somewhere else in the testimony in regard to expense and in all cases referred to the interest, I said I excluded interest
3213 on bonded and floating indebtedness.

Q. Now what provision did you make for accidents and damages?

A. Made none.

Q. That was not right was it?

A. Yes, under the circumstances. We asked if any accident claims were outstanding and on August 18th, after this report had been prepared I received a list of claims. I inquired what liability attached to the company and got a response that none was admitted. I state in the report that an allowance should be made for accidents, no attempt to dispute that it should be.

Q. Of course there should be something for accidents shouldn't there?

A. Certainly.

Q. Before I forget it, how soon after you made your request about the accidents did you get the information?

A. I can't answer that. Mr. Sangster acting for me made the request several times.

Q. While you were there?

A. No.

Complainant moves to strike out what the witness says as hearsay.

Q. Did you yourself personal-y make any request?

A. No.

Q. Or anybody make any request in your presence?

A. No.

Complainant moves to strike out the testimony of the witness as

to such requests as being hearsay, secondary and not the best evidence.

Q. Now to get at what would be a fair charge for operation
3214 for these years there must be an addition of something made on account of accidents and damages.

A. If any liability exists certainly.

Q. Well you know don't you that whether there is liability today or not that there will be expenses of that kind?

A. Personally to be quite frank I would approve of an allowance being made in the accounts for damages.

Q. It would be a very fair way to put that to allow the amount that would be necessary to buy that insurance wouldn't it?

A. Yes, if you made an allowance equivalent to purchasing protection it would be quite fair.

Q. And that would have to be added to these totals and averages here on page 52x to get at what would be a fair basis to use in connection with the operation of this property wouldn't it?

A. Yes, provided your expense as already charged for accidents and damages is inadequate. You have an allowance——

Q. You have eliminated the accidents and damages?

A. Not altogether, no sir. Only in the first two months. I only eliminate in the first two months the accidents and damages that period applying to a former period.

Q. How much have you left in that you did not eliminate in the way of accidents and damages?

A. I left it all in except $3,685.17.

Q. How much did it amount to in dollars, let's get what that is. You left in didn't you, if you will turn to Exhibit D of your report, $4,506.84 in the five years aside from these two months?

A. No, I left in $8,755.43.

COURT: Where do you find that?

A. In Exhibit "D" second page.

Q. I read the wrong amount there. That covers the five
3215 year period except two months?

A. Yes, sir.

Q. You left claims undisposed of growing out of the operation during this period for how much?

A. $151,500.

Q. Made no provision for them at all?

A. None at all.

Q. Now do you think that that is just exactly right?

A. No, I think a provision should be made for accidents.

Q. Well why didn't you make it then in making estimates of this cost for these various years that you ask us to take as a basis for fixing a rate?

A. I inquired as to what liability attached to these accidents and received no estimate.

Q. You have had some experience about such things haven't you?

A. Yes, sir.

Q. Well then don't you know the only way you can find out the extent of liability is at the end of a law suit unless you adjust it?

A. I do unprofessionally.

Q. You know that the suits would involve expenses even if no liability?

A. That is so.

Q. And you know that something ought to be added to these operating expenses on that account?

A. Yes, and said so on page 31.

Q. But you didn't attempt to make any estimate but made your estimate of what we would earn based on leaving these things out?

A. Yes, if perhaps you will permit an explanation that I received these estimates on August 18th after this report was prepared and I was told I had to testify the following Monday that was
3216 I think August 21st. That would have involved the whole rewriting of this report, recalculating everything, that would have taken ten days.

Q. How soon after that did you learn we had adjourned for two weeks?

A. Several days afterwards.

Q. You still made no attempt to correct this?

A. I was otherwise engaged, had no time to attempt to correct it. I think I did the fair thing by you by stating the claim existed and should be considered.

Q. A fair way to get at that would be to ascertain what liability insurance would have cost for that period of five years there and then deduct from that the amount which we actually paid would it?

A. Yes, that would be very fair.

Q. Now then why didn't you take the general taxes and work them back the way you did the federal taxes?

A. I didn't observe that there was any outstanding liability December 31, 1910.

Q. I know, but you have a statement in here of the amount of taxes each year don't you? What page is that on?

A. 16.

Q. But haven't you these taxes in dollars and cents somewhere in your report?

A. It would be on Exhibit "D" I think.

Q. Now your taxes begin with $13,000 and run up to $27,846 that we paid in the year 1910 don't they?

A. Yes, sir.

Q. It is morally certain those taxes will not be any less isn't it?

A. That I don't know.

Q. You have never observed?

3217 A. They have a tendency to increase, I observe that.

Q. Then if you wanted to get at what would be a fair basis for taxes for instance when we are talking about making figures about the future, it would not do to take this average of four years which shows an increase of something like 100 per cent would it?

A. No, it would not do to take the year 1910 as compared to the year 1907, that would be hardly reasonable.

Q. And it would not do to say where the taxes had gotten up to $27,846.06 in the year 1910 and where in the year 1910 the assessment has been increased enough to bring them up to $31,000

for the taxes of 1910, do you think it is exactly fair in estimating future earnings to take not the existing conditions but the average of four or five years?

A. Yes, I think taking that average in conjunction with other averages it is quite reasonable.

Q. No, but just take that alone by itself. You are morally certain you would be low on the taxes aren't you?

A. That average will be a little low on taxes.

Q. Be too low on taxes?

A. It is liable to be low on taxes.

Q. You say it is liable to be. It is certain to be isn't it?

A. Almost I would say. I don't know local conditions, I would say almost.

Q. So that if we wanted to get something that would afford a fair and accurate basis for an estimate as to the future we ought to revise these tax matters ought we not?

A. No, unless you are prepared to revise all other matters in the same connection.

Q. Now when it came to the tax which the company would
3218 pay to the city on the ninety cent basis where future payments would be reduced you very carefully made that deduction of one fifth of a cent. One fifth of a cent a thousand would amount to about $1,200 a year.

A. About that, yes.

Q. If it is worth while to take that into account where our taxes have increased in the last year from $27,846 to about $31,500 some four times that, and during these four years where you take the average the taxes have gone up from $14,000 to $27,000 do you think that ought to be taken into account too?

A. Yes, I think you are entitled to take into consideration any legitimate expense you show is going to be abnormally increased.

Q. Well don't you think you ought to have done it?

A. I was not aware your taxes were up.

Q. You knew what your report showed?

A. Yes, sir.

Q. You knew the report showed the taxes of $13,978.44 in the year ending February 28, 1907, and the year ending December 31, 1910 they were $27,846.06 just about twice that amount?

A. Yes.

Q. You knew that?

A. Yes, and if you take that in relation to the basis of sales you will find the jump is not in the same ratio.

Q. Oh I don't mean that it is, but what I am getting at is this I wish you would take these amounts here, our taxes for the five years and get the average for the five years, the average in dollars and cents. Don't do that for the present, maybe I can save that work. Turn over to your Exhibit "E" page 2, you will find taxes for the
year ending February 28, 1907, were 3.59 cents per thou-
3219 sand.

A. Yes, sir.

Q. Now for the year 1910 they were 5.24 cents per thousand?

A. Yes, sir.

Q. The difference is about one and three fourths cents, isn't it?

A. Yes, sir.

Q. Do you think it is exactly fair to us to very carefully deduct a decrease in taxes of one fifth of a cent and ignore an increase of one and three quarters?

A. Yes; I don't think it is unreasonable taking the average expense as a whole.

Q. But I am talking about this one item.

A. Well answering that, if I had been dealing with the one ite-, not all the other items, I would have given an increase in all probability.

Q. The only reason you resort to averages is because of the variation of these things up and down isn't it?

A. Yes, sir.

Q. We don't need to do that in the case of taxes where we know the variation is going to be one way.

A. It is not always one way according to this statement.

Q. Don't you understand what makes that difference in the pers there, don't you understand why you get for instance in 1908 6.87, 6.52, 7.66 in 1909 for ten months?

A. I don't know why they drop in 1909 as compared with 1908.

Q. You know they assess once in two years?

A. I didn't know that.

Q. And the first year you pay under your new assessment you would find your actual rate in dollars increased and the rate per thousand would be increased naturally. Then if you stay on
3220 the same assessment and make any increase in sales there would be a little reduction naturally in your rate per thousand the next year?

A. Naturally.

Q. And then go up again. Didn't you know that?

A. No. I thought your assessments were every year as everywhere else.

COURT: These calculations made here are on a thousand cubic feet of gas.

A. Yes, sir.

Q. Now you know don't you that the taxes for the year 1910 are paid in the year 1911 in this state?

A. Yes, sir.

Q. I find here and I think that was shown by the testimony of Mr. Parker that the assessment of the company for taxation made in 1909 was $1,184,200 and that the assessment made in 1911 was $1,385,000. An increase of just about $201,000? Now at the rate of ninety mills which was the old rate of taxation that tax would amount to $31,162.50. I wish you would divide that by the sales in Des Moines, not Valley Junction and so on, but in the city of Des Moines and see what you would get for taxes?

A. 5.98 cents.

Q. Your taxes that are contained in this statement on page 5 include also two cents to the city don't they?

A. Yes, sir.

Q. So we would have to add two cents to that to make a comparison?

A. Yes.

Q. And that would give us 7.98 cents or substantially 8 cents?

A. Yes, sir.

3221 Q. Now the tax that you took in your three estimates that you made of net return were 6.65, 7.22 and 6.78 were they not?

A. Yes.

Q. So that they were all except the year 1910 more than a cent and a half under the present rate?

A. Then if we wanted to get at actual results, if a man was putting his money in he would want to add a cent or so on that score as well as adding something on the personal injury account to really make an estimate that he would want to bank on as to what his operating was going to be wouldn't he?

A. Yes, sir.

Q. And you think it is just as important to do that as it is to deduct the one fifth of a cent that you carefully deduct on page 6?

A. No. If I was investing in your plant I would like to see where I could reduce my expenses.

Q. If you were putting your money in you would want to be very sure however in your estimate of earnings and things of that kind that you had not got operating too low?

A. I would be very careful about it.

Q. Instead of being careful to exclude the doubtful items you would be careful to include them?

A. I would review them both.

Q. Now I want you to turn over if you will to your computation on page 7 for a minute. You base all of your results here on one year don't you?

A. Yes.

Q. And the year that is most favorable to your contention, that is right isn't it?

A. No, I didn't regard it as being the most favorable year. I took it as the last year.

3222 Q. You knew if you took an average of five years that the average net return would be lower than what you got the one year didn't you?

A. No, I did not.

Q. You did not.

A. I did not. I took the last year.

Q. You didn't make any computation of that kind?

A. No, I didn't. Took it for one year.

Q. Now turn to this table here on page 7. In the first place you include Valley Junction as well as Des Moines?

A. Yes.

Q. Of course that increased your net result some because they sell gas at $1.50 in Valley Junction.

A. Yes.

Q. And that makes your calculation on Des Moines to that extent erroneous, that is based on incorrect premises.

A. It is impossible to base it on a correct premise, it is impossible to eliminate Valley Junction.

Q. Didn't you at Cedar Rapids eliminate the outside towns?

A. I have no recollection of what happened at Cedar Rapids.

Q. You could not say you did not?

A. I would not say I did or did not.

Q. How long ago was it?

A. Four years.

Q. You testified there?

A. Yes.

Q. There you eliminated outside towns?

A. I don't know.

Q. Without knowing whether you did or did not do it there, you think still it is impossible to do it.

3223 A. I don't think from judging this case on its own merits you could get a proper premise without Valley Junction.

Q. You have here a heading, total revenue. Now opposite the words total revenue you have—have you the actual revenue at Des Moines, $538.893 or something that is estimated?

A. That is the actual figure.

Q. Taken off the books?

A. Shown by your books, yes.

Q. The $482,532.34 is estimated?

A. Yes.

Q. You have operating expenses under the next line?

A. Yes.

Q. That means one thing in one column and another thing in the nect column?

A. Yes, it does.

Q. Why is that put in there, to confuse?

A. No, not intended that way.

Q. It was done intentionally?

A. Not intended to confuse.

Q. Right opposite that same heading operating expense net you have in the one column operating expense without adding anything for depreciation and the other column operating expense plus depreciation.

A. Yes. The statement is estimated before adjustment and after adjustment.

Q. That adjustment refers to rate don't it?

A. Not altogether, no.

Q. What other adjustments were made?

A. This depreciation was added in as an expense.

Q. Then you have these operating expenses there they are not the actual operating expenses shown on the books are they?

3224 A. $346,000?

Q. Yes.

A. No they are slightly adjusted in 1910.

Q. They are less than the books show?

A. They are I think—yes, they are a little.

Q. And then when you say net revenue available for interest and other charges $192,107.65, that is not correct is it. You would have to take out depreciation first.

A. Yes, you would.

Q. So that you can't look from one of these columns to the other and compare these figures that have the same heading and make a fair comparison can you?

A. Not without reading the context.

Q. You can't anyway compare these figures, you have got to make some computations because net revenue available for interest and other charges as to one column means one thing and another column means another.

A. It does, yes.

Q. There is another thing here I notice that you don't seem to have taken into account. The new ordinance don't provide for a penalty in the event of a failure to promptly pay the bills.

A. There is no penalty.

Q. That will increase the expense of collection won't it or increase the loss on account of bad debts?

A. I don't know that it will.

Q. Have you ever had any experience in the gas business?

A. No.

Q. Have you the remotest idea why the practice is to impose a penalty if bills are not paid promptly.

A. I know there is a penalty imposed in certain towns.

3225 Q. Have you any idea as to why?

A. In order to get the money in promptly.

Q. To decrease loss and decrease the cost of collection, you can't imagine any other reason for it?

A. That is what I would understand would be the reason yes.

Q. When you take that out you have got to add expense haven't you something of that kind?

A. I don't know that would make any appreciable difference to your expense.

Q. Don't you think it would make about as much as one fifth of one cent per thousand which you carefully deducted on account of these taxes?

A. It might. It would all depend on how good a collection department you had. There might be additional loss, it would not be very serious, however.

Q. It is an expense item you have not taken into account?

A. I have not.

Q. And that would have to be taken into account if we want to get a correct conclusion?

A. Provided it can be demonstrated there is an extra expense there.

Q. Have you enough experience *tioh* the gas business to know?

A. I would not like to say definitely, no.

Q. Would you if you were an investor say here I will put my money in and just assume there won't be any expense unless you can demonstrate there will be, is that the attitude of an investor?

A. No, if I was an investor I would look into the matter very carefully.

Q. In other words, you have not made a report here such as you would make to a man that was going to buy some bonds have you?

3226 A. Yes, substantially, in a certain way it is and a certain way it is not.

Q. This is not the kind of report you would make to a man if he wanted to know what he could rely on if he was going to buy some bonds?

A. No, I would not report along the same lines at all.

Q. You would not throw out all these detailed items of operating would you?

A. It would altogether depend, if I was endeavoring to show the man what he could make in operating this business I would proceed very much along the same lines I have here.

Q. Would you deduct from the operating an item like one fifth of a cent and ignire an item like two cents, would you ignore an item like this accident and damage and ignore an item like Valley Junction that would amount to about a cent?

A. I have not ignored the item of accidents and damage.

Q. You have no computation with reference to that part of it?

A. Yes, but I state in the report you are entitled to it.

Q. Valley Junction would amount to another cent wouldn't it?

A. No, I don't think quite. About .7 of a cent is my recollection.

Q. You have made a computation on it?

A. Yes, which I worked out in this report.

Q. Whereabouts will we find that?

A. On page 20.

Q. Your report shows that your estimate on ninety cent gas is that the income will be 90.70 cents?

A. Assuming Valley Junction at $1.50.

Q. Pretty near one per cent.

A. Three fourths of one per cent.

Q. You have added one per cent of ninety cents, that would be what? .9 of a cent?

3227 A. Yes.

Q. So you have added 7/9 of .9 of a cent to the gross revenue then?

A. Yes, sir.

Q. Too much bother to take it out?

A. No.

Q. Have tp come out before we could get an accurate result here wouldn't it?

A. No, I don't think you can disassociate Valley Junction with Des Moines.

Q. Suppose Valley Junction reduces the price and in the mean time you had fixed a rate here relying on excess earnings out at Valley Junction?

A. If Valley Junction reduces the rate you have got to consider that.

Q. Otherwise you can't rely on the excess earnings of Valley Junction to sustain your Des Moines rate, that is what you do in your report.

A. Not to any appreciable extent.

Q. About one per cent?

A. Not if you pro rate your investment between the two properties I don't think you get one per cent on it.

Q. But in your income here?

A. The income is higher on account of Valley Junction certainly.

Q. Who invested this method of using the low items and getting low operating expense for the year that you have adopted here?

A. That is my own.

Q. You invented that?

A. Yes, sir.

3228 Q. Invented this in this case?

A. Yes, sir.

Q. Never tried it before?

A. Not that I recall.

Q. Now will you turn that around for me, pick out the highest things you could get here out of operating, get the highest operating you could get or do you think that would be fair?

A. Distribution.

Q. Well take manufacture what is the highest there?

A. The highest there is 36.89 in 1907.

Q. The highest in the balance is in the year 1910?

A. Yes, sir.

Q. It would be a good thing to put these together wouldn't it?

A. Yes.

Q. That would be fair wouldn't it?

A. No, I don't think it would.

Q. You have just reversed it haven't you?

A. No, I don't think I have exactly.

Q. The expense for the two months to February 28, '06 making up the 67.13 there, 36.82 for manufacturing the balance 30.31 are they not?

A. Yes.

Q. And the next year that balance deducting the manufacturing—take the year 1907 you have 6486 as the total and the balance after deducting the manufacturing is 27.97. That is right isn't it.

A. Yes.

Q. In 1908 your balance of your 63.49 after deducting manufacturing is 28.36?

A. Yes.

3229 Q. And in 1909 the corresponding balance is 26.35?

A. Yes.

Q. And ten months in 1909 32.17?

A. Yes.

Q. Average for the four years to December 31, 1909, 28.77 cents.

A. Yes.

Q. In the year 1910 35.43 cents?

A. Yes.

Q. And for the average of the five years it is 30.30?
A. Yes.
Q. Now then when you came to make your estimate of return here you took that low manufacturing in 1910 the lowest there was in the whole period?
A. Yes.
Q. And then you took the *varage* for the four years up to December 31, 1909, 28.77 which was lower than the manufacturing for the year 1910, and lower than the average for the five years didn't you?
A. Yes.
Q. Now add those two together will you please 29.76 and 28.77.
A. 58.53.
Q. So you took as a basis a cost there that was lower than anything that the company had ever experienced didn't you?
A. Yes, sir.
Q. Thought that was fair didn't you?
A. Yes.
Q. If you were putting your money in that is the way you would do wouldn't you?
A. I would figure that way among others.
Q. You would rely on that if you were making a report
3230 to somebody about somebody you would make your report like that?
A. Yes, I would.
Q. Never did before?
A. Never had occasion to.
Q. Never have done it?
A. Not so far.
Q. You have made reports to people buying bonds or contemplating it?
A. Yes.
Q. Did you ever in estimating operating expenses in such report pick out low items like these and put them together?
A. No, I never had to.
Q. What do you mean by had to, do you mean you had to here in order to get the results you wanted?
A. No, I do not.
Q. Do you know what made that low manufacturing in 1910?
A. Yes, a considerable reduction in the price of oil and other expenses, general improvement in the art.
Q. Your report shows what made it don't it?
A. Yes.
Q. What page?
A. Page 11.
Q. Now then I wish you would tell us what the average cost of oil was per thousand for the four years preceding 1910?
A. 15.75.
Q. What was it in the year 1910?
A. 11.49.
Q. Now what is the difference?
A. 4.26.

Q. I wish you would subtract that difference in the price
3231 of oil from the average manufacturing cost for the five years, what do you get?

A. 28.78 cents. 4.26 from 33.04.

Q. The average cost of oil for the five years ending December 31, 1910 is what as shown by your report?

A 14.78.

Q. The cost in the year 1910 was what?

A. 11.49.

Q. What is the difference?

A. 3.29.

Q. Now subtract that from the cost of manufacture for the five years 33.04, what do you get?

A. 29.75.

Q. Then what do you get as cost of manufacturing in the year 1910.

A. 29.76.

Q. The difference is .01 of a cent isn't it?

A. Yes.

Q. So that the difference between the average cost of manufacture for the five years and the cost of manufacturing for the year 1910 is accounted for by the difference in the cost of oil with the exception of .01 of a cent?

A. Yes.

Q. Now under these circumstances do you say that this average manufacturing costs are abnormal?

A. I don't say so and never did.

Q. The average manufacturing cost for the five years are 33.04 cents aren't they?

A. Yes.

Q. And for the four years ending December 31, 1909, they are about one cent higher?

3232 A. Yes.

Q. Now what is there then that justifies you in taking as the basis this abnormally low manufacturing cost and tying it up to the lowest aggregate of the other costs you could find out of these three columns?

A. The fact that you have been able to reduce manufacturing cost to 29.76 justifies us in taking that figure, that is your actual cost that year.

Q. Then did you apply the same theory, work the same line out or did you take it only where reduced?

A. No, I disregarded the total distribution in 1910 because an abnormal year as compared to preceding years.

Q. If you will take that item of oil out the total cost there of operation for 1910, 65.19?

A. Yes.

Q. Now deduct this difference in the price of oil between that year and the average for the five years which is 3.28?

A. 3.29. Leaves a balance of 60.05 of a cent.

Q. Oh no it don't.

A. Taking 3.29 from 63.94?

Q. But I told you to take it from 65.19?
A. 51.09.
Q. Then if you take this item of oil out of that which was abnormally low that year compared to these other years you find that the year 1910 is lower than any other year that you get there don't you or any other average?
A. Except the year to February 28, 1909.
Q. Now then let's try this one other way. Take the difference between the price of oil for the four years ending December 31, 1909, which was 15.75 cents per thousand cubic feet and its cost
3233 per thousand for the year 1910, 11.49 you have 4.26 cents don't you?
A. Yes.
Q. Now if you deduct that from the expense for the year 1910 you will get a result that is lower than your average for the four years, lower than your average for the five years won't you?
A. Yes.
Q. And this one item is lower for that year than it is for any other period there.
A. Yes.
Q. Now then what was there in these expenses for the preceding four years that made you say that their aggregate as against the aggregate for 1910 was normal?
A. The general appearance, running about an average, running even general appearance would indicate quite normal expenses.
Q. Well general appearance is pretty vague. Did you analyze the expenses of this company for any other of the other years?
A. We investigated them in a general way.
Q. Did you analyze the expenses of this company for any other years of its existence?
A. Only in a general way.
Q. So in saying these were normal you only took one other year to compare them with?
A. Yes.
Q. You called attention to some extraordinary expenses as you called them in 1910 didn't you?
A. Yes.
Q. That is some expenses on account of lowering mains because the city changed the grade of streets?
A. Yes.
3234 Q. That of course would involve changing all the services and would run that item up?
A. Yes.
Q. Now do any of these other years include expenses of that kind?
A. Not so far as I observe them.
Q. They are expenses that may occur?
A. They may yes.
Q. And an average that don't include something on account of those expenses would not be a sound basis for conclusions as to the future would it?

A. No they are reasonable annual expenses.

Q. And the averages you have taken do not include them do they?

A. Don't include any such large items, they include ordinary work connected with mains and services.

Q. If we relied upon such computation when these large items came we would not have any money to pay them with.

A. Oh I don't know; I think you might.

Q. It would be fairer wouldn't it to take an average that included a year that did involve these items as well as years that did not involve them?

A. Yes, that is why I took an average of five years, considered it a fair thing to include that expense in the average.

Q. The fairest way to get at the prospective operating expense is to take an average over a period of time isn't it?

A. Yes.

Q. But that is not the method which you adopted in figuring out your return here is it?

A. Yes, I did take an average over a period of time.

Q. Did you?

A. Yes, in operating expenses.

Q. In which computation, point out the computation
3235 based on an average over a period of time?

A. Page 10 and again on page 20.

Q. Let's take them one at a time. The first computation is based on the year 1910 isn't it?

A. Yes.

Q. The next one is not based on an average for any period is it? It is based on taking the lowest manufacturing cost you could find and then tying that up with an average for four years of 28.77 isn't it?

A. Yes.

Q. So that is not based on an actual average of any series of years?

A. Based on actual average as regards operating, distribution expenses.

Q. And taking the low item for manufacture?

A. Yes.

Q. The next computation there is not based on the average for any term of years?

A. Not as you term average no.

Q. Now is there any computation that there is here in your report that is based on an average for a term of years?

A. Not as you reason averages.

Here the further hearing was adjourned until 9:30 a. m. tomorrow.

3236 Thursday Forenoon Session

SEPTEMBER 14, 1911—9:30 a. m.

Counsel for the respective parties all present.

Testimony on part of defendants resumed as follows:

JAMES HALL, continuing his cross examination, examined by N. T. Guernsey, Esq., testified:

Q. Now, yesterday morning on your direct examination, or day before yesterday, Mr. Hall, you referred, on page 3121 of the record, to the item of donation to J. Haines, $711, and afterwards you made some changes. How did you come to make that original mistake.

A. Improper understanding of the entry as it appeared on our notes.

Q. Then you were just testifying from some notes?

A. Exactly.

Q. Did you ever see the voucher yourself?

A. I looked up the voucher after the testimony was given that night.

Q. But prior to that you had never seen the voucher?

A. No, sir.

Q. And that is true of most of those vouchers?

A. It is.

Q. And you are simply testifying from notes made by your subordinates and not from your own information?

A. Yes, sir; that is so.

Q. And you are not testifying from your own information about these vouchers or books?

A. That is so.

Q. Now this voucher showed just exactly what that Haines transaction was, didn't it?

A. Yes.

3237 Q. And it was accompanied by a receipt filed with the voucher, there was a receipt from each person to whom a part of the $711. had been distributed?

A. I didn't check them up: it was accompanied by a number of receipts which I didn't examine.

Q. Well didn't you think to make such an examination as you said was proper it would be necessary to run through and see where that money had gone?

A. No, I did not: to run through in detail, no.

Q. Now you found out when you came to investigate that the Company distributed this amount, giving to each of its employés on Christmas on edollar for each year that the employé had been in the service of the Company?

A. Yes.

Q. And accompanying the voucher, the original voucher for $711. were apparently receipts from each one of the employés for the amount given to him?

A. Yes.

Q. Do you think there was anything improper in that item?
A. I didn't suggest it.
Q. And your original suggestion that it was *was* due to a misapprehension on your part?
A. Entirely.
Q. Now, then——
A. Pardon me, I don't think I ever suggested that the item was irregular at all or improper.
Q. You referred to it in your testimony as a donation, didn't you?
A. I think I referred to it as a bonus.
Q. I will refer to the record and see what you did say. Item "Donation to J. Haines $711."
3238 A. Yes.
Q. Now is that the way it was described on the memorandum from which you were testifying?
A. Yes.
Q. Then of course that memorandum was wrong?
A. It was incomplete.
Q. Well it was wrong?
A. Yes I would call it wrong.
Q. It was grossly wrong in the inference it carried?
A. It was grossly wrong to accept that inference from it, but my inference was corrected; it was partly my own fault accepting that interpretation.
Q. What I am getting at is this: have you checked up this other memorandum from which you are testifying?
A. Yes, a great part of it in totals, yes.
Q. Have you checked this other memorandum from which you are testifying?
A. Not all, no.
Q. Have you checked one per cent of them in detail?
A. I don't think I checked any in detail.
Q. So that there is a possibility of other errors of this same kind in the construction of the items?
A. That is always possible.
Q. That possibility is very much increased where it is second hand; an inference is drawn from an inference of somebody else?
A. There is always that danger, yes.
Q. Did you make any of the figures in this report?
A. Yes, I wrote the report and made the figures.
Q. Well by that you mean, don't you, that you drew conclusions?
A. I drew conclusions—I wrote them up from the state-
3239 ments submitted.
Q. That is, you checked, take for instance these exhibits back here, you didn't make all those figures, did you?
A. No.
Q. And did you make this chart?
A. No.
Q. Who made that?
A. Mr. Sangston.

Q. He was one of your assistants?
A. He was in charge of that work.
Q. In general he did the work on the books, didn't he?
A. Yes.
Q. And made the figures and you made the computations from the figures and drew the conclusions, and so on?
A. Yes.
Q. Now I want to take up these figures here on depreciation for a moment. I think it is on page 17 that I want to refer to. Now you have a total there on the middle of the page?
A. Yes.
Q. And that is intended to justify your six cents as showing that taking into account the other repairs you will get somewhere near from ten to twelve cents, as you said above?
A. Yes.
Q. Where did you get that ten to twelve cents?
A. That is my understanding what a reasonable allowance would be for repairs and up-keep.
Q. Who told you?
A. I don't know that anybody told me in particular in this plant. I discussed the matter with Professor Marks what it should be when we were making this up; and of my own knowledge that is
3240 generally considered in my experience as a fair allowance.
Q. Now Professor Marks suggested that six cents was the right figure, did he?
A. No, I suggested six and we talked it over generally, and he said he thought it was all right.
Q. Your experience in gas cases has been rather limited?
A. You may call it that.
Q. Three or four cases?
A. Three or four cases.
Q. Your experience is not br*oo*d enough to give you a basis for forming a conclusion, is it?
A. I have passed judgment on depreciation as charged in accounts generally.
Q. Well, most of them do not have earnings enough to charge off depreciation?
A. Most of them there is not.
Q. Well, most of them haven't earnings enough——
A. No, most of them claim there is no such thing as depreciation.
Q. Well, we will pass that now. You made up this table on this page?
A. Yes.
Q. Now will you turn to Exhibit E and tell us what the repairs works were for the two months ending February 28, 1906?
A. 2.06 cents.
Q. And what did you put them in on page 17?
A. 2.32.
Q. That increased that and helped to get you up to your average?

A. No, that was the correct average taken on the basis of sales, making a uniform standard.

Q. How does it happen that your repairs works as you state
3241 it on Exhibit E is one figure and as you state it on page 17 it is another?

A. It is got by taking different divisors. In Exhibit E it is the quantity manufactured and on page 17 the divisor is the quantity sold.

Q. Then you do not take the divisor that is ordinarily taken, on page 17?

A. I took the divisor that would bring that up to the standard, the same basis.

Q. The same basis as what?

A. Uniform basis of cents per thousand sold.

Q. Of cents per thousand sold?

A. Yes.

Q. What do you mean—do you mean that over here on Exhibit E you get at your pers for the manufacture, and dividing by one divisor in one case and another in another?

A. I give the cost, taking the quantity manufactured, and the cost of gas distributed, taking the quantity distributed.

Q. When you get back to your Exhibit E, you got your repairs works by dividing the actual amount, which we will find in Exhibit E, by the amount of gas manufactured?

A. Yes.

Q. If you adopted that figure that would have brought your total of six cents and something down lower than you have it?

A. It would, yes.

Q. And it would have been further away from your average, as stated above?

A. Which is upon the wrong premises.

Q. Now do you know of anybody else that has worked out this repairs works in two methods in the same report without
3242 calling attention to the difference so that people won't be misled by it?

A. No, I don't think there is any intention to mislead. I think it is quite clear here. It states it is on the basis of sales.

Q. Now what statement do you refer to, the statement that shows you adopted a different method here?

A. It does not directly point out a different method. It is clear this is made up on the basis of sales.

Q. Tell me the statement contained in your report that points out the difference so that we may know the repair works is pointed out in any one place?

A. It is not pointed out specifically.

Q. Is it pointed out unspecifically, or at all?

A. No, it is quite obvious.

Q. That would make a difference of 2.7 cents there?

A. Yes.

Q. Setting and removing meters, how did you get that into your repairs; that is not a repair item?

A. It is my understanding it is. You take out an old meter and put a new meter in and you are repairing the property.

Q. Will you tell us some classification that warrants that conclusion?

A. I don't think I can.

Q. There isn't any?

A. I haven't seen it.

Q. You never heard of that item being treated that way before?

A. I think I have. It is my understanding from the city engineer and Professor Marks that is all right.

Q. You got that from Professor Marks too?

A. Yes.

Q. Turn over to Exhibit E and you have repairs meters in one place?

3243 A. Yes.

Q. Then you have setting and removing meters as a separate item and not as repairs?

A. Yes.

Q. You say you checked these over carefully with the vouchers and the books to see that they were right?

A. Yes; they were checked over, yes.

Q. Now, then, did the vouchers in the way of setting and removing meters covering that item show a dollar spent for repairs?

A. I can't answer it; I didn't see the vouchers personally.

Q. So that at the suggestion of Professor Marks you added this item that was not a repair to these repairs?

A. I am not advised by Professor Marks that is a correct classification for it.

Q. Did you look at any classification?

A. I have seen all the classifications one time or another.

Q. You know none of them are treated that way?

A. It is not specifically called repairs.

Q. It is not repairs?

A. I couldn't tell.

Q. You don't know whether this is proper repairs or not?

A. I wouldn't like to say.

Q. Still you put it in here as repairs because Marks said so?

A. Yes.

Q. Did you go over your report before you made it, with Marks and fix it up with him?

A. No, he has never seen it. I discussed these questions I had any doubts on with Professor Marks.

Q. If you take your .27 cents on repair works and your .97 cent for setting and removing meters, which is not repairs, you

3244 have a total of 1.24 cents?

A. Yes.

Q. That should be deducted from your 4.82 if you want to get the actual repairs for that period?

A. No, I wouldn't concede that at all. I might concede meters, knowing nothing to the contrary, but I won't concede the other.

Q. You think for the purpose of this computation repairs works

should be taken as 2.32 cents and for the purpose of Exhibit E should be taken as 2.06 cents?

A. Yes.

Q. And for every other purpose in the report it should be taken as 2.06 cents?

A. Yes, but that is adjusted on account of the leakage.

Q. Now, then, will you take 1.24 from the 10.82 and tell us what we have there instead of 10.82?

A. 9.58.

Q. Now, then, referring to Exhibit E, will you tell us what repairs works were for the next period?

A. 2.32.

Q. You have them 2.49?

A. Yes.

Q. The difference is .17 cent?

A. Yes.

Q. You add .82 cents for setting and removing meters?

A. Yes, sir.

Q. That makes .99 cent?

A. Yes.

Q. Now deduct that from the 10.88.

A. 9.89.

Q. In the next year what are the repairs works?

3245 A. 1.46.

Q. You put them in at 1.55?

A. Yes.

Q. And the difference is .09?

A. Yes.

Q. And you have them setting and removing meters 1.04?

A. Yes.

Q. Making a total of 1.13?

A. Yes.

Q. Will you deduct that from the 10.61?

A. 9.48.

Q. For 1909 your repairs works is 1.28?

A. Yes.

Q. Over in Exhibit E it is 1.21?

A. Yes.

Q. And that is a difference of .07?

A. Yes.

Q. Then you have added there on account of setting and removing meters 1.13?

A. Yes.

Q. And that makes 1.20?

A. Yes.

Q. Deduct that from the 10.45?

A. 9.25.

Q. Now take the next period you have, 2.03 for repairs works, and Exhibit E shows it 1.91?

A. Yes.

Q. That is a difference of what?

A. .12.

Q. And then you have 1.33 for setting and removing meters?

3246 A. Yes.

Q. That makes a total of 1.45?

A. Yes.

Q. Deduct that from 11.78?

A. 10.28.

Q. For 1910 you have 2.67 for your repairs works; what does Exhibit E show it?

A. 2.55.

Q. A difference of .12 cent?

A. Yes.

Q. For setting and removing meters you have 1.01?

A. Yes.

Q. Total 1.13 cents.

A. Yes.

Q. Deduct that from the 13.42?

A. 12.29.

Q. Now what will that give you as an average for the four years where you get 10.89?

A. The average for the four years, 9.69.

Q. And the average for the five years?

A. 10.30.

Q. So that in either event we get under an average of from ten to twelve cents and to that you add six cents?

A. Yes, sir; on your basis.

Q. You don't say your basis is right?

A. If my information is correct.

Q. You mean Professor Marks says it is right?

A. Yes.

Q. So far as you yourself know, it is not?

A. Allowing for the setting and removing meters, I think it is?

3247 Q. You don't know of any good reason for calling setting and removing meters repairs?

A. Admitting that, I would take a cent off the estimated allowance.

Q. You don't know of any good reason for calling setting and removing meters repairs?

A. I am prepared to admit that, but I would make an allowance for that in making the computations.

Q. In order to get us up to the average of ten or eleven cents you would have to add a cent to your depreciation?

A. No sir, if I found I made a mistake in the setting and removing meters I would make that allowance.

Q. While on this matter of depreciation, you referred a good many times or at a considerable length of time in your direct examination to an item of $264,108.28; that was continually referred to as charged to depreciation; you remember that item?

A. I remember that item, yes sir. I don't think I have referred to it as being charged to depreciation.

Q. On page 3139 of your direct examination you testified: "Q.

Now right at that point did you find or were you able to ascertain just why $264,108.78 was charged off for depreciation? A. I don't know why it was done." Now that would be an inference that was charged to depreciation?

A. No, I don't think so.

Q. What do you say to this, on the same page: "Q. In other words, they took their surplus, what appeared to be surplus earnings and wiped it out by charging it up to depreciation? A. Yes, sir." Would you say that carries the inference that was charged to depreciation?

A. No.

Q. I want to know whether you think that this question
3248 stating that this was charged up to depreciation, and your answer, "Yes, sir," would carry the inference that it was charged to depreciation?

A. It couldn't be charged to depreciation.

Q. I am not talking about what was done as a matter of fact.

A. I wouldn't consider that at all.

Q. You would not infer from the question and answer I just read, which I will read again: "Q. In other words, they took their surplus, what appeared to be surplus earnings and wiped it out by charging it up to depreciation? A. Yes, sir." You wouldn't say that would lead to the inference, if a man was reading your testimony, that was charged to depreciation?

A. No, I would not.

Q. Now, you go on a little further on page 3140 and you say: "Q. Your depreciation account for the whole 16 years was only $245,000? A. Yes, less for the 16 years than they make for the three years. Q. They wiped out more in three years than you did the whole 16? A. Yes, sir." Is it exactly fair to compare three years to the 16 years in that way?

A. I am not attempting to compare it. They reduced the property more in that period than I did in 16 years.

Q. How much did you charge up to depreciation in that three year period, that is covered there, which is something more than three years?

A. About three years and four months.

Q. That would make your figures, your charges for depreciation, of course, run higher in the late years than in the earlier years, on account of increased sales?

A. Yes.

Q. So that it would not be fair to compare three of the
3249 later years with the 16 years as an average?

A. There is no comparison suggested.

Q. I didn't ask you that. It would not be fair to make such a comparison?

A. Certainly not.

Q. Now on page 3140, take this question: "Q. But in the sworn statements they have made for the last two years and made since that depreciation charge appeared on the books, has it appeared in any of these statements? A. Not so far as I have seen them. Q. I mean so far as you have been able to find? A. No, certainly has

not appeared in the federal tax statement, be no tax to pay if it did." Do you think that would lead a person reading your testimony to infer that amount had been charged to depreciation?

A. No, I don't think it would.

Q. Now, in the next place, what statements did you examine—you were asked whether it appeared in any of those statements?

A. Do you refer to the federal tax statement?

Q. I want to know what you are talking about here in the question "But the sworn statement they have made for the last two years and made since that depreciation charge appeared on the books, has it appeared in any of these statements? A. Not so far as I have seen them."

A. I saw no statement; the question was asked in regard to the federal tax statement.

Q. I want to know what statements you referred to?

A. I had in mind the federal tax statement.

Q. Did you see any of the statements?

A. No.

Q. Did you see the federal tax statements?

A. No; I saw the Company's receipt for one payment.

3250 Q. You never examined any of these statements?

A. No, I haven't.

Q. Has anybody else examined them and told you what the statements contained?

A. No.

Q. Now, then, as a matter of fact that was not charged on the books to depreciation?

A. No, it was not.

The MASTER: That $264,000?

Mr. GUERNSEY: Yes.

A. It was charged to the plant account.

Q. Have you copies of the entries in the books?

A. Yes.

Q. Will you let me see them?

A. Yes.

Q. Now with reference to this item, all that you have here indicating what appears on the books is this: Profit and loss $264,108.78. Now the next line, property and plant, $264,108.78. Now the first amount there on the first line appears on the left hand side and the second amount on the right hand side, and following that "to close balance of account." I read that correctly, did I?

A. Yes.

Q. Now is that all that appears on the books with reference to this item?

A. Yes.

Q. All the rest of your testimony about that is more inference?

A. Not altogether.

Q. It is not a statement of what the books show, is it?

A. No, it is an interpretation of the books.

3251 Q. Yes, inference. Now then, turning to your report, can you tell us roughly how much you think you should have

charged off on the property account on that date, to bring it down to what you claim is right?

A. No, I am making no claims as to what should have been charged off.

Q. You are talking here about water and things like that; didn't you mean your testimony to be understood as a criticism of those things?

A. Not at all. I have no objection to watering, if you care to call it that.

Q. Now, then, to go back, in your judgment what should have been charged against the property account, or credited to the property account—that is right, isn't it?

A. Yes.

Q. As of the date of this entry to bring that property account down to what you say was the value of the property?

A. I have no views on it at all.

Q. You haven't?

A. No, sir.

Q. You absolutely know nothing about it?

A. I do, but it is a matter for your own judgment as to whether you care to write down the value of the property as you have it or not.

Q. I am not asking for your recommendation or judgment, but you have in your report charged off to beat the band, to be a little slangy.

A. I have excluded items which did not appear to have any tangible value.

Q. Now if we had been attempting to charge off what you
3252 have called water in the stock, how much would we have had to charge off of profit and loss and credit up to the property account at the time the entry was made?

A. Approximately $2,300,000.

Q. Do you think there was any impropriety in this entry?

A. I do not suggest it. I am not suggesting there was any impropriety.

Q. So far as you know, it was an absolutely proper entry?

A. I have no reason to doubt it at all.

Q. When was it that you paid so much attention to this on your direct examination, and why was it you called attention to the fact that this was on a page that was inserted, if you regarded the entry as an entirely proper entry, and did not want us to infer there was something wrong there?

A. I simply stated the facts.

The MASTER: I would like to see the copy of that letter directing the entry.

A. Here is an extract from the letter. (Witness hands paper to Master.)

Q. Where did you find the letter directing this entry?

A. In the files.

Q. Whereabouts?

A. I haven't any idea; it was got out for me.

Q. By whom?

A. One of the men over there.
Q. Did you ask for it?
A. Yes, sir.
Q. How did you come to ask for it?
A. I wanted to know the authority for making the entry.
Q. Why did you want to know that?
3253 A. Out of curiosity.
Q. It was not such an entry as would be made by the book keeper in the ordinary course of business without some authority?
A. Certainly not.
Q. He ought not to make it without specific and definite authority?
A. Very definite authority.
Q. That was what I was getting at—you were asked whether this entry was not made by order from Philadelphia; now who makes the entries, the man that keeps the books, don't he?
A. Yes.
Q. He has no authority to make any such entry unless somebody gives him specific instructions?
A. No, sir.
Q. It would be absolutely wrong to do it?
A. It would.
Q. Was there any impropriety to your mind in his receiving instructions as to this entry from the treasurer of the Company?
A. None.
Q. That would be a very natural and proper thing, wouldn't it?
A. Certainly.
Q. In fact, if you had found the entry without some such authority, you would have said the entry was suspicious?
A. I would, yes.
Q. So that you referred to this letter and read the authority from the letter into the record in order to show there was nothing suspicious to this entry, didn't you?
A. Exactly.
Q. We have been discussing principally some of the factors that go into these operating costs and depreciation; now from the basis of the computation which you refer to on page 8 is it not?
3254 A. Yes.
Q. Now you say here, first, that the expense of operating the property for five years would indicate that the year 1910 was abnormally high. Now if you were putting your money in, you would want to have an estimated operating basis on high years as well as low years?
A. I would.
Q. That is the only fair way to do it?
A. Yes.
Q. Now do you remember in the Cedar Rapids case you based your estimate on five years and protested or criticised the estimate of the Company based on two years as wrong and based on not long enough a time?

A. I am sorry, I don't recall anything about Cedar Rapids.

Q. Passing that, to look it up, you say on page 8, the average distributing and other expenses for the four years immediately preceding 1910, and also for the five years including 1910 can more reasonably be regarded as indicative of normal conditions. We have therefore prepared computations to be afterwards explained taking the manufacturing cost for 1910 and added the average distribution and other expenses just referred to. That is the basis which you took for computing your net income?

A. Yes.

Q. That is correct?

A. Yes, sir.

Q. Did you make the figures yourself?

A. Yes.

Q. I will ask you now whether you testified—I am reading from page 529 of the record of the Cedar Rapids case, in the case
3255 of the Cedar Rapids Gas Light Company against the City of Cedar Rapids, Iowa, at the October term of the District Court of Linn County, Iowa, when that case was tried—I think at the city of Marion——

A. No that case was tried in the city of Cedar Rapids.

Q. I will read several questions and answers: "In your report Exhibit K-2, I notice you have taken a period of five years, while Mr. Kellogg has taken the books for a period of two years only; which is the proper method——

Objection.

(Question continues) in order to show or ascertain the true cost of the manufacture and distributing gas as shown by the books? A. For the purpose of determining the cost of any article such as gas, or determining the duration of any factor the period of five years is generally recognized as standard. The period of two years does not represent the operations of the company fairly and accurately." Did you so testify?

A. I remember very little about the case.

Q. Is it true, as you stated in Cedar Rapids, that the period of five years is generally recognized as a standard?

A. Five years, yes, except under exceptional conditions, five years is regarded as a fair average.

Q. If you had taken five years here you would have gotten a less return?

A. I took five years for your operating, but your manufacturing is slightly different.

Q. Did you testify: "Why is that the case? A. In a year or two years there may be extreme charges. For example, in this case the fittings account in the years 1905 and 1906 are very heavy. They ought to be spread over a series of years, and it is not expected that five years will cover such heavy charges. Q. Take the period
3256 of two years as Mr. Kellogg has done, instead of five years, what effect will that have in showing the general result as cost applied to the manufacture and distributing of gas? A. It

shows a much heavier cost; it shows forty-five cents more on an average of five years." Did you so testify in Cedar Rapids?

A. I presume so if it is there.

Q. Do you remember whether you did so testify or not?

A. I don't recollect what I did.

Q. It is true, however, is it not, as stated here, if you wish to get results that are reliable you must take a period long enough to cover high years as well as low years?

A. Yes; of course there is exceptions.

Q. It depends on what you want to show, don't it?

A. Not always, no.

Q. Now, then, I wish you would do something else for me. Take this table on page 5 and will you please—leaving out the two months' period because that is short—I wish you would pick out the highest item for manufacturing, that is the first thing there and the lowest?

A. The highest is 36.89.

Q. What is the lowest?

A. 29.76.

Q. Now, then what is the highest item on distribution and the lowest?

A. The highest is 8.49.

Q. The lowest?

A. 4.67.

Q. Now then what is the highest on commercial expenses and the lowest?

A. The highest, 9.01.

3257 Q. The lowest?

A. 7.31.

Q. Take the next item, new business, the highest and lowest.

A. The highest 4.76.

Q. The lowest?

A. 2.96.

Q. Now take the next item, general expenses?

A. The highest 4.90.

Q. The lowest?

A. 2.19.

Q. Take the next item taxes?

A. The highest 7.22.

Q. The lowest?

A. 5.56.

Q. The next item, leakage?

A. 2.78 the highest.

Q. The lowest?

A. 1.35.

Q. Now will you foot these columns and let me know what your totals are?

A. The highest 74.05; the lowest 53.80.

Q. Now, then, what is the smallest credit on account of miscellaneous sales?

A. .01.

Q. Will you deduct that from the high total there?
A. 74.04.
Q. The greatest credit on account of miscellaneous sales?
A. .08.
Q. Now, Mr. Hall, in order to tabulate this so it will be easy to get into the record, will you take either your copy or mine
3258 and read the account and figures into the record?
A. I will make a copy of it and he can copy it into the record.
Q. This memorandum showing the highest and lowest, I will ask you to hand to the reporter and ask him to copy it into the record.
A. Yes.

(Presents memorandum to reporter).
The memorandum is as follows:

	Highest.	Lowest.
Manufacture	36.89	29.76
Distribution	8.49	4.67
Commercial Expense	9.01	7.31
New Business	4.76	2.96
General expenses	4.90	2.19
Taxes	7.22	5.56
Leakage	2.75	1.35
	74.05	53.80
Miscellaneous sales	.01	.08
	74.04	53.72

Q. Now turn to page 9 and that shows per thousand feet sold, 19.71, 27.28 and 25.53?
A. Yes.
Q. Now that 19.71 is based upon what as total operating?
A. The actual of 1910.
Q. The actual of 1910 as revised by you?
A. As revised by me.
Q. That you find on page 5?
A. Yes, I think you will find it on page 19 also.
Q. We will turn to that, which is 57.62 before adjustment?
A. Before adjustment. On top of page 20 you will find the basis for the second one.
Q. To compare it with the figures we just made, 74.04 and 57.62?
A. Yes.
Q. The other is 59.37, the second method?
A. Yes.
3259 Q. So that if you adopt the method that you have adopted of combining the manufacturing cost of 1910 with the average of the four years, you get as a total operating cost, 57.62 cents per thousand?
A. Yes.

Q. Will you subtract 53.72 from that and see how near you got to the bottom?

A. 3.90.

Q. You are within 3.90 cents of the lowest amount you could have given if you had taken the lowest on each item out of the entire four years—will you subtract 57.62 from 74.04 and tell us how far you came from the top?

A. 16.42.

Q. You were 16 cents under the maximum and 3.9 from the minimum?

A. Yes.

Q. And that is what you say you regard as normal?

A. I don't think I said that specially about the four year period.

Q. You put it in here and you expected us to accept it as worth something?

A. Yes, that was put in for the information of counsel and the court; personally I prefer the five year period.

Q. You don't think the four year average is fair?

A. Yes, but the other one is fairer.

Q. Would you go to a man and ask him to invest his money in this plant and tell him you had made up an operating cost that was within 3.9 of the minimum of each item for a period of five years and was sixteen cents and a fraction under the maximum, and tell him to rely on that?

A. It would show him what he could do.

Q. Would you ask a man to rely on that?

A. I don't know that I would.

3260 Q. You know you wouldn't?

A. I don't know that I wouldn't; I should advise him of the facts.

Q. He would want facts in a speculation like that?

A. He would get the facts.

Q. Take your next figures, 59.37 and tell me how much that is over the minimum?

A. 5.65 cents.

Q. How much is it under the maximum?

A. 14.67.

Q. We seem to get the worst of it again?

A. Yes.

Q. Now, then do you think that would give a fair result?

A. Yes, I think that is quite fair.

Q. Take 5.65 cents over the minimum and nearly 15 cents under the maximum?

A. I think that is about right, yes.

Q. Will you average the 74.04 and 53.72 and tell us what you get?

A. 63.88.

Q. Will you give us the average for the five years and tell us what that is?

A. 63.34.

Q. Looks as if it was pretty close to right?

A. Quite close.
Q. Looks as if it might be the fairest thing to take?
A. No, I don't think it would.
Q. Because it is not the lowest?
A. No.
Q. Now, then, take this 19.71 that I find at the top of page 9 and we get at that this way, don't we, we take 29.76 from page
3261 5 as the manufacturing cost for 1910, the lowest manufacturing cost?
A. Yes.
Q. Then we take 35.43 the additional operating cost of that year?
A. Yes.
Q. Add them?
A. Yes, get 65.19.
Q. Then we add 6 cents for depreciation?
A. Yes.
Q. That gives 71.19?
A. Yes.
Q. Then you subtract that from your 90.70 you computed as your average return taking into account the Valley Junction and you get 19.51?
A. Yes.
Q. Then making your correction for the city tax?
A. Yes, you get 19.71.
Q. Let us figure out 27.28 the same way; we start again with 29.76?
A. Yes.
Q. Then we take an average of the other operating expenses for the four years 28.77?
A. Yes.
Q. That gives us what?
A. 58.53.
Q. Then we add six cents to that for depreciation?
A. Yes.
Q. That gives us 64.53.
A. Yes.
Q. Subtract that from the 90.70 and we have what?
A. 26.17.
3262 Q. Then add .2 cents to adjust your tax, what do you get?
A. 26.37.
Q. That don't check?
A. No.
Q. What is the trouble?
A. The leakage explains it.
Q. If that was made up as you state it was it would check?
A. No, it wouldn't, if you accept those figures, but those are not exact figures to take; you have got to get back to another table.
Q. You didn't make that up the way your report says; you didn't base it on an average of four years?

A. Yes, I did.
Q. What is the average leakage for four years?
A. 2.26.
Q. What did you take as leakage?
A. Didn't take leakage at all that way; I took the actual leakage, 1.35.
Q. So you reduced your cost and increased your profit by taking instead of the average for the four years the lowest item of leakage in the five years?
A. Yes.
Q. It is a little misleading here, to say that is made up by taking the manufacturing cost of 1910, and the average distribution and other expenses for those four or five years?
A. No, it is quite clear to me.
Q. It isn't true as a matter of fact, is it?
A. I think it is.
Q. What is your average expense on account of leakage for the four years?
3263 A. 2.26.
Q. You didn't take that?
A. No.
Q. Is the statement that you did take the average for the four years true then?
A. I took the average actual expenses in dollars and cents for the four years, yes.
Q. Is this what they call juggling with figures?
A. No, it is not; it is not my business to juggle with figures.
Q. Won't you turn to page 19, the top of that page shows how you made up these various operating costs, don't it?
A. Yes.
Q. Now, then, begin with the actual of 1910?
A. Yes.
Q. You take each item just as it appears over on page 5?
A. Yes.
Q. Now, then, take number 1, that is supposed to be made up of the manufacturing cost of 1910 and the average cost of the four years ending December 31, 1909, isn't it?
A. Yes.
Q. Now, then, I will read from page 5. You have first there expenses of distribution, 5.52 on page 5?
A. Yes.
Q. Then you have next commercial expenses, 7.67 and that checks with page 19?
A. Yes.
Q. Then you have new business 3.98 and that checks?
A. Yes.
Q. General expenses 2.72 and that checks?
A. Yes.
3263½ Q. Taxes, 6.65 and that checks?
A. Yes.

Q. And you have on page 5 for this average leakage, 2.66 and that doesn't check?
A. No.
Q. You have taken 1.35 the low year?
A. Yes.
Q. Then you have miscellaneous credit, .03 and that checks?
A. Yes.
Q. Why didn't you take the leakage for 1910?
A. That is the actual existing condition in 1910.
Q. How would the existing condition in 1910 give you an average for four years?
A. I didn't take the average for four years; I took the actual for that.
Q. In other words of the two low items you took the actual?
A. You can put it that way.
Q. That is a fact; it is a matter of fact they are the lowest items?
—. ——.
Q. When you got to your next average you did not take the average for the five years of the other expenses besides manufacture, but you put in the 1910 leakage?
A. Yes.
Q. Still you thought yesterday I did not put in the 1910 tax because that would increase it?
A. I think you have them in.
Q. You did not take the 1910 tax, you took the average of the taxes?
A. They were the average, yes.
Q. That is under what the 1910 tax would be?
A. Yes.
Q. And we may very definitely assume that the taxes will never be less?
3264 A. I don't know.
Q. Your assumption is they will grow less?
A. They have been down in Des Moines; you pay less per thousand feet that you did in the old days.
Q. You don't misunderstand that?
A. On account of the increased business.
Q. That don't mean a decrease in taxes?
A. Not in dollars and cents per thousand.
Q. When you get down to brass tacks, your computation over here on page 9 are not based on what you say they are, or on anything that ever happened, are they?
A. Not based on anything ever happened?
Q. Not based on any actual condition or average actual condition?
A. They do not state——
Q. They are not based on any actual condition or average actual condition?
A. Yes, they are based on the average actual expenses for distribution.
Q. Take the whole thing?
A. Not as a whole, no.

Q. Wherever you distributed from the average you selected the low item?

A. It so happened, yes.

Q. It didn't happen, did it; you did not draw lots; it was not an accident, was it?

A. I don't know just exactly what you mean.

Q. You said it happened; I want to know whether it happened or whether it is the result of intelligent work?

A. It was the result of some intelligent work.

Q. I want you to tell the Master whether you believe that a conservative man would be justified in basing a conclusion
3265 as to the result of the operation of these works upon figures such as these?

A. Yes, otherwise they wouldn't have been there.

Q. You believe they are better than actual results, or the average of actual results, such as you took in Cedar Rapids?

A. I think they are best suited here, otherwise they would not have been in that report.

Q. Now, then, you remember that yesterday we found out that there was an abnormal condition as to oil here judging by the experience from the books?

A. Yes.

Q. And that was abnormally low?

A. Yes.

Q. You have taken that and put that into your computation?

A. Yes.

Q. Taken that abnormally low basis?

A. Yes.

Q. The leakage is abnormally low?

A. I don't know that it is abnormally low; or very high.

Q. What was the leakage in Cedar Rapids?

A. I haven't any idea.

Q. What is the leakage in Chicago?

A. I don't know.

Q. What is the leakage in Saginaw?

A. I don't know.

Q. What was the leakage in New York?

A. It was very small in New York; under two per cent, I think.

Q. If under two per cent is exceptionally low is not 1.35 exceptionally low?

A. Under two per cent.

3266 Q. Of what?

A. Of the gross business.

Q. They had a dollar rate?

A. Yes.

Q. That would be under two cents?

A. Yes.

Q. 1.35 would be abnormally lower?

A. It is a low leakage.

Q. You know what the leakage is anywhere except New York?

A. I do not.

Q. What is the leakage in Lincoln?

A. I do not attempt to carry them around with me at all.
Q. Have you asked Professor Marks about it?
A. I don't remember discussing the matter with him.
Q. So you don't know whether that leakage is abnormally high except you do know that 1.35 is abnormally low?
A. I say it is not high.
Q. You said two per cent in New York was abnormally low?
A. I remember New York was considered low leakage.
Q. You took this abnormally low leakage?
A. I think your leakage is about four per cent.
Q. You took 1.35?
A. Per thousand.
Q. That was on the ba-is of a dollar rate?
A. Yes.
Q. All these figures made up on page 5 are based on the dollar rate?
A. Yes.
Q. That would be 1.35 cents?
A. Yes.
Q. Or, 1.35 per cent.
3267 A. Yes; your leakage is not high, I will admit.
Q. Won't you admit it is abnormally low?
A. No; I wouldn't want to admit that.
Q. You will admit two cents in New York was abnormally low?
A. That is my recollection. I may be all wrong in my recollection.
Q. Referring to the paper marked Complainant's Exhibit 48, headed Des Moines Gas Company Average Gross and Net Return applicable to interest and profit four years ended December 31, 1909, I wish you would take this first item and look at your report and tell me whether I have got correctly the average sales there and whether the amount to be derived from the sales is correctly stated as $391,-943.47?
A. That is all right.
Q. Now, then, have you checked the entire exhibit?
A. Yes, sir.
Q. So that if we took the average of the four years ending December 31, 1909, and took your operating with the changes which you made in it, and depreciation figured on your basis, the net return applicable to interest and profits would average $96,053.61?
A. Yes, sir.
Q. And that includes Valley Junction?
A. Yes, sir.

Mr. GUERNSEY: I think we would like to have the record show that complainant offers and reads in evidence Exhibit 48 and asks the reporter to copy the same into the record.
Complainant's Exhibit 48 reads as follows:

3268 "Des Moines Gas Company.

Average Gross Revenue and Net Return Applicable to Interest and Profits for Four Years Ended December 31, 1909.

Revenue.

City of Des Moines:	
435,492,747 c. f. at 90¢ per M.	$391,943.47
Valley Junction:	
4,518,125 c. f. at $1.50 per M.	6,777.18
440,010,872 c. f.	398,720.65

Operating Expenses.

Exhibit "A" (hall)	$276,411.96	
Depreciation 6¢ per M. on 440,010,872 c. *g.*	26,400.65	
		302,812.61
Net earnings		95,908.04
Miscellaneous sales		145.57
Net return Applicable to interest & profits		$96,053.61
Excluding Valley Junction		92,385.80

3269 Q. Now referring to Complainant's Exhibit 49, I wish you would state whether that correctly shows what the average results would have been at 90 cents gas based upon the operating expenses as shown in your report for the four years ending December 21, 1909, excluding Valley Junction but taking your basis of depreciation?

Mr. BYERS: The figures below at the lower end of the first proposition on Exhibit 48, 440,010,872, what do those represent?

A. The average sales for four years.

Mr. GUERNSEY: That would be the totals for Des Moines and Valley Junction. Referring to Complainant's Exhibit 49, the figures are correct, are they not?

A. Yes.

Q. On the basis of taking out Valley Junction expenses at the same ratio as the Des Moines expenses that would show an average return applicable to interest and profits at the 90 cent rate with your basis of operation and depreciation at $92,385.80?

A. Yes.

Complainant offers and reads in evidence Complainant's Exhibit 49, as follows:

3270 "COMPLAINANT'S EXHIBIT 49.

Des Moines Gas Company Average Gross Revenue & Net Return Applicable to Interest & Profits for Four Years Ended December 31, 1909.

Excluding Valley Junction.

Revenue.

435,492,747 c. f. at 90¢ per M.		$391,943.47
Operating Expenses.		
Operating Expenses	$273,573.68	
Depreciation 6¢ per M on 435,492,747 c. f.	26,129.56	
		299,703.24
Net Earnings		92,240.23
Miscellaneous Sales		145.57
Net Return Applicable to Interest & Profits		92,285.80

3271 Q. Referring to Complainant's Exhibit 50, I wish you would look that exhibit over with a view to stating whether that does not correctly show the net return applicable to interest and profits for the five year period ending December 31, 1910, including Valley Junction and upon the basis of your figures as to operation and depreciation. Have you examined it?

A. Yes, that is right.

Q. You find it to be correct?

A. Yes.

Q. So that for the five years including Valley Junction the net return applicable to interest and profits on the basis of your operating expenses and depreciation would average $97,683.67 per annum?

A. Yes, sir.

Q. Now, then, turn to Exhibit 48 and we find that for the four years on the same basis it is $96,053.61?

A. Yes.

Q. That does not show a very abnormal condition as to five years or four years, does it; they are pretty close together?

A. They are, yes.

Q. It would not warrant the inference that there was something abnormal in either one of them?

A. I don't think that is the correct way to look at it myself.

Q. You think that difference would warrant the inference there was something abnormal there?

A. I don't think you wanted to draw any conclusion of that kind from this.

Complainant offers and reads into the record Exhibit 50, as follows:

3272 "COMPLAINANT'S EXHIBIT 50.

Des Moines Gas Company, Average Gross Revenue & Net Return Applicable to Interest and Profits for Five Years Ended December 31, 1910.

Revenue.

City of Des Moines	453,414,600 c. f. at 90¢ per M....		$408,073.14
Valley Junction	4,992,300 " " " $1.50 " "		7,488.48
Total.....	458,406,900 c. f.		415,561.62

Operating Expenses.

Exhibit "A" (Hall).....	$290,577.40	
Depreciation 6¢ per M. on 458,406,900 c. f.	27,504.41	
		318,081.81
Net Earnings		97,479.81
Miscellaneous Sales		203.86
Net Return Applicable to Interest and Profits		$97,683.67

3273 Q. I wish you would examine Complainant's Exhibit 51, which is a corresponding computation for the same five years, but excluding Valley Junction, and tell us whether that shows correctly the net return. Have you now examined Exhibit 51?

A. Yes.

Q. Do you find that to be correct?

A. Yes, subject to the Valley Junction expenses being excluded at the same ratio as Des Moines.

Q. So that shows, excluding Valley Junction, the average net return for the five years ending December 31, 1910, on a 90 cent rate and upon operating expenses and depreciation as shown in your report, $93,659.35?

A. Yes.

Q. And comparing that with Exhibit 49 which showed the same thing for the four year period, we find there is only a difference of twelve hundred and some odd dollars?

A. Yes.

Complainant offers and reads into the record Exhibit 51, as follows:

3274 "COMPLAINANT'S EXHIBIT 51.

Des Moines Gas Company.

Average Gross Revenue & Net Return Applicable to Interest & Profits for Five Years Ended December 31, 1910.

Excluding Valley Junction.

Revenue.

453,414,600 c. f. at 90c per M.....	$408,073.14

Operating Expenses.

Operating Expenses	$287,412.78	
Depreciation 6¢ per M. on 453,414,600 c. f.	27,204.87	
		314,617.65
Net Earnings		93,455.49
Miscellaneous Sales		203.86
Net Return		$93,659.35

3275 Q. Now it wouldn't be exactly fair for us on our side to take the average for four years or five years, as shown by these exhibits based on the average sales for that period, without also showing what the result would be taking the same operating expenses and depreciation for the sales of 1910, would it?

A. I don't just follow that.

(Question repeated.)

A. No.

Q. I wish you would examine Complainant's Exhibit 52, which states the return including Valley Junction at the 90 cent rate, based upon the operating expenses for five years, as stated by you and depreciation upon your basis, and state to us whether that is correct?

A. That is all right.

Q. You find that to be correct, do you not?

A. Yes.

Q. If you take the sales for 1910, including Valley Junction, on your basis of operating expenses and depreciation and the tax adjustment, the return would be $114,697.27?

A. Yes.

Q. Now that shows the difference between the basis which you adopted of selecting the lower expense items and combining them, and the basis of taking the average?

A. Yes.

Q. You got $145,173.06 on one method, and $135,863.22 on another method?

A. Yes.

Q. This is the result which we attain if we take an average of the five years instead of picking out small items?

A. Yes.

3276 Q. Now, then, I notice here we have put in a profit per thousand of 21.56 cents?

A. Yes.

Q. While you have a profit per thousand for the year 1910, the actual results of that year of 19.71?

A. Yes.

Q. On this 90 cent basis?

A. Yes.

Q. That difference between 21.56 and 19.71 would represent the deductions which you made from the actual amounts paid out by the company during this five year period?

A. I don't follow that.

(Question withdrawn.)

Q. Is this 19.71 based on the year 1910 alone, on page 9 of your report?

A. Yes.

Q. The fact that we have a profit of 21.56 for the average would indicate nothing as to that?

A. No.

Complainant offers and reads in evidence Exhibit 52, as follows:

3277 "COMPLAINANT'S EXHIBIT 52.

Des Moines Gas Company.

Profits on Basis of 90¢ Gas and Average Expenses for 5 Years.
(Including Valley Junction.)

Average Total Cost per M. for five years to December 31, 1910 (page 5—Hall)	63.34¢	
Depreciation	6.00	
	69.34	
Less Tax Adjustment	.20	
	69.14	
Receipts per M. (including Valley Junction) page 20	90.70	
Profit per M.	21.56	
Sales for 1910, including Valley Junction (Exhibit "C")		531,991,054 c. f.
531,991,054 c. f. at 21.56¢ =		$114,697.27

3278 Q. I wish you would also examine Exhibit 53.
A. The works is not included in this.
Q. Will you make the correction, if necessary?
A. It would give a result of $109,536.27.
Q. That difference is due to the fact that Exhibit 53 does not include the cubic feet 531,486,354?
A. Yes, sir.
Q. Will you please take the original Exhibit 53 and add below 521,486,354 the amount of the gas used at the works?
A. 3,615,6[illegible]
Q. Will you carry out opposite that the additional amount on account of that?
A. It is equivalent to 754.20.
Q. Will you draw a line under that and add it so as to give us 109,536.27 of Exhibit 53?
A. Yes.

Complainant offers in evidence Complainant's Exhibit 53, with the additions made to it by the witness, as follows:

3279 "COMPLAINANT'S EXHIBIT 53.

Des Moines Gas Company.

Profits on Basis of 90c. Gas and Average Expenses for 5 Years (Excluding Valley Junction).

Average Total Cost per M. for 5 years to December 31, 1910 (page 5—Hall)	63.34c.	
Depreciation	6.00	
	69.34	
Deduct Taxes Adjustment	.20	
	69.14	
Receipts per M (Excluding Valley Junction)	90.00	
Profit per M	20.86	
Sales for 1910, excluding Valley Junction (Exhibit "C")	521,486,354	c. f.
521,486,354 c. f. at 20.86c. =	$108,782.03	
Should be	109,536.27	

Gas used at the works 3,615,600 = 754.34

3280 Q. Now this makes a difference on account of Valley Junction of five thousand one hundred and some odd dollars; can't you give it to me exactly, comparing this exhibit with 52?
A. $5,161.
Q. You made your difference on account of Valley Junction .7 cent per thousand?
A. Yes.

Q. You indicate by your report and that is the inference to be drawn from your statement of 90.7 net per thousand?

A. Yes.

Q. How did you get at that .7 cent per thousand, that amounts to less than five thousand one hundred and some odd dollars?

A. Yes, that is profit on the Valley Junction and the difference in this used at the works.

Q. How did you get at your .7 cent?

A. The result of calculation, taking the Des Moines sales at 90 cents and the Valley Junction actual amount of gas used at the works at a dollar rate and divided the whole thing by 531,991.30 being the total sales.

Q. Did you in making that computation figure the gas used at a dollar?

A. I let it remain at your figure, being a dollar on both sides.

Q. Is that right?

A. The net result is the same.

Q. It would be the same as if you would put that in at 90 cents?

A. Yes, because I would put it in as expense 90 cents.

Q. I am talking about your income?

A. Put that at 90 cents, would be 90.66; there would be a difference there.

Q. The difference would be how much—you beat us a little there?

A. No.

3281 Q. Would the difference be twice as much as that adjustment on account of city tax .2 cent?

A. I don't know. I didn't beat you any; I took it in as an expense at a dollar and consequently there is no injustice to you.

Q. Your 90.7 is not on your theory, would be the actual income per thousand of gas sold, if the gas was all sold at 90 cents in Des Moines?

A. It is not.

Q. The actual income from that would be less?

A. Yes.

Q. I want to call your attention to Exhibit 54 and take up the items there that start with 63.34 found on page 5 of your report?

A. Yes.

Q. As the average operating costs for the five years as you adjusted them?

A. Yes.

Q. And the tax- per thousand for the year 1910 were 6.22?

A. 7.22.

Q. Yes, but for the average five years they were 6.78?

A. Yes.

Q. So that if we were to adjust your figures to cover the tax on the 1910 basis we should have to add .44 cent to your 63.34?

A. Yes.

Q. And then the depreciation you took out, six cents?

A. Yes.

Q. Now I have learned, and that you will have to assume for the present, as I will have to prove it later, to cover accident insurance,

covering as much as $7,500 for one person and $3,500 for one accident, but not covering additional matters, we would have to pay a rate amounting to two cents or 1.99 per thonsand. We
3282 have one accident that is referred to in your reports where the claims for the single accident amount to $125 or $130 thousand; so it would seem to me that would be a reasonable amount of insurance; at least reasonably low?

A. Two cents?

Q. The amount I am talking about, the amount covering the $7,500 maximum single injury, and $3,500 maximum for a single accident.

A. Yes, assuming this accident as a sample, it would be reasonable.

Q. You know ordinarily single accident claims run over $7,500?

A. They do not always get that.

Q. Now your Exhibit E shows the amount actually paid out; you gave us credit for on account of expenses as .38 cent?

A. Yes.

Q. So that if there was added enough to bring up and carry that accident insurance, if the cost I have given is correct, you would have to add 1.62 cents on that account?

A. Yes.

Q. We would have an additional expense as to bad debts, on account of there being no penalty in this new ordinance?

A. I won't concede that; I think you could take deposits and obviate the question of bad debt.

Q. Who suggested that to you?

A. That is not an uncommon thing.

Q. Who suggested that to you?

A. That was not suggested to me. It has been talked over since I was on the stand yesterday.

Q. With chom?

A. Professor Bemis.

Q. He gave you that as an answer?

A. No, I opened the question of deposits.

3283 Q. You asked him whether that wouldn't be an answer?

A. Yes, we discussed the question and we thought it was a good scheme—done as a matter of practice.

Q. Is there anything in the ordinance authorizing and requiring deposits?

A. No.

Q. Would you say that a half a cent a thousand was an unreasonable amount on account of extra expenses on account of collections and on account of the loss that necessarily occurs when bills are deferred?

A. I think you could obviate the charge.

Q. Obviate it entirely?

A. Almost entirely at least.

Q. On what experience do you base that?

A. It seems not unreasonable to me.

Q. I didn't ask you that.

A. It is my opinion, sir.

Q. Have you any experience as a basis for that opinion?

A. No.

Q. You know as a matter of fact, don't you, from your general knowledge, not referring to the gas business, where bills are not paid promptly, it costs more to collect them and the losses are greater?

A. In general business, yes.

Q. Now, then, this company has got to pay the expense of rate regulation, hasn't it?

A. Yes.

Q. There must be somewhere in the expense before you get to your net return applicable to interest and profits, provision for that?

A. I don't regard it that way. The question must be con-
3284 sidered before you can get a return on your investment. In other words, I would favor giving you a larger return to cover such risks as rate regulation.

Q. We have got, for instance, in the mere matter of making up the inventory an expense that amounts to one per cent on the gross sales, or more, and that is only the cost of the inventory, or a part of the cost of the inventory in this case. Now, then, this company must pay that?

A. Certainly.

Q. And it is a part of the expense of doing the business, isn't it?

A. No, I don't regard it so.

Q. What would you call it?

A. It is an extra expense.

Q. It is an expense?

A. Yes.

Q. Does the expense grow out of the transactions of the Company's business?

A. Indirectly, not directly.

Q. Is there anything more closely related to the Company's business than the rate it obtains?

A. No.

Q. This expense is directly related to that rate?

A. It is.

Q. It is then directly related to the business?

A. No, not as you state it. Its charge must be taken care of in fixing a return for you.

Q. What do you mean by return, isn't the return the profit after you pay your expenses?

A. Yes. To take care of this, additional allowance should be made. For example, six per cent is considered a reasonable
3285 return on your investment. I would not recommend keeping it down to six. I would recommend an extra per cent. I am not expressing any opinion.

Q. You know no man ever invested a dollar so far as you know, if you ever made examinations for people investing in properties like this, you know they never went in on that sort of a basis, don't you?

Objected to on part of defendants as incompetent, improper cross examination and mere argument.

A. I don't know anything about it.
Q. Somewhere we have got to take care of this expense?
A. Yes.
Q. I wish you would take the sales since our last rate controversy from 1896 down to 1910 and tell us roughly what they run?
A. Since 1895 your sales appear to be four billion ninety-seven thousand.
Q. Does that include Valley Junction?
A. Everything.
Q. It don't include 1911?
A. No.
Q. What was it in 1895?
A. Sixty-one million.
Q. Well, if we add say thirty-six or thirty-seven hundred million that would be approximately right?
A. Yes, about that.
Q. One cent on that would be thirty-six thousand dollars?
A. Yes.
Q. Now that would be, on that basis, an inadequate provision, as these cases are tried now?

Objected to on part of defendants as not being cross examination.

3286 A. I have no idea what your expenses are.
Q. But you know that anything like that ought to be spread over a term of years?

Same objection as last above made.

A. Yes.
Q. How many years, five or ten?
A. I think about ten years would be reasonable.
Q. Now, if you gave a cent and a half a thousand on the present basis, that would be about $7,500?
A. About that.
Q. It would leave for the ten years $75,000, if our sales increased, to take care of the entire expense of this litigation, including not only what is to take place before this time, but the subsequent hearings before the Master and this and other courts?
A. Yes.
Q. Do you say that would be too low an amount?
A. I don't know what your expenses are.
Q. You know the expenses of such a thing as this they run fairly high, decidedly high?
A. Sometimes they do.
Q. You wouldn't say a cent and a half a thousand would be too much on that account?

Same objection as last above made.

A. It has got to be provided for some time.
Q. You wouldn't say a cent and a half a thousand was an unreasonable provision?

A. I wouldn't care to express an opinion about a cent and a half.

Q. I didn't ask you to express an opinion. You wouldn't say a cent and a half a thousand would be too high, would you?

Same objection as last above made.

3287 A. Well, I will say it is too high.

Q. Who told you about that?

A. No one.

Q. And you say you have no experience upon which to predicate your judgment?

A. I would say, it comes in very largely as to whether or not you are entering on a gamble in the fight, if you are taking a forlorn hope.

Assuming you take up a fair fight, you are certainly entitled to an allowance.

Q. Do you think now that you ought to sit here and determine the cost of this litigation?

A. I am not attempting it.

Q. It would be a fair allowance on account of it on the assumption that the suit was brought in good faith?

A. I am not making any assumption at all.

Q. Assuming that the suit was brought in good faith, will you undertake to say that you believe a cent and a half is too high?

Objected to on part of defendants as not cross examination and immaterial.

A. No, I would not attempt to say it was too high.

Q. Now if the adjustments I have referred to shown on Exhibit 54 were made, that would bring the total cost per thousand up to 73.4 cents?

A. Yes, sir.

Q. Now so far as these adjustments are concerned there is not a single one of them that will not be a matter of expense to —. company, is there?

A. Ultimately that all will be expenses.

3288 Q. There is no doubt about that?

A. To a small extent.

Q. The only thing we could quarrel about would be the amount?

A. Yes.

Q. I wish you would look this over and see whether the computations based upon these adjustments are correct and what amount there would be net at the 90 cent rate, making these adjustments including Valley Junction?

A. You wish Valley Junction as you have it here?

Q. Yes, just as shown by this exhibit?

A. The result is $92,034.45.

Q. That is what the 1910 sales would give, net, taking your basis of cost and your basis of depreciation, and making the adjustments shown by this Exhibit?

A. Yes.

Q. And that includes Valley Junction?

A. Yes.

Complainant offers and reads in evidence Exhibit 54.

Objected to on part of defendants as incompetent, immaterial and based upon assumptions not in the record, and is no part of the cross examination of this witness.

Complainant's Exhibit 54 reads as follows:

3289 COMPLAINANT'S EXHIBIT 54.

Des Moines Gas Company.

Profits on Basis of 90¢. Gas and Adjusted Operating Expenses (Including Valley Junction.)

Average total cost per M. for 5 years to December 31, 1910 (page 5-Hall)		63.34¢
Taxes 1910 (page 5)	7.22	
" Aver. 5 years (page 5)	6.78	
Add to adjust taxes to 1910 basis		.44
Depreciation		6.00
Accident insurance	2.00	
Less amount actually paid (Exhibit "E")	.38	
Add to cover unsettled claim		1.62
Expense collection (no penalty)		.50
Rate regulation		1.50
Total cost per M. as adjusted		73.40
Receipts per M., including Valley Junction (page 20)		90.70
Profit per M.		17.30
Sales for 1910 including Valley Junction (Exhibit "C")		531,991,054 c. f.
531,991,054 c. f. at 17.30¢		$92,034.45

At this time, 12:- M. an adjournment was taken until 1:30 P. M.

3290 1:30 P. M., THURSDAY, *September* 14, 1911.

JAMES HALL continued on cross examination by N. T. Guernsey, Esq., testified as follows:

Q. Now Mr. Hall I want to call your attention to page 3104 of the record, on your direct examination you were asked this question and made this answer: "As I understand that proposition up to that point, the books of the company show and these figures are taken from the books by you and your men, that the net revenues at the present rate of gas for interest and other charges for 1910 was $192,107.65. A. Yes, sir." Then on the next page this question

was put to you "And it works out a net revenue available for interest and other charges of $104,884.98 or the equivalent to a return of 19.71 per thousand feet of gas sold. A. Yes, sir." Now it is not proper to compare that $192,107.65 with the $104,884.98 is it?

A. They are prepared on an entirely different basis.

Q. One has depreciation taken out and the other has not?

A. Exactly.

Q. This first item, $192,107.65 is not the net revenue at the present rate of gas for interest and other charges for 1910?

A. As shown by your record, but before excluding any depreciation.

Q. And that must be borne in mind otherwise this is misleading?

A. Oh yes, that has got to be borne in mind.

Q. Now there is this question and answer on page 3105 "I notice you state here that adopting results which you have adjusted and including depreciation gas at a sale price of 90 cents in Des Moines you have a net revenue available for interest and other charges of $145,173.06. Does that come in a later computation?

3291 A. Yes, it does. I might say I prepared computation on a basis of average operating expenses for four years preceding in order to determine the true working conditions of the company." Now that average operating expense for the four years preceding was not taken to get that $145,173.06?

A. The operating excluding manufacture.

Q. And taking low leakage that you found in 1910?

A. Yes.

Q. So that if we read this as it stands here it would be misleading?

A. It might be somewhat misleading.

Q. In other words we cannot accept the statement as exactly accurate without these modifications. Now you say again on page 3105 "Q. Now if you will, take up the fourth proposition and work that out for the Master explaining it to him as it appears on page 9. A. The table on page 9 is a statement showing the net return as previously determined on a basis of 90 cent gas assuming an actual expense for 1910. The second table is prepared on a basis of 90 cent gas assuming the manufacturing expenses for 1910 together with the average distribution expenses for four preceding years while the third table is on the basis of actual manufacturing expenses, plus the average distribution charges of five years to December 31, 1910." Now then there again that in order to be accurate should be subject to these modifications.

A. To the leakage modification, yes.

Q. You say as to the last matter referred to as on a basis of actual manufacturing expense. That should be modified to read actual manufacturing expense for 1910.

A. For 1910.

Q. I want to call your attention, Mr. Hall, to page 247 of

3292 the printed abstract in the supreme court of Iowa in the Cedar Rapids Gas Light Company against the city of Cedar Rapids, apparently the September Term 1908 which refers to and sets out a part of your report there as to the matter of leakage and I wish you

would refer to that and state what you reported the percent of leakage was in Cedar Rapids?

A. For the year 1902 8.58 per cent of the manufacture. For the year 1903 9.01 per cent of the manufacture. For the year 1904 11.22 per cent. For the year 1905 13.30 per cent. for the year 1906 12.81 per cent.

Q. The average is what?

A. 1.39 per cent.

Q. How much did that amount to per thousand?

A. 1902 3.30 cents; 1903, 3.08 cents; 1904, 5.36 cents; 1905 5.91 cents; 1906, 6.15 cents. Average 5.13 cents.

Q. You also stated there didn't you in that same connection that these percentages averaging 11 per cent and a fraction were excessive?

A. Yes, sir.

Q. Do you remember now whether you did consider this matter of l-akage in Cedar Rapids?

A. Must have if I made that statement.

Q. Now did you adjust that to what you thought a reasonable basis there?

A. I don't recall doing so.

Q. Just accepted the actual resul-s there?

A. As far as I recall. As I have already said I don't recall much about Cedar Rapids.

Q. Passing that for the present, I wish you would look over this Exhibit 55 and state whether or not on the assumption there
3293 made which are the same as those in Exhibit 54 except that Valley Junction is excluded the result attained is correct basing it on the average operating for five years and the gas sales of 1910.

A. On this basis the computation is correct.

Q. And that would give as the net return——

A. $87,166.92.

Mr. GUERNSEY: Complainant offers and reads in evidence Exhibit No. 55 as folows:

Objected to as incompetent, based upon assumptions that are not in the record, as no part of the cross examination of this witness and as immaterial.

COMPLAINANT'S EXHIBIT No. 55.

Des Moines Gas Company.

Profits on Basis of 90¢ Gas and Adjusted Operating Expenses (Excluding Valley Junction).

Average total cost per M. for 5 years to December 31, 1910 (Page 5—Hall)..		63.34¢
Taxes 1910 (Page 5).....	7.22	
" Average five years (Page 5).....	6.78	
Add to adjust taxes to 1910 basis.....		.44
Depreciation		6.00
Accident insurance.....	2.00	
Less amount actually paid (Exhibit "E")	.38	
Add to cover unsettled claims.....		1.62
Expense collection (No penalty).....		.50
Rate regulation.....		1.50
Total cost per M as adjusted.....		73.40
Receipts per M. excluding Valley Junction		90.00
Profit per M.....		16.60
Sales for 1910, excluding Valley Junction (Exhibit "C").....		525,101,954 C. F.
525,101,954 c. f. at 16.60¢.....		$87,166.92

3294 Q. Somewhere in your report you give a comparison of the depreciation each year. Can you tell me what page it is?

A. 17, at the bottom of page 17, the right hand column.

Q. There is a longer list than that here somewhere, it is on the next page 18.

A. It continues over.

Q. Now look at that, as a general proposition the per cent charged for depreciation on your theory grows smaller as we go further back?

A. Yes.

Q. And if instead of taking an arbitrary figure January 1, 1905 you had run as far as the books would show you and taken the cost and depreciated it, your value would have been larger than it is now would it not?

A. No, if I understand your question correctly.

Q. If you don't understand it I will be glad to make it clear or try to. Your per cent of depreciation runs smaller as you go back.

A. Yes.

Q. Because sales are very much smaller I suppose, that is the reason isn't it?

A. Yes, and relatively the plant investment is somewhat higher.

Q. If you had kept on going back from 1895 to 1886 the same condition would have prevailed wouldn't it?

A. Yes.

Q. And the amount that you charged off would have been relatively smaller as you went further back.

A. Yes.

Q. But instead of that you took an arbitrary figure for 1895?

A. Yes.

3295 Q. That would decrease your ultimate valuation wouldn't it?

A. The acceptance of this $429,000 in 1895 would tend to decrease the valuation, but on the other hand taking depreciation further back would help to equalize that increase at that time.

Q. At a smaller rate though?

A. Get smaller as the years went back.

Q. On page 9 near the bottom of the page you say that the investment amounts to $1,550,766.58?

A. Yes.

Q. Now of course that is not strictly correct.

A. That is the investment subject to the deduction for the depreciation.

Q. That is the amount upon which you have computed your various returns?

A. Yes.

Q. Do you think it is fair to charge off depreciation and to add no appreciation, if there is any?

A. It depends how you consider your appreciation. As I have explained in this report I think you are entitled to certain concessions in the way of appreciation, I don't know what they are that is a matter for you. I accept the figures as I find them on the books.

Q. You are figuring here a return on something?

A. Yes.

Q. Now that return is not on investment is it?

A. No, it may be more or may be less.

Q. You say here it is less don't you. You say you have computed the investment and have deducted about $250,000 from it.

A. Yes, that is investment shown by your books less that depreciation.

3296 Q. The amount on which you figure return is not the investment is it?

A. No.

Q. It also is not the value is it?

A. No.

Q. Now then what conculsions do you deduce from a computation that is based neither on the investment nor on the value?

A. That is your investment as shown by your books less that proportion which we estimate has expired.

Q. I asked you what conclusion you deduce from this computation of returns based neither on the investment nor on the value.

A. The conclusion stated here.

Q. What is that conclusion?

A. That there are certain percentages of return on that investment as stated.

Q. That is not return on the value is it?

A. No.

Q. It could not be accepted as indicating what return these same figures would give on the value?

A. Does not purport to do so.

Q. Now you have again left out an item that would have decreased the percentage of return haven't you?

A. I don't know.

Q. You don't know whether appreciation would decrease or increase the percentage?

A. Appreciation would decrease the percentage.

Q. Yes, I thought it would. Now at whose suggestion did you omit that?

A. The matter was never discussed.

Q. Take this table at the top of page 9 it shows a return or valuation upon which some figures would give a return of five per
3297 cent and so on?

A. Yes.

Q. Now there is nothing in your report by which the Master could get at what the actual value of the plant was so as to utilize that table at the top of page 9?

A. I do not purport to show the Master the value of the plant.

Q. You referred to this Chicago ordinance and to the action under it with reference to some items. That ordinance provided for the rehabilitation of the property and the expenditure of some money?

A. Yes.

Q. How much did that ordinance provide should be added for contractor's profit?

A. Ten per cent.

Q. How much did it provide should be added for overhead charges?

A. Five per cent on 110 per cent. At least it has been interpreted as five per cent on 110 per cent. There was a doubt in the ordinance.

Q. How much did it say should be added on account of discount on securities?

A. Nothing.

Q. Are you right about that?

A. Absolutely.

Q. Were the bonds to be sold at par?

A. The five per cent was to provide for any discount on securities.

Q. That was to provide for discount on securities.

A. Yes.

Q. How much did it provide for engineering and contingencies like that?

3298 A. The ten per cent and five were the only provisions in the ordinance.

Q. Now you applied that ordinance to us on these donations, did you give us the benefit of fifteen per cent?

A. I added nothing to your books.

Q. Before I forget it, there is one item I want to ask you to get some information about and I will ask you now. You itemized this cost more or less somewhere, here it is on page 21? You have real estate $35,765.26 at that time. Now I wish you would get me the specific pieces of real estate that that covers.

A. All right.

Q. In getting at this $1,550,766.58 how much gave you put in on account of discount on securities or expense of selling bonds.

A. Nothing.

Q. The books showed that expense didn't they?

A. Yes.

Q. And that is a legitimate expense isn't it?

A. Quite.

Q. Why did you ignore it?

A. That is an expense to be considered by the stockholder and not in my opinion one to be considered in litigation with the consumer, that is a question of finance.

Q. Then when you made up this account here you did not take the actual cost?

A. If you consider that an item of cost no I did not.

Q. Well it is isn't it?

A. Not in this connection.

Q. Well but a thing costs so much don't it?

A. Yes, sir.

Q. And the point of view from which you look at it don't
3299 change these figures?

A. It doesn't cha-ge the figures, but changes the way of measuring it.

Q. As a matter of fact the company did spend some money on this account didn't it?

A. Yes.

Q. How much did it spend on this account?

A. $40,000 altogether including reorganization expenses or $33,750 I think for bond discount.

Q. Those were actual expenses incurred?

A. Yes.

Q. They were legitimate expenses so far as you know?

A. Yes.

Q. And were part of the investment?

A. Of the stockholder, yes.

Q. Now then on what theory is that money to be treated differently from other money?

A. That is a matter for the finance of the stockholder himself not a matter to be treated in connection with the consumer.

Q. That don't answer my question, I want to know why that item of expense is not as legitimate a part of the actual cost of this plant as any other item of expense?

A. I have just answered.

Q. You have said you did not consider it but you have not said why.

A. I will explain a little further, if you had sold six per cent bonds you would have sold them at par, but there would have been a heavier charge against your profits in respect to that issue of bonds. Instead of that you put them out at five and should absorb the discount over the rate on the bonds. That is another matter for the stockholder himself being a finance matter.

3300 Q. The stock holder in your very wide eperience has evi*d*ced something like this disposition, what he wanted to know was how much money it was going to cost him?

A. Yes, sir.

Q. Now he didn't care what that money went for, he wanted to know thoug*h*t how much he had to put up?

A. Yes, sir.

Q. Then he wanted to know how much the company could return on it.

A. Yes.

Q. Now you check out $40,000 you say and don't allow him any return on that?

A. No, I do not. I would not interpret it that way.

Q. Why does your report contain this so called book value of the plant less depreciation, what you call the actual value of the plant?

A. Simply as a guide to the court as to money invested in this plant.

Q. And for what purpose would the court want to know anything about that for?

A. To determine what is a reasonable rate in this suit.

Q. You omit an item of $40,000 or $50,000 that has actually gone in?

A. And so state.

Q. Because on your theory it don't earn a return?

A. Not quite so.

Q. Now were there any other items omitted in the same way?

A. No, that item and $120,000 paid to the United Gas Improvement Company in respect of the debt due by the Capital City were the *the* only two items omitted from your account that I recall.

Q. You did omit practically all that $200,000 paid for patents and——

3301 A. I excluded $172,000 of that, yes.

Q. Now that is not on the investment theory is it?

A. No.

Q. They made that investment?

A. They presumably made that investment, yes.

Q. You exclude it because the value was not there?

A. No, I exclude it because I commenced business with the affidavit by Col. Pratt. I accepted his affidavit as being what was left here in this plant.

Q. If you went back of that affidavit you would have included this investment?

A. On Mr. Hagenah's report I would have to include another $40,000.

Q. If you went back of this item and adhered to your investment basis you would have included that wouldn't you?

A. Yes, in all probability I would.

Q. And that would increase your book value?

A. Yes.

Q. Have you any idea what the value of this plant is?

A. None.

Q. Not the remotest?

A. Not the very slightest.

Q. Now you charge up on page 12 some repairs and say at the bottom of page 11 in producing this it might be mentioned that during the year 1910 extensive repairs were made at the works stated in dollars and cents the repairs during the period under review were as follows, and then you explain them. Now there is nothing improper in those repairs is there?

A. No, I am not making the suggestion.

Q. It was bound to be necessary to make those repairs some time?

A. You have got to repair your plant some time.

3302 Q. The company had to pay for them some time?

A. Certainly.

Q. And the fair way for you in order to get at general results would be to average them over a number of years?

A. Your repairs you have to average the same as others.

Q. And five years is the standard is it?

A. Not always.

Q. Well it was the standard time in the Cedar Rapids case wasn't it?

A. Yes, sir.

Q. And it was as you stated there, it had been adopted as standard?

A. It is very often considered as the standard, but it may not always be adopted.

Q. I don't mean always adopted, there is nothing that is always done that I know of. To get any fair average on repairs it is just as necessary to take in a big year as it is a small year isn't it?

A. Certainly to get a fair average.

Q. Now you had also some repairs mains and repairs services referred to on page 13 that were high, is that right?

A. Yes.

Q. The reason for that was obvious wasn't it?

A. Quite.

Q. That is the city had been changing grades of streets?

A. Yes.

Q. And the company to conform to these grades had to change its mains and incur expense that it would not occur every year but would incur occasionally?

A. Naturally.

Q. And a change in the mains involved a change in the services?

3303 A. Exactly.

Q. That is something that you have to pay some time?

A. Yes.

Q. And to get a fair average these items ought to be spread over a number of years?

A. Yes.

Q. Now you say the increased advertising expense of 1910 appears to be due to the inclusion of larger charges by the United Gas Improvement Company at Philadelphia in respect to advertising services rendered. I wish you would be a little more specific about that and tell us just what it is.

A. I can't give you any more detail now, I can get it for you.

Q. Do you know anything about it?

A. I know larger advertising was paid to the United Gas Improvement Company, that is all I know about it.

Q. Who told you that?

A. My assistants.

Q. You don't know on what account they were paid?

A. I was not particularly interested. In connection with advertising in some shape or manner.

Q. You call attention to this here and it is the only item there with reference to advertising to which you call attention.

A. Yes.

Q. You had some reason for it why you emphasize it in that way.

A. Because it was considerably larger, that is why I call attention to it.

Q. How large was it?

A. .59 in 1910.

Q. Was that the increase?

A. No, that was the actual figure.

3304 Q. What was the increase you call attention to here?

A. The increase was over the average .21.

Q. That would be about how much?

A. About $1,100.

Q. What was that paid for?

A. I don't know.

Q. Do you know anything about this except what somebody told you?

A. No, I don't except it is increased to this extent.

Q. How do you know that, did you look the books up?

A. No.

Q. That was just what somebody told you?

A. Yes.

Q. As far as you know the company made money by spending that $1,100?

A. I don't know anything about it.

Q. And it was an entirely legitimate expense as far as you know?

A. I am not objecting to it.

Q. Not in the slightest degree?

A. Never raised any objections to it.

Q. You say increased soliciting expense is explained by largely

increased salaries in 1909 and 1910? What is just the force of that word largely in there, what was the increase?

A. I don't recall.

Q. Did you ever know?

A. Yes, I looked over the schedule of the salaries and general increase in the way of salaries.

Q. Did you pick out the solicitors salaries and find out what that increase was?

A. And increase force is my recollection.

Q. All I know is by what you say, I don't know what you think or recollect, you say the increased soliciting expense is ex-
3305 plained by largely increased salaries in 1909 and 1910. Now did you use that word largely without some reason?

A. No, I don't presume I did.

Q. Have you any information on the subject?

A. Yes, we have some information on the subject.

Q. I don't like that we, I am asking about you.

A. Well I have.

Q. Based on your own investigation?

A. The summary prepared of these ac-ounts.

Q. Where is it?

A. In the working papers; I can get it for you tomorrow.

Q. Have you any idea what that increase was?

A. I don't recollect now.

Q. You would no- suggest then it was improper?

A. I have not suggested it.

Q. Why did you call attention to it?

A. To explain the increase in the expense.

Q. That is all you know about it as a matter of fact?

A. Yes.

Q. Now then I want to take up this expense extra for a minute. These expenses are usual are they not with corporations such as this one?

A. Yes.

Q. They are usual with business men generally?

A. To a greater or lesser extent, yes.

Q. Well people usually try to keep them down as low as they can don't they like any other expense item?

A. They certainly do.

Q. But they are incurred simply because people believe generally that it is worth while from a business point of view to do it?

A. Not always. You give them very often because you are
3306 importuned to give them.

Q. And because you think it would be bad policy to refuse?

A. Not always, no.

Q. Do you mean to say that these expenses are illegitimate?

A. I didn't say so.

Q. Do you mean to be so understood?

A. No.

Q. They are expenses ordinary with corporations on this character and bysiness corporations generally?

A. They are with business corporations generally, but not so much with corporations of this character.

Q. You know the classification of the Inter State Commerce Commission prepared for railroads covers items of this kind?

A. Yes, sir.

Q. They recognize them?

A. Yes, sir.

Q. You know every commission classification for public utilities recognizes the propriety of items of this kind?

A. Yes.

Q. Do you know of any classification that does not?

A. Yes.

Q. What?

A. Not classification exactly but the comptroller of the city of Chicago.

Q. I asked for classification?

A. No classification, no.

Q. So generally every classification you know of whether public or private recognizes them as part of the legitimate expense doing this?

3307 A. Yes.

Q. You will not say that is not sound will you?

A. Well I think there might be reasonable doubt about it.

Q. That would be putting your opinion against the recognized principles everywhere so far as you know except in Chicago wouldn't it?

A. It is not the general practice to exclude them, but I think there is a very good reason for excluding them.

Q. You take this association and these transactions that are directed towards building up the city of Des Moines, the business — of Des Moines contribute to it simply because they think it is to their interest to built up the city. Don't you think the interest of the gas company is identical with theirs?

A. It is identical with the city of Des Moines.

Q. It is identical with the interests of the business men who think they can help in building up the city.

A. Yes, the business men pay subscriptions themselves and also you to pay yours, that is the fair way to look at it.

Q. Then if they are assisting us to pay ours I can say I am assisting them to pay theirs.

A. Yes.

Q. So it is six of one and half a dozen of the other isn't it?

A. Well I don't know but it is.

Q. You know it is not exactly legitimate is it for me for instance to say if a man pays me a fee he is assisting me in buying cigars?

A. It certainly assists you to buy the cigars.

Q. If I d[illegible]n't earn any fees I perhaps could not buy cigars, but the man th[illegible] pays me pays me not with reference to what I am going to do with the money?

3308 A. Pays you for your brains.

Q. Or with reference to the service I render to him?

A. Certainly.

Q. If by contirbuting to these things the gas company can help build up the city and so help build up the business of the gas company and in that way produce this condition that is going to decrease expenses and enable them to some time reduce the price of gas, why isn't the public just as much interested as anybody else?

A. I am not arguing with you about it, I have no particular objections on the subject one way or the other.

Q. You don't know whether this ought to be included or not?

A. I do know, I simply state the fact of what happens in Chicago. I think the best proof of the matter is I left them there.

Q. You have referred to one public utility in Chicago, there are others aren't there?

A. That applies to all public utilities connected with the city of Chicago.

Q. Name them.

A. Refers to all traction companies and the telephone company.

Q. Now the other companies?

A. That remains to be seen yet.

Q. Now then *you* call your attention to these salaries general. Do you mean to say that these items are not proper?

A. I never made the suggestion.

Q. Then you do not criticise them, do not say they are improper?

A. It seems to me it is a matter of proof if you get the services rendered.

Q. That is all there is isn't it?

A. All there is to it.

3309 Q. If we have a purchasing agent and by reason of that purchasing agent and by reason of his connection with the U. G. I. company are able to buy lower than other concerns, then the Des Moines Gas Co. gets a benefit?

A. If you can show where you get any benefit from the salaries paid it would be a legitimate expense of your business.

Q. Do you throw out all salaries unless it is affirmatively shown there is benefit commensurate with the salary?

A. I think quite reasonable to do so.

Q. What investigation did you make. The fact is it is the reverse as to salaries and you accept salaries un-ess there is something to indicate they are not earned?

A. Yes.

Q. In this same connection, what is oil selling for now?

A. 2.8 cents according to your contract.

Q. I don't mean that, what is it selling for in the market?

A. I don't know.

Q. What did it sell for last year in the market?

A. I don't kno-.

Q. What is any company aside from this company paying for it?

A. I don't know.

Q. What has any company aside from this company ever paid for it?

A. I have no idea.

Q. Well didn't you yesterday rather intimate that our price of oil was high?

A. I intimated that I had—my general impression was that there was a much larger cut in the price of oil than there was, than according to your records there was, that is all.

Q. Where did you get that information?

A. That is what I have been trying to think out myself. I got that impression some very considerable time ago.

3310 Q. Didn't Prof. Marks tell you?

A. He did not.

Q. Prof. Bemis?

A. No he did not. The matter has not been discussed with Prof. Bemis or Prof. Marks.

Q. You don't know as a matter of fact that this price for oil is low?

A. I don't know, no, except as I say I received the general impressio*j* some very considerable time ago that oil had been cut in two.

Q. How long ago?

A. Quite some months ago, about a year ago.

Q. Do you think it is of any value to this company to have available what funds it needs from time to time for extensions and things like that?

A. To a certain extent yes.

Q. What do you mean by your limitation to a certain extent?

A. I would regard it rather poor business to carry an exceptional cash balance when you have the bonds you can sell, when you *ha* have bonds in the treasurery available for sale any time when required.

Q. You apparently do not understand the question, what I want to know is whether it is worth something to a public utility in Iowa to have somebody that will take its securities and advance it money when it needs it.

A. Oh yes, that is useful at all times.

Q. Can't always sell your securities at a good price can you?

A. Some trouble some times.

Q. If we are going to adopt your theory and won't allow
3311 anything for discount on bonds that is a pretty serious thing?

A. I did not suggest that theory to you.

Q. You throw it out of your valuation?

A. I don't think you understand. That theory was not advanced,

Q. Now then do you think it is worth anything to this company to have its books audited and its accounts audited periodically by competent people?

A. It should be yes.

Q. You charge for doing that work don't you?

A. We certainly do.

Q. And you think it is worth the money?

A. We regard it as being worth the money.

Q. Do you think it is worth anything to this company to have the engineering experiences and the engineering force of the U. G. I. Company at its disposal?

A. It should be yes.

Q. It would cost a good deal if they tried to buy it from somebody else?

A. Cost some money I expect.

Q. You say on page 18 as explained on page 8 of this report the distribution and other expenses of the year 1910 cannot be regarded as indicative of normal operating conditions. To obtain a reasonable estimate of the net revenue operating under normal conditions and including sales at 90 cents per thousand cubic feet and an allowance for depreciation we have decided to accept the average expense of operating for two years as follows, A, four years ended December 31, 1909, B, five years ended December 31, 1910. That is followed by your statement on page 19 which is the one that I referred to before, it is not made up on the basis stated is it?

3312 A. Yes I regard that as being made *up* on the basis stated.

Q. You state the basis here as the average for these two periods *an* and do not say anything at all about taking the 1910 manufacturing at the bottom of page 18.

A. Well I am quite content to modify it as to manufacture.

Q. So if a person reading this accepted it it would be misleading?

A. No, I think if he read the report as a whole it would not be misleading.

Q. If he took*d* the report as a whole and checked out the figures and found out where were the differences but without doing that if he read the statement as you have it here it would be misleading wouldn't it?

A. I hardly think so.

Q. You think by intuition he would make these corrections?

A. I think he would if he read the report as a whole he would follow it all right.

Q. Now you carry that on, you say on page 19 the following is a summary of these results and comparison of actual results giving 1910 actual and then the average of four years and the average of five years except you have 1910 manufa*fruting* and 1910 leakage?

A. Yes.

Q. And you go on down at the bottom of the page and carry that same thing through, say under operating expenses manufacturing year 1910 actual so and so, distribution other expenses the sales so many thousand feet, without anywhere calling attention to the fact that you did not make this up in the way in which the report states it is made up, isn't that true?

3313 A. I hardly agree with your conclusion.

Q. Well point out the place where you do call attention in your report to the fact that these statements are not made up as stated?

A. The report and statements taken together I think are perfectly clear.

Q. Find me the statement here. Of course we figured it out by making these computations, spent three or four hours on it. Show me a statement giving it without taking the figures?

A. There is no statement such as you mention.

Q. Do you remember now whether there were surrounding towns at Cedar Rapids that were involved in the case there?

A. There was one town.

Q. And do you remember whether the gas sales there were eliminated by you?

A. I do not. I don't recall.

Q. Now let me call your attention to this from the testimony in the Cedar Rapids case, the transcript filed in the supreme court page 1368. "Q. Now you heard Mr. Dutton's testimony yesterday with regard to Exhibit K-2 containing a schedule with reference to gas sold for 1907 for the months April to August inclusive. You have included the sales at Marion in your statement, don't you? A. Yes." Do you remember that, do you remember whether you included Marion sales?

A. I will accept that as being a record of the proceedings.

Q. Did you proceed as follows: Q. Now have you prepared a schedule showing what difference it would make in the final result which you have reached as shown on page 29 of Exhibit K-2. A. Yes."

A. What is Exhibit K-2?

Q. That is your report I think. Now do you remember that you did there when your attention was called to it
3314 after you had gone through and testified make a computation eliminating the outside town?

A. I do not. I am quite prepared to accept the record on the subject.

Q. Do you remember there whether the price of gas in the outside towns was the same as in Cedar Rapids?

A. I have no recollection.

Q. As a matter of fact Valley Junction ought to be eliminated becaue it would not be fair to increase rates in Des Moines and hold Valley Junction down or decrease them here and hold them up would it?

A. Not attempting to do so.

Q. I didn't ask whether you attempted to do so or not, I assume you did not make the rates, I asked whether it would be the right thing to do?

A. It would not. But if you will permit me to point out if you take out sales and expenses of Valley Junction and take out a corresponding amount out of the capital the amount will be just about where you started.

Q. We have not put any capital into our estimate.

A. In my estimate $45,000.

Q. How can you say it affects it where you say you have nothing to do with the value of the property?

A. It shows what you paid for the property.
Q. No, it don't even show that.
A. Shows actually expended going into the property charged to that account by the original affidavit.
Q. It shows this when we get down to brass tacks it shows what you say is Mr. Pratt's appraisement, it shows then what you
3315 say is cash paid in less some 40 odd thousand dollars on account of discount on securities and less about $250,000 depreciation that is what it shows instead of actual cost isn't it?
A. Yes.
Q. Now I would like to turn *go* your computation for the working capital for a minute. What page is that on?
A. 25.
Q. What do you mean by working capital?
A. The amount of available free working assets necessary to operate business.
Q. In other words this company sells gas on credit?
A. Yes.
Q. It has to buy the material and to pay the cost of manufacture?
A. Yes.
Q. It necessarily has to carry some cash, does it discount its bills?
A. I can't say whether it does or not. I think they pay thirty days.
Q. You don't know whether they discount bills or not?
A. I could not say.
Q. That would be something for which working capital would be necessary?
A. Yes.
Q. These things all mean that the concern after it has its plant or property must have some money on top of that to do business on?
A. Yes.
Q. It buys and carries supplies on hand?
A. Yes.
Q. It is important it should have supplies on hand isn't it?
A. Yes.
3316 Q. Especially where it is shipped in from a distance like oil and coke?
A. Yes.
Q. So that there shall be no interruption of the business of the company on account of the failure of these things?
A. Should not be.
Q. Now you took then as their material and supplies on hand what you found at that time to be $77,410.46. Now will you turn over to your Exhibit "F" and tell us what they carried on hand on March 1, 1906?
A. $128,790.72.
Q. And on 1907?
A. $127,499.30.
Q. And 1908?

A. $122,789.49.
Q. And 1909?
A. $97,319.28.
Q. The items you are reading are found under the head assets subhead material and supplies.
A. Yes.
Q. And as of what date did you take this?
A. December 31, 1910.
Q. What did they have at that time?
A. $73,929.26.
Q. Don't check does it?
A. Yes, gas arc lamps underneath $3,481.20.
Q. That is what makes it check?
A. Yes, gas arc lamps.
Q. So you took the lowest figure at that time that there was in the five years?
3317 A. It took the balance sheet of December 31, 1910, that was the date I was working at. It so happened it was the lowest.
Q. That happens in every distance don't it where there has been any selection of figures?
A. It has happened once or twice.
Q. Please give us an instance where it has not happened where there has been any discretion exercised in making a selection of figures in your report?
A. I don't know that I can.
Q. Isn't it a fact that wherever in your report where you had some discretion you have selected the low item?
A. The question of discretion did not come into it at all.
Q. No question of discretion involved in your report?
A. Was not a question of discretion involved in this.
Q. Then you took the accounts receivable, that is something that your working capital goes into?
A. Yes.
Q. What makes up these accounts receivable?
A. The accounts current gas accounts, gas sold those in arrears, city of Des Moines, Welsbach street lighting Co. and residual appliances and sundry accounts.
Q. So they are all current accounts growing out of the business.
A. Yes.
Q. You put also in here your cash on hand?
A. Yes.
Q. And then your insurance paid in advance?
A. Yes.
Q. So that as a matter of fact at this time the company has invested in surr-nt and working assets $179,608.35?
A. Less the deduction?
3318 Q. Well but didn't it have this investment at this time?
A. Yes.
Q. Without any deduction?

A. I had the investment, current working assets, yes.

Q. Now then you cut that down by deducting two things, one is bills and accounts payable?

A. Yes.

Q. If those bills and accounts payable are for additions made to the plant during the year not funded into bonds they ought not to be deducted ought they?

A. That would depend to some extent. I would not be prepared to give you a straight answer on that. Under certain conditions, yes.

Q. On what conditions, just what conditions?

A. If you had built the plant entirely and notes payable, long time notes I would say you are quite right. In a case of this kind accepting the balance sheet as your basis I would say no, on this balance sheet.

Q. The result would be this, you have got the so called book value of the plant and you give us some working capital here and on the assumption I have made you would deduct $51,000 that had gone into the plant that you do not show anywhere in your book value?

A. No, I would not. I would give you the book value of your plant exactly as shown by your books subject to that original affidavit.

Q. And subject to depreciation and subject to cutting out bond discount?

A. Yes.

3319 Q. Now if that $51,837.00 had gone into the plant we are entitled to it somewhere aren't we?

A. You have got it.

Q. I say we are entitled to it.

A. Yes, you are entitled to it and you have it.

Q. Now then would it appear in your $1,450,000?

A. $1,550,000, yes.

Q. Now you deduct your accrued taxes and interest?

A. Yes.

Q. You stated that there is doubt about that and you resolve the doubt against again didn't you?

A. No.

Q. You say this, we believe the suggestion has been made taxes and interest should not be deducted in determining the amount of working capital but because of their non payment the amount of cash on hand is correspondingly increased?

A. That is so.

Q. So there is doubt about that?

A. No doubt in my mind.

Q. It is a mooted question?

A. Might be a question about it, yes, open to argument.

Q. You resolved that against us?

A. Resolved it against you because in the adjustment it should be.

Q. Resolved it against us?

A. Yes.

Q. We seem to have hard luck don't we?
A. You certainly have.
Q. Don't seem to win any of these mooted things. Now suppose this company had started out in business and take up that accrued taxes and interest a minute. It had not been operating and
3320 taxes and interest had accrued where would it get the money to pay them?
A. Issue of bonds presumably or issue of stock.
Q. Or borrow it?
A. Or borrow.
Q. It would need that much working capital wouldn't it?
A. Yes.
Q. Would you deduct it from the working capital under those circumstances?
A. Conditions are not parallel.
Q. I didn't ask you that I asked you whether you would deduct it under *whose* conditions.
A. Under those circumstances I would determine the whole thing on a different basis.
Q. Under those circumstances would you deduct it?
A. Not on the conditions you state no.
Q. You would not deduct it because we would need that much working capital to pay these bills.
A. Yes.
Q. Now then we need just that much to pay bills as of the date of your statement here don't they?
A. Yes, from your funds you get from the collection of your accounts receivable.
Q. We get all our funds from that.
A. Yes, I know but for those particular bills you collect before the 10th or the 15th of the month to get these accounts.
Q. All of our working capital must come from somewhere?
A. It must.
Q. You determine then whether it is working capital or not by the source from which we get the money?
3321 A. Not altogether.
Q. If we had borrowed this money and had it on hand and were using it for this purpose you would call it working capital wouldn't you?
A. Yes.
Q. But because we happened to not borrow it but have applied it here and taken it out of the earnings instead of distributing them in dividends you say it is not working capital, is that it?
A. That seems about it, yes.
Q. So the smart thing for us to do would be for us to distribute that for dividends and then borrow the money?
A. The- it would show you had that much more invested in the plant, you would have yes.
Q. But would we have any more money or any more property than we have got now?
A. You might not no.

Q. Did you have a conference with Mr. Marks about this working capital?

A. The thing was casually mentioned one night.

Q. You both happened to get it just the same didn't you or within a very few hundred dollars.

A. It so happened I believe.

Q. That was pure accident?

A. It was. I might explain to you the subject was not discussed until we had both prepared figures.

Q. You were keeping close enough in touch with Prof. Marks to know when he prepared his figures?

A. I know when he came in here on the stand the matter was *talled* one night after he started to give evidence.

3322 Q. This company with a working capital of $68,000 on your theory has got current assets here of $179,000?

A. Yes.

Q. And you give them credit on account of these assets for only $68,952.

A. Yes.

Q. But if it had borrowed money instead of saving it out of its earnings you would give them credit for the whole amount?

A. It would have altered the position certainly.

COURT: Let me understand that. You mean to say that you give them credit on the value of the plant or investment when they borrowed money to pay interest?

A. If they issued some more bonds it would increase their cash balance.

COURT: Don't you put interest in the same category you do dividends.

A. I do.

COURT: Not part of the expenses?

A. Not part of the expenses of the business.

Q. Now as a matter of fact these accrued taxes and interest that you put down here is a mere book entry isn't it?

A. It is.

Q. It is not something that has been paid out?

A. It has not.

Q. But you are holding the working capital in order to pay it.

A. Yes.

Q. That is what we are going to use the working capital for.

A. Yes.

Q. So you say you have not got that working capital?

A. You have if you would take a ba-*nace* sheet the same date and you have the cash and the liabilities against it, it would be

3323 substantially the same as this.

Q. But we haven't got cash here?

A. Got substantialy cash to pay it.

Q. Got $49,434.15, we are goijg to use that to apply on bills and accounts payable?

A. Yes.

Q. We haven't any cash to apply on accrued taxes and interest?

A. You will be collecting some accounts receivable to pay that.

Q. Then you are deducting it from something we are going to collect in the future.

A. Collect ten days after the first of the month most of it.

Q. What I want to get at is this theory on which you take out of the working capital we actually have, the amount of some accrued expenses we are afterwards going to pay out of it. If we were going to pay off some actual cost of manufacture you would deduct that? In other words you do not give us the actual working capital but take working capital and then deduct from that what you can find that you think we are going to apply it on?

A. On the result I consider *I consider* working capital.

Q. You only give us credit for the balance?

A. Yes. If it happened that we paid these bills and accounts payable, if they were capital accounts paid them out of bonds then that won't be deducted because we are not going to pay them out of working capital.

A. There are conditions where that would apply, yes.

Q. If we are going to pay accrued taxes and interest out of something, going to be collected hereafter, then that ought not to be deducted?

A. No, I don't agree with you there.

Q. As a matter of fact the amount of working capital we
3324 actually have there is $179,608.33.

A. I don't agree with that conclusion either.

Q. We have that much invested actually in supplies, accounts cash in the bank and insurance paid in advance.

A. Yes, I think your theory is subject to grave abuse however.

Q. I don't know anything about that. I am just trying to get at——

A. I am just offering the suggestion, that is all.

Mr. Byers: It might be entertaining to have him enlarge on that subject?

Mr. Guernsey: All right go ahead.

A. You can imagine a condition where a company would buy very expensive material and supplies far beyond any requirement, and then you would claim a return that you would not be entitled to. You may have materials and supplies to go ahead for a year or a couple of years and then include it as capital.

Q. That would not be a very wise course?

A. I am simply offering the suggestion the theory is liable to be abused.

Q. When you check up material on hand here it shows less on hand than any time the last five years.

A. That shows good and careful management.

Q. That is like some of these other things, it don't apply to this case?

A. I am simply offering it to you is all.

Q. Then to get back we have actually invested $179,608.35 of working capital?

A. On your theory, yes.

Q. I don't care what the *chtory* it, that is the amount of investment?

A. Subject to these deductions, yes.

3325 Q. The deductions don't affect the aggregate amount of this investment, the aggregate of the things in which working capital was invested was $179,608.35.

A. Yes, I will accept that.

Q. The way you get at your proposition is by deducting from the actual invested working capital some of these obligations which you think it will be used to pay?

A. Yes.

Q. Where as a matter of fact there is not enough money to pay half of them so it is obvious it cannot be used to pay even one half of these obligations.

A. I think it is also obvious if you collect your accounts receivable within ten days *fater* the end of the month you will have enough.

Q. That will be another quarter section, it won't be this cash in the bank, be some more cash?

A. Be some more cash.

Q. And we may have some more accounts to pay?

A. Probably.

Q. Now you say this you have considered there the amount required to operate the business, that is right isn't it?

A. Yes.

Q. That means the amount required to carry the accounts, carry the supplies and carry the things that are paid for in advance and to carry the proper cash balance.

A. Yes.

Q. Now what is this balance sheet here on page 27?

A. That is a summary of the balance sheets of December 31, 1910 and March 1, 1909, reversing the entry we talked about this morning, the $254,000.

3326 Q. March 1, 1906.

A. March 1, 1906, yes.

Q. This is only material on this immaterial question of the amount of so called water in the stock isn't it?

A. That is all.

Q. Now turn to page 28, you have there an account showing some profits?

A. Yes.

Q. Are those as shown by the books?

A. Yes.

Q. Any adjustments?

A. The adjustments as shown at the end of the table.

Q. That is you have taken out the expenses the $5,935.18 which the company has already paid on account of this suit.

Q. Yes.

Q. Or had paid at that time?

A. Yes, and put into expense that federal tax.

Q. Did you charge any depreciation?

A. No. That is as shown by your own balance sheet.

Q. So that *y*ould have to be corrected by depreciation?

A. It states that it is accumulated increment shown by your balance sheet.

Q. To be of any value to us, we would have to take depreciation out?

A. Oh yes, if it was to give actual facts.

Q. Could not draw any conclusions on it to use in this case?

A. Not until you took depreciation out.

Q. Why did you take out that $5,935.18?

A. Because that is not an ordinary expense. I increase your profits by the amount of $5,835.18.

3327 Q. These were profits we did not have, we had to pay out the money?

A. I know you had to pay out the money. I say that is not an ordinary operating expense of the business.

Q. Suppose one of our holders should be struck by lightning would you say that damage was ordinary operating expense?

A. I think you would call that loss of capital.

Q. What would you do if we had repaired it, would you charge that to capital account?

A. No.

Q. Charge it to operating?

A. Be an extensive repair spread over a number of years.

Q. And charge it to operating?

A. Oh yes.

Q. There are just two general heads for the account, one is capital account and the other is operating.

A. No, I think you are stretching it rather fine. There is a midway head for such expenses as these are.

Q. There is what?

A. Sort of one between for expenses such as these replacement expenses.

Q. What do you call it?

A. Has no name, an operating expense by the company is no place for large extraordinary expense.

Q. Got to go there ultimately?

A. Got to be taken care of ultimately.

Q. In the operating?

A. Not necessarily.

Q. You take care of it as a capital expense?

A. No.

Q. Where would it go if it didn't go to operating?

3328 A. It would be held in suspension.

Q. Can't hold it there all the time.

A. No, I should say you should be allowed a certain allowance to take care of this.

Q. You are an expert accountant chartered accountant and public accountant. Now I want to know whether these expenses whether they are ordinary or extraordinary expenses that come out of the transaction of the business don't they ultimately go into operating?

A. Suppose I concede your point that they ultimately go into

operating but can it be regarded as operating in a manner of this kind?

Q. But that is not an answer to my question. They ultimately go into operating, they can't be capital.

A. They are not capital.

Q. That means if not capital they must go into operating?

A. They must go into operating but not in a case of this kind.

Q. In a case of this kind would you call them capital?

A. No.

Q. Where would you put them?

Q. Put them in suspension.

Q. Leave them there indefinitely?

A. Up to you to take care of them in subsequent years.

Q. When we did take care of them would they go into capital or operating?

A. In operating, but not in a report in operating in a matter of this kind.

Q. Then you would have some expenses that in a matter of this kind we would have to pay out of our own pockets?

A. No, I don't think I suggested that? I suggested that the margin of return should be so much higher to enable you to take
3329 care of such expenses.

Q. Don't you know as an accountant who has taken some law at Edinboro and political economy and so on we cannot pay dividends except out of net profits?

A. I know that.

Q. Going to deduct this before you get net profits or is this part of the net profits out of which we have got to pay dividends?

A. Well you get your net profits then make the deduction for expense and pay dividends out of the balance.

Q. In other words our net profits include expense?

A. They do, but not those expenses of ordinary operations, the operating of this business don't include an extraordinary charge like that.

Q. They would have to be paid out of the receipts from the operation of the business.

A. You have got to pay them some time.

Q. You would have to pay them out of the receipts from the operation of the business?

A. Yes, or get more capital in.

Q. You have said they are not a proper capital charge?

A. You can't capitalize them not properly.

Q. They are an expense that grows out of the transaction of the business and must be paid out of the receipts of the business?

A. Yes.

Q. And still you say they are to be paid out of net profits. Suppose we don't make any net profits?

A. Then you just carry them along until you do.

Q. The company might just earn enough to pay these without making anything more.

3330 A. You would not pay a dividend I think in ordinary course, perhaps you have not made any profit of operating this business before you take into consideration such extraordinary expenses as these.

Q. What is the definition of net profits?

A. Profits received from the operation of a business in ordinary course.

Q. Take a railroad like the Chicago, Rock Island & Pacific Railway that has continuous expenses for rate cases, what are they charged to?

A. They are charged as expenses.

Q. Do they go into operating?

A. I don't know, I have not seen their balance sheet.

Q. Is it your theory they ought to be paid out of the profits?

A. Got to be paid from profits.

Q. They are not part of the operating expense?

A. No.

Q. Then there are certain expenses in connection with the transaction of the business that to your notion are not operating expenses?

A. Yes, there are.

Q. And the net profits is the difference between what you call operating expenses and the gross receipts without the payment of these special expenses?

A. Yes, the net profits of operating a business in general course is before charging these expenses.

Q. Would you be willing to just strike out "in general course"?

A. No, I would not be willing to strike out in general course. You can charge these expenses before getting your net profits in a case of this kind.

3331 Q. That is a matter of law.

A. It may be a matter of law, but as a matter of accounting you can determine your net profits in a case of this kind after charging these expenses as an expense.

COURT: You would then allow the cost of insurance against lightning and fire or anything of that kind as a part of the ordinary expenses?

A. This is a matter of insurance.

COURT: And that would be to liquidate a loss by fire or lightning if it occurred?

A. Yes.

Q. Give us some other special expenses that could not be included in operating expense?

A. There might be quite a number of special advertising expenses that would be entitled to charge only as a proportion in any year and charge the balance forward to the next year and so on.

Q. I am not questioning that, it is not a question where we are going to spread it, but where it is to go.

A. It has got to be ultimately taken care of from your profits, I don't dispute that at all, but I do say you can't include it as a general expense in a matter of this kind.

Q. Why is there any difference between bookkeeping here and bookkeeping if a man was buying bonds?

A. Will you explain that a little more fully, I don't understand it.

Q. You say it can't be taken into account in a case like this, now suppose that a man was talking about making an investment in the bonds of this company and wanted to know what expenses of carrying on the business were and the company had spent $100,000 in a rate case and you were to report on it, would you ignore that $100,000 if it had been paid and show net operation in
3332 addition to that?

A. No, in a case of that kind I would except them in operations make a reduction for the purpose of rate expense and show the balance available for interest.

Q. In other words you say here this extraordinary expense we have got to spread it over a term of years in order to know what would be the fair earning for this plant under normal conditions, charge it with a fair proportion of these expenses.

A. Yes, that is my idea I have tried to explain all day.

Q. Now in this case if you had spread this $5,935.18 over the five years you would have charged in for rate litigation a little over one fifth of a cent per annum?

A. Yes, but it would not be correct at all, it should be charged over the next period. It has nothing to do with this period under review.

Q. Nothing to do with the period where the expense is incurred. You would not begin with that period?

A. If I began at all I would begin the next period.

Q. Do you think that the time over which this should be spread would be affected at all by a local situation which prohibits cities fixing rates for any specific term or prohibits them making contracts for any specific term?

A. I would not care to express an opinion on that.

Q. Turning to your table on page 29 what you attempt to show there is the per cent of return?

A. Yes.

Q. That is not based on the value of the property?

A. No.

Q. And is not based on the actual investment?

A. No.

3333 Q. And does not take into account appreciation?

A. No.

Q. So it does not show what the investor has been actually earning on either the value of the property or upon his investment.

A. It does not. That is the investment as shown by your books.

Q. Now where did you get this net revenue?

A. From your books.

Q. Have you checked it at all, do you know where you did get it?

A. No. I am told it came from the books and the records.

Q. But do you know what if any adjustments were made in it?
A. No.
Q. This you say includes depreciation?
A. Yes.
Q. And on the basis of six cents a thousand?
A. Yes.
Q. You have not checked these figures yourself?
A. No.
Q. Don't know anything about them more than appears on the face of the papers?
A. Made up under my instructions, yes.
COURT: Before you leave page 29, what do you count the investment?
A. The investment accepts the affidavit of Col. Pratt as the commencement and adds all subsequent additions as shown by the books taking out a deduction in respect to depreciation.
COURT: Why do you take the depreciation out of investment?
A. The plant is wearing down each year, so much of the plant has got to be absorbed.
COURT: Why not just leave the investment stand and not count anything for depreciation?
3334 A. I don't think that would be fair.
COURT: Wouldn't that be practically the same thing?
A. No, sir.
COURT: That is as far as the investor was concerned?
A. No. The investment today is not worth as much as they pay for it on the theory that the plant is wearing down each year.
COURT: Of course that is getting at the value of the property, I am speaking of investment.
A. If I did not consider depreciation at all there is a deduction from the investment or operating expenses you might take that away which — give considerable larger returns.
COURT: Investment is the amount of money put into the plant from start to finish.
A. Yes, less that proportion worn out.
COURT: The value of the plant entering in?
A. Entering in altogether.
Q. You say at the bottom of this page that 11.12 per cent would be the return on this investment subject to certain modifications.
A. Yes.
Q. If depreciation had been omitted?
A. Yes.
Q. Deduct that 9.56 from that and let us see what your average depreciation has been?
A. That 11.12 applies to the year 1910?
Q. Only to the one year?
A. Yes.
Q. You state on page 30 at the top of the page and I think you added the same statements in your testimony several times the U. G. I. company obtained control of this property and operated it. What

do you mean by saying the U. G. I. Company operated this
3335 property?

A. They owned the stock and it was operated under their general supervision or ownership.

Q. Now as a matter of fact the U. G. I. owned the stock.

A. My understanding of it, yes.

Q. And the company was operated by its officers, I mean by the officers of the Des Moines Gas Co., under the instructions of its board of directors?

A. Yes.

Q. And the U. G. I. company exercised the control that owners of stock ordinarily exercised over a corporation?

A. Yes.

Q. Nothing abnormal or unsusual in that?

A. It is not meant in any offensive way at all.

Q. How did you get that $640,709.16?

A. That represents the balance of surplus income taken from the company.

Q. How is it made up. Did you make it up.

A. No.

Q. Is any depreciation in there?

A. No. Exactly as shown by your books.

Q. Is the $264,000 ite-, charged out of it or in it?

A. It is in.

Q. Then that means this that the $640,709.16 is the amount which your assistant computed as the income without deducting depreciation from 1886 to the end of 1910.

A. No. To February 28, 1906.

Q. Now you have a dividend here of four and one fourth per cent April 1888. Is that the only cash dividend that the company has ever paid?

A. Yes.

—. ——.

3336 A. $12,750.

Q. And the balance of these earnings $168,255.56 prior to June first, or December 31st, 1896, went into a stock dividend?

A. Yes.

Q. Now that was money then that had been invested in the plant?

A. Yes.

Q. Did you cut that out as water?

A. The $168,000 no I did not.

Q. So that all of these profits except $12,750 were put into the business?

A. Put into the business.

Q. At the top of page 31 you have an entry income from July 1886 to December 31, 1910 which amounts to as you have it $1,074,393.88 that is right is it?

A. Yes, sir.

Q. And as you have made up your statement here the company has used about $250,000 of that or you have charged them with that on account of depreciation, the balance of it is in the plant.

A. Yes, subject to that small dividend.

Q. $12,750?
A. Yes.
Q. Now as a matter of fact all of that depreciation fund you have deducted has gone back into the plant hasn't it?
A. Yes.
Q. You didn't give us credit for any of it did you?
A. I don't follow your question at all.
Q. You took off $250,000 in round numbers, as I recall 245 thousand and something isn't it?
A. Yes.
Q. Of the value of the plant on account of depreciation?
3337 A. Yes.
Q. We put that all back.
A. That makes no difference.
Q. So we neither have value nor depreciation fund on your theory?
A. No, your plant depreciated to that estimated extent.
Q. I know, but did you give us credit for $1,074,393.88?
A. Yes, sir.
Q. As new money put in?
A. Yes, it is in your investment account.
Q. Now you said in connection with Exhibit 33 that Mr. Hagenah in his estimate of the investment value had made a fundamental error?
A. Yes, sir.
Q. What is the theory upon which Mr. Hagenah's estimate of the investment value is made up?
A. The theory is as I understand it that the deficit of earnings under eight per cent shall be capitalized and that any excess over eight per cent shall be credited to the investment account.
Q. Do you credit it where that credit results in cutting down the actual investment of the plant?
A. As it was done in this statement.
Q. Which statement.
A. Mr. Hagenah's statement.
Q. He didn't make any such credits did he?
A. He didn't t-eat it that way, that was the net result of what he does.
Q. He didn't treat it that way did he.
A. He didn't treat it that way, but that is the net result of what he did.
Q. We will come back to that later, I think you are mis-
3338 taken. Now then is this right as you understand that theory Mr. Hagenah takes the original investment, then he takes the additional investments, then he takes a return computed at some rate and adds the return to the opaerating and the depreciation?
A. Yes.
Q. Then deducts the gross receipts?
A. Yes.
Q. Now the effect of that is this is it not and this is the whole story of it that if the return in the earlier years is inadequate to take care of these things, so as to give the investor a fair return that

difference, that loss is capitalized and he is given a return on it until he has been reimbursed.

A. That is the idea.

Q. Now in order to make him whole you must give him say to take as an illustration a plant that costs a hundred thousand dollars, now he would be entitled to each year to $8,000 on an 8 per cent basis and he would be entitled to his operating which we will call $15,000 and to his depreciation which we will call $1,750, wouldn't he?

—. Yes.

Q. Now that is what Mr. Hagenah did.

A. Yes.

Q. Now what you have done is to give him his depreciation and then take it away from him with interest haven't you?

A. Exactly.

Q. So you have penalized him $437,441.00 because you gave him the depreciation?

A. No, I have not.

Q. Let's see if you haven't. You take this Exhibit 33 in
3339 the summary here you have analyzed this this way haven't you, you have first taken the total cost of the plant?

A. Yes.

Q. $2,064,118?

A. Yes.

Q. That includes the original cost and additions?

A. Yes.

Q. Now you have added your interest or return on the plant and on the additions which amount to $2,453,719?

A. Yes.

Q. That makes a total of $4,517,837?

A. Yes.

Q. That is what the investor has in it, that is he has got his money and interest?

A. That represents his money and interest on his money.

Q. For the whole period?

A. For the whole period.

Q. Now what he has taken out is his gross earnings less certain things?

A. Yes.

Q. Now you have gross earnings, $5,159,853? Now will you please deduct from that the operating expenses not taking out the depreciation at all, assuming that he is not entitled to depreciation.

A. $1,774,268?

Q. That would leave him that much, not assuming he was entitled to any depreciation?

A. Yes.

Q. Now deduct that from what he has put in, $4,517,837.00 and what do you get?

3340 A. $2,743,569 which figure includes the interest on the depreciation which went in.

Q. You have volunteered something which is not in answer to my question. Now I wish you would turn to the summary on page

2 of this report. Now just point out to the Master if you will, how much interest went in on that depreciation?

A. On the depreciation there is included in the interest some about $430,000.

Q. Will you turn to your summary. Now then will you just point out in that summary how much interest you put into the $4,517,837 on account of interest on depreciation?

A. Mr. Hagenah has in the—I accept his figure which includes that depreciation.

Q. You have put down investment in the plant?

A. Yes.

Q. You have put down next 8 per cent on opening balances?

A. Yes.

Q. That is investment in the plant?

A. After charging the depreciation.

Q. Turn back and see what the column opening balances is? What is the column opening balances there?

A. The column opening balances as I have represents the investment.

Q. Tell me which column?

A. The first column.

Q. The column begins $308,983? This first figure in that column represents actual investment?

A. Yes, the second figure includes the element of interest on that depreciation.

Q. In your summary here you don't pur any interest on that depreciation do you?

—. ——.

3341 Q. I didn't ask you that. In your summary you assume that the earnings were large enough to pay the depreciation and operating?

A. Yes.

Q. And if that is so, there could not be any interest on it because it would have to be paid?

A. No, the interest is in that figure, the interest on that depreciation is calculated.

Q. Now then go on a little further. You make a deduction there $2,743,569?

A. Yes.

Q. The interest you make your depreciation fund earn at 8 per cent amounts to $437,441.00 don't it?

A. Yes.

Q. Now deduct that from the $2,743,569?

A. $2,306,128.

Q. In other words that is your result?

A. Yes.

Q. That makes the man just $437,441 worse off than if you had allowed the same depreciation over here.

A. That is the correct working out of that table on your theory, it makes him $437,000 worse.

Q. I am coming to that later, but please answer the question.

Your man is just $437,441 worse off than he would be if — had allowed him depreciation by your *very* summary here isn't he?

A. I don't agree with that no.

Q. Now do you say that this amount $4,517,837 or the amount preceding it, $2,453,719 includes interest at 8 per cent on this depreciation from the outset?

A. Yes.

Q. Then will you please turn back to your computation here and tell the Master whether to put the depreciation in *in* column 6 and take it out again in the first two of the last three columns affects the result at all?

3342

A. Take it out of there and take the corresponding interest out with it, take all that out and results the very same.

Q. You say on one side of this amount that is in this $3,136,231 you have your depreciation, $392,362 and your interest on that $437,441, don't you?

A. Yes. I say the depreciation is again in plus the interest.

Q. It is already in?

A. Yes.

Q. You have taken out just that same amount?

A. Yes.

Q. Now would your computation have been just the same if you had left depreciation out altogether?

A. If I had left out depreciation altogether it would have been the same.

Q. So that all you have done then by the changes you have made is to take out the depreciation factor from the Hagenah computation?

A. Yes.

Q. Then you have not allowed the man the depreciation, have you?

A. No, I have not.

Q. You have given it to him and then taken it away, that is the difference between your computation and Hagenah's isn't it?

A. Oh no. Hagenah's computation charges the plant with an allowance for depreciation, but that same ch-rge should be credited to -he plant or put up in a reserve.

COURT: The difference between you is this, the depreciation is given to the owner of the plant by Mr. Hagenah and he is entitled to interest on it?

3343

A. Yes.

COURT: But by your calculation the public is entitled to the interest on it instead of the owner of the plant?

A. Not exactly. Mr. Hagenah, before getting out his net profits charges out an allowance for depreciation. That same allowance must be put into the replacement of the plant or set up in a depreciation reserve otherwise you are penalizing the consumer to the advantage of the company.

COURT: You don't allow him any depreciation.

A. I allow him the depreciation in addition to that, but he has

got to put that depreciation fund out on the same basis at which he is charging the consumer the 8 per cent.

Q. You give him a depreciation and make him account for it plus 8 per cent interest compounded?

A. Yes, if you are going to take 8 per cent out after charging depreciation, if you are going to say my operating revenue is so much after taking out expenses with an allowance for depreciation you have got to take that same depreciation out of your plant or put it up in reserve.

Q. That is a question that I don't care to discuss with you now, we wil- get to that later. I want to stick to this until we get this straightened out first. You have assumed in your calculation that all of this depreciation is earning interest all the time.

A. Yes.

Q. Now is there any year where the gross revenue was not sufficient to pay both the operating expenses and the depreciation?

A. I don't recall.

Q. Well let's look and see.

A. It won't pay the return I concede you that for a number of years.

3344 Q. It will pay if your figures are right as to return it will pay operating and depreciation won't it because you figure out a net return every years?

A. Yes, on that theory.

Q. Well wasn't that right.

Q. On these facts.

Q. You did figure out a net return every years?

A. Yes.

Q. Now then l-t's take the first year for instance, what was the gross revenue?

A. The gross revenue $78,793.

Q. What was the operating?

A. $51,553.

Q. And what was the depreciation?

A. $5,997.

Q. Total.

A. $57,750.

Q. Now what is the difference between that and the gross earnings?

A. $21,043.

Q. Now then how much was the return in that year, $24,719 wasn't it on the original capital?

A. Yes.

Q. And $736, and how much were the additions to the plant?

A. $18,394.

Q. What is the total of these things?

A. Total of that things.

Q. Last three items.

A. $43,849.

Q. Only had $21,043 to pay them with?

A. Yes.

3345 Q. Your assumption then that all of this depreciation is bearing 8 per cent and is in that column $3,136,231 leaves the investor without his return and without any interest on it.

A. I am not arguing about the earning capacity of that depreciation. I say here it is accumulated on a basis of 8 per cent.

Q. Please answer my question. Your assumption that your depreciation is all earning interest at the rate of 8 per cent per annum results in leaving the investor without a return and wit-out any interest on it don't it?

A. No, I don't agree with that.

Q. Where does he get return or interest on it?

A. You are charging the con-umer here——

Q. No please answer my question. Where does the investor get his return or interest on the deferred part of it.

A. That question cannot be answered without an explanation.

Q. Go ahead. See if you can explain it.

A. In this column you have charged up depreciation. I admit the first year he did not earn 8 per cent on your investment. You are charging up that depreciation and also charging that plus 8 per cent. In other words the company is taking credit for this $5,997 of depreciation plus 8 per cent on them. On the other hand the consumer has something to say about it and he should have that fund put up as a credit to take care of wear and tear on that plant at the same rate of interest.

Q. I asked you where the investor was getting his return or interest on the return if it was deferred if your theory that all of this depreciation drew 8 per cent was sound, can you tell us wher-?

A. He is not getting 8 per cent in this year.

Q. Well then is your theory that all of this depreciation draws 8 per cent compounded and that goes into this column $3,136,231 correct?

3346 A. Yes.

Q. It is?

A. It is.

Q. Now let's see for a minute and see whether that works out. Take the first year. We had there the value of the plant at the close of the year was $331,789 as estimated by this table?

A. Yes.

Q. At the first of the year it was how much?

A. $308,983.

Q. That shows that during that year there had been a failure to pay this return and operating and depreciation amounting to that difference don't it?

A. Yes.

Q. How much is that difference?

A. $22,806.

Q. That is what is added and bears 8 per cent isn't it?

A. Yes.

Q. The investor will not be made whole unless you do add that and give him 8n per cent on it until he earns enough so as to recoup these early losses will he?

A. That is so.

Q. That is right?

A. Yes.

Q. Now if you call take that from the depreciation and then take it out of this will the investor be made whole?

A. No, it alters the investor's position considerably.

Q. The investor will not be made whole will be?

A. If you adopt your theory. My theory is a fair one to the investor and correct one.

3347 Q. Will the investor be made whole, will he receive the interest on this $22,806 that he has lost the first year until it is repaid to him on your theory if you take off depreciation at 8 per cent?

A. Only receive return on the increase over the amount of that depreciation $16,809.00.

Q. So he would be loser on your theory not getting that back?

A. No, would not be loser, counting something he is not entitled to.

Q. What?

A. This depreciation compounded.

Q. Under this theory, we are talking about this theory and not about what ought to be, but the theory on which this report is made. Under the theory on which this report is made he is entitled to just that thing, that is to have that $22,806 added to the investment until he is reimbursed?

A. Assuming the Hagenah theory to be correct, yes.

Q. Under that theory he is entitled to have this added?

A. He is not.

Q. Not under that theory?

A. Only entitled to have added the difference between that $22,806 and $5,997.

Q. So if the expense and the depreciation for each year leave nothing to be applied on the return so he got no return, then he would not be entitled to have anything added for that year, that is right, isn't it?

A. That seems right.

Q. Have you carried out the logical conclusion.

A. Yes.

Q. So the bigger his loss was under this theory the smaller his reimbursement would be?

3348 A. No.

Q. Take arbitrary figures for a minute. This $22,806, the difference between $22,806 and $5,997 and your operating?

A. Give him an operating expense $68,562.

Q. On that assumption the only thing left that was met would be the amount of your depreciation wouldn't it?

A. No, I don't think that is a proper interpretation of that at all.

Q. Well take such figures as on the assumption the amount left in at the close of the year will be $5,597 with nothing for a fair return. On your theory that would give nothing to the depreciation fund

and with absolutely no return there would be nothing to reimburse the investor, that is right isn't it?

A. No, I don't agree with that.

Q. What is wrong with that, why don't that drive you to this position?

A. If you take this one allowance for depreciation.

Q. Take these specific figures where there is not any return except an amount just enough for depreciation?

A. The first year he gets you state to me, that is more than enough.

Q. I want to illustrate your theory by taking a case where it is not, and then want to ask you where the investor would come in, assuming that what is left after you take care of your depreciation goes into the capital.

A. The investor would be left with the balance of $2,300,000.

Q. You are not answering my question are you?

A. As I understand your question.

Q. Well Let's try again. Take this first year and assume that your expenses were such that the amount left after you made
3349 your gross earning deductions just took care of your depreciation, $5,997, upon your theory that would be set aside and draw 8 per cent?

A. Yes.

Q. How would you take care of the loss of the investor?

A. The investor is being taken care of as the years go past.

Q. This is the first year?

A. The first year you will carry forward whatever balance you will carry to make up your 8 per cent?

Q. He would not carry forward anything on your theory?

A. I am not quarreling at all with the theory.

Q. The trouble with me is you are not answering the question.

A. I can't understand it.

COURT: Suppose that that plant had been earning 8 per cent right along, figures out 8 per cent as I understand this Wisconsin theory is for the purpose of getting at the value of the plant?

A. Supposed to be the idea as I understand it.

Q. If it earned 8 per cent and run long enough it would pay for itself.

A. Certainly have a credit balance.

COURT: The more it earned the less the plant would be worth at the end of the period?

A. Certainly.

COURT: The less it earns the more it would be worth.

A. Exactly.

COURT: That would be the practical effect?

A. Yes.

COURT: On the other hand you take it they are not permitted to earn more than 8 per cent and the loss is simply made up to that, would be a different result?

3350 A. Yes, increase the value of the plant, it would increase the investment value of the plant.

Q. If you run over 8 per cent on this theory it increases this investment.

COURT: Well your report is based on investment.

A. I am not saying anything about the investment this way, I am dealing with it on this statement.

COURT: As I understand Mr. Hagenah's plan, the Wisconsin plan as he explained it and as I understood it, the idea was to give the plant 8 per cent and no more, fix the value upon which rates are to be judged?

A. That is the theory, yes.

COURT:

Q. That and no more?

A. My idea is he did not apply his theory properly. That is the fundamental idea of the Wisconsin plan.

Q. If they had already earned that 8 per cent?

A. It would greatly reduce the value of the plant.

COURT: But you take this through your depreciation and make it what you term a fund and put it out upon interest at 8 per cent.

A. I don't care whether put in a fund or not. If they use depreciation and put it back in the business.

COURT: The difference between you two, you charge interest upon the depreciation, compound interest at 8 per cent?

A. Yes, he charges the depreciation in at 8—I might illustrate the thing this way if you take your depreciation reserve and make your additions to the plant out of your reserve you will be right down on the basis I have made you now. Even take your operating expenses and charge repairs against depreciation reserve and you will get down to the same result I bring out.

3351 Q. You have attempted to state here what we call the Wisconsin theory. Do you know of any case in which the Wisconsin theory has held that you should make deductions from the actual value of the plant or actual investment in the plant on account of the excessive earnings?

A. I think I am correct in stating that the Madison decision it pulls down the investment quite considerably.

Q. The actual investment?

A. The actual investment is pulled down on account of the excessive earnings, the earnings being in excess of the rate amount.

Q. That was in the Madison case?

A. Yes.

Q. Have you read it?

A. Read that part in regard to going value.

Q. Who called your attention to it?

A. I borrowed the report from Prof. Bemis, he had the case.

Q. And when?

A. It was within the last couple of weeks or so.

Q. Can you put it a little closer than that?

A. Well since I left here last.

Q. Can you put it a little closer than that?

A. I am afraid I can't. It was within about two weeks ago.

Q. Let us take for an illustration here some round figures so we can get away from the bother of odd amounts. Suppose you have a plant worth a million dollars and your depreciation is say $17,500 you earn enough to pay everything including the depreciation except the return. Now you set aside your depreciation at the end of the year. What becomes of the return?

A. It goes forward—the absence of return goes forward into the next year.

3352 Q. In the absence of the return?

A. Yes.

Q. Then that would draw interest?

A. Yes.

Q. Now as a matter of fact that would have to draw interest in order to reimburse the investor?

A. Yes.

Q. More than that the investor would have to have the depreciation in order to reimburse him wouldn't he?

A. Yes.

Q. If he didn't have both of these he would not be made whole?

A. He would not.

Q. And he would be entitled to the depreciation at the end of that year wouldn't he?

A. Yes.

Q. At that time?

A. Yes.

Q. And the amount of depreciation that he would be entitled to would not be at all affected by what he did with it.

A. Not at all.

Q. Now then if you take that depreciation and interest that it earns away from him when you get through have you made him whole?

A. I am not taking it away from him. He has it.

Q. You have deducted from the amounts made and given here by figuring interest on this deficit and the amount of depreciation, $392,662?

A. Yes, $437,441 interest accrued on it. Took depreciation plus interest went into the plant.

Q. I don't care where it went, this man had to have both the depreciation and if the payment was deferred he would have to have interest on that and his return to make him whole?

3353 A. Yes.

Q. Mr. Hagenah gives him both depreciation and return?

A. I think he gives him depreciation twice that is all.

Q. You take away from him depreciation after giving it to him once?

A. I take away one. Mr. Hagenah doubles up on that depreciation and I separate it and give him one.

Q. Where does Mr. Hagenah give him twice?

A. On one side income charge depreciation on investment and not use it for getting reserve, purely a matter of book-keeping.

Q. If you give it to the investor and take it away from him and put in into reserve would he have it?

A. He has it used in his business, the reserve is there.

Q. As part of the value of the plant?

A. Yes.

Q. Then why do you deduct it from the value?

A. That depreciation is wearing down of the assets in the plant.

Q. You say you have this reserve, put it as part of the value of the plant?

A. Exactly, so much of the amount of the plant to be worn out and the reserve itself used as an extra consequently your original plant is not worth as much as you paid for it only worth what you paid for it less what you have reserved.

Q. Now you have gotten on another subject.

A. Same old subject.

Here the further hearing of this case was adjourned until 9:30 o'clock tomorrow morning.

3354 Friday Forenoon Session.

SEPTEMBER 15, 1911, at 9:30 a. m.

Counsel for the respective parties all present.

Testimony on part of Defendants resumed as follows:

JAMES HALL, continuing his cross examination, examined by N. T. Guernsey, Esq., testified:

Q. Now, Mr. Hall, I understood you to say yesterday that Mr. Hagenah put depreciation in twice and that you took it out once, because it ought only to go in once?

A. I don't think that is a correct interpretation of what I said.

Q. I prepared a statement here, Mr. Guernsey, a somewhat similar one, if you care to see it.

Q. Well, let us take this one first. You did say, as a matter of fact, didn't you, yesterday, that Mr. Hagenah put depreciation in twice?

A. That is the sum and substance of his statement.

Q. What I am asking you about is what you said on yesterday?

A. I will try and tell you what I said yesterday. I said this: Mr. Hagenah takes the plant at the commencement at its face value, one hundred dollars, and he adds his depreciation, compounding both figures.

Q. You said, did you not, on yesterday that Mr. Hagenah put depreciation in twice?

A. That is added——

Q. Just answer the question—didn't you say that on yesterday?

A. I don't recall using those words. I said——

Q. Don't get away from this; just let us stick to this for a moment. Didn't you say on yesterday, at least once, and probably

twice, that Mr. Hagenah put depreciation in twice, or that in substance?

3355 A. I don't recall saying that exactly that way.

Q. I don't want any limitations—didn't you say that or that in substance?

A. I will say that in substance.

Q. That is the fact, is it?

A. It seems to me to be the fact, yes.

Q. Now, then, let us take the first computation here for the first year. You start with $308,983. Now will you add to that, please, additions to the plant, $18,394?

A. Yes, $327,377.

Q. Now take the two interest charges, amount to what, together?

A. $25,455.

Q. Now, then our operating is $51,753?

A. Yes, sir.

Q. Our depreciation $5,997; that makes how much?

A. $410,582.

Q. Oh, no; you misunderstood me. Add operating and depreciation together?

A. $57,750.

Q. Now you- income was how much, your revenue?

A. $78,793.

Q. So that you had left after paying your operating and depreciation, how much?

A. $21,045.

Q. The return he was entitled to was $25,455?

A. Yes.

Q. And you didn't have quite enough to pay the return?

A. That is so.

Q. Now deduct that, will you, and tell us what the balance is?

A. $4,412.

3356 Q. Now, then, that year the depreciation did not go into this fund to be compounded?

A. Yes, the depreciation goes in there to be compounded.

Q. There is only $4,412 in the aggregate?

A. No, after taking out $5,997.

Q. In order to get that depreciation in there, to add it to the capital because it had not been paid in the first place, you wouldn't have enough deficit to get it all in?

A. What in?

Q. All the depreciation out of that year's business?

A. I don't get that question at all.

Q. Well, then I will try it again. You- gross income from that year's business is enough to pay your operating and your depreciation and your return, but with a deficit of $4,412?

A. Yes.

Q. So that the deficit in that year amounts to less than the amount of your depreciation?

A. Yes.

Q. Now, then, that $4,412 wouldn't be a deficit in depreciation; it would be a deficit in return, wouldn't it?

A. Yes.

Q. So that no depreciation would go into your additions there; your additions there would be made up of $4,412 that was short on the return?

A. Yes, subject to the deduction of the depreciation.

Q. But deduction from what?

A. Well, take your plant at the beginning of the year, $308,983; you do not contend it is now worth $308,993, plus depreciation; it is only worth 98% of its original value according to Mr. Hagenah——

3357 Q. But I have put this in a different way as I think you misconstrue it or have a misunderstanding of it. I have simply taken the plant and the additions to it; that is proper, isn't it?

A. Yes.

Q. I have got $327,377?

A. Yes.

Q. Now, then, in order to maintain that at that amount I must have that depreciation given to me on this depreciaion basis, must I not?

A. Yes.

Q. I must also have my return, or else I am short?

A. Yes.

Q. It develops that after they give me that depreciation, to maintain my plant in that condition, I am short $4,412 on my return?

A. On that theory, yes.

Q. That is the theory that is made up on?

A. Yes, but it is a wrong theory; that is the Wisconsin theory.

Q. But I have maintained my plant just as it was, $327,377, because they have given me that depreciation to do it with?

A. You have maintained that plant at its original——

Q. Yes, with that depreciation, but I am short $4,412 of return?

A. Yes.

Q. Now, then, I put that return into my plant as a part of my earlier losses because if they have not given me the return the best thing they can do is to pay me interest on it, defer it and pay interest on it. Then that gives me, when I add $4,412, $331,789?

A. Yes.

Q. How did we get depreciation in twice there?

A. You have the original value of the plant, $308,983, which you claim is at its face value, plus an allowance for depreciation. I would not contend that the original value was 100%; I con-

3358 cede you 98% plus depreciation.

Q. Well, I don't know what you mean, but I am sure your intentions are good. Now let us come back to earth. I have here $327,377, haven't I?

A. Yes.

Q. Now, I was entitled to depreciation to keep that good for that year on this 2% basis to $5,997?

A. No, not as you are figuring this here——

Q. Isn't that the amount of the depreciation?

A. That is the amount of the depreciation, but you already have your depreciation in your original allowance, $308,983.

Q. We start with $308,983 as the value of the plant?

A. At 100% value.

Q. Just let me ask the question, please. Now, then, leave these figures out. We will start with something that is hypothetical. I have got a plant worth $100,000 at the beginning of the year and I am entitled to a depreciation of 2%?

A. Yes.

Q. I am entitled to 8% return?

A. Yes.

Q. That depreciation would be $2,000?

A. Yes.

Q. We will say it cost me $15,000 to operate it and that I have got an income of $21,000?

A. Yes.

Q. Now I take that, at the end of the year my plant without the depreciation is worth $98,000?

A. Yes.

Q. Now I take that income and I first pay my operating and that leaves me $6,000 and then I pay my depreciation; that leaves
3359 me $2,000. I put that $2,000 back there to bring my plant back to 100%. Now, then, I have $4,000 left to apply on my return and I am short $4,000?

A. Yes.

Q. I add that $4,000 to my $100,000 because they have not paid me and we will say they owe it to me and pay interest on it?

A. Yes.

Q. Now, then, have I got anything out of that except just what I had when I started, plus the fair return?

A. Yes, figuring on this theory you would be getting $106,000——

Q. Just wait a minute—on these figures, what have I got at the end of the year?

A. You have your $98,000, depreciated value of your plant.

Q. I have got $2,000 depreciation?

A. Yes.

Q. That brings it back to where we started?

A. Yes.

Q. That is $100,000?

A. Yes.

Q. I have had $4,000 in income?

A. Yes.

Q. I have taken out my $4,000?

A. Yes.

Q. I was entitled to $8,000?

A. Yes.

Q. I failed to get the second $4,000 so I have added that to the value of the plant?

A. Yes.

Q. Have I made any money?

A. No.

3360 Q. I am just square on that?

A. Yes.

Q. And if you didn't give me that depreciation I would be just $2,000 short?

A. Yes; but you commenced this hypothetical question, you commenced with your depreciated value at $98,000.

Q. In what question?

A. We commenced the plant with $100,000 which depreciated to $98,000.

Q. During that year?

A. Exactly.

The MASTER: The difference between you gentlemen is just this: he figures on the value for a rate all the time and you figure on the investment, that is the difference.

Mr. GUERNSEY: I don't think that is exactly the difference between us.

Q. You don't think they would be permitted to put this back into the plant?

A. No, not in actual practice.

Q. Now I call your attention to Exhibit 56, which is a computation on this same basis, except no allowance for depreciation whatever is made, so of course the capital is not maintained unimpaired, and that checks out with what the total is there, the final figure?

A. $2,305,758.

Q. Now, then, will you give us the figure you got here after you deducted depreciation?

A. $2,306,128.

Q. Now, would you say that confirms my notion that what you have done is simply to take the man's depreciation away

3361 from him in making what you say, your corrections of Mr. Hagenah's computation?

A. I take the man's depreciation plus the interest at which it was compounded.

Q. So that the difference between you and Mr. Hagenah is, you do not allow depreciation and Mr. Hagenah does?

A. No, I allow the man to maintain his plant at his original hundred dollars and Mr. Hagenah is insisting it is a hundred and two dollars.

Q. Will you at your convenience check over this Exhibit 56. I won't ask you to do it now, but I want no question between us ultimately as to the correctness of the computation?

A. Yes, I am very pleased to.

Q. Will you also, if you find any errors in the computations call our attention to the matter?

A. With pleasure.

Mr. GUERNSEY: With that understanding we offer Exhibit 56 in evidence.

Objected to on part of defendants as incompetent, immaterial,

not cross-examination, and based upon assumptions not in the evidence or record.

Q. Now, Mr. Hall, I wish you would turn over to a later page here which you headed, Des Moines Gas Company Annual investment value on a six per cent return basis, in Exhibit 33; this computation which you made yourself is based upon the valuation which was made as of December 31, 1895, plus $50,000 working capital, and on a 6% return, and upon your depreciation allowance; is that right?

A. Yes.

Q. Now, before we get into the computation itself, I notice
3362 one thing here, that your annual allowance for depreciation is $245,862 and the interest on it amounts to only about one-third of that; how did you compute the interest?

A. Six per cent compounded.

Q. Now then in your other computation here, your interest amounts to $437,441 against the depreciation charges $392,362.

A. Yes.

Q. The difference I suppose is due both to the difference in the rate and time?

A. Yes, and the amounts being larger.

Q. Now you have a column here, net revenue, allowing six cents per thousand cubic feet on sales; how did you get that column?

A. That is the gross revenue shown by your books, except where adjusted in the last five years, less operating with six per cent added for depreciation.

Q. Give me the items that go into $36,351.

A. I can't give you that off-hand.

Q. Did you make the computations?

A. I had them made.

Q. Have you ever seen the items?

A. Yes, in the rough.

Q. Where are they—the reason I ask this, I went over it and it did not check exactly, I wanted to see where my difference was.

A. It does not check with Mr. Hagenah, I know, but I can give you the computations, I think.

Q. You take December 31, 1896?

A. If you take page 29 in this report, we have there the total revenue and total expenses

Q. Well, let us take this one and see what your revenue is for 1905?

3363 A. The revenue is $369,375.

Q. Put that down, will you please.

A. Yes.

Q. Now what is your operating?

A. Including depreciation?

Q. No, without it; your revenue is given on page 19 $127,527 isn't it; that is, your net revenue?

A. It is page 29.

Q. Yes. Your operating you have there, including depreciation is $241,848.

A. Your depreciation is $20,064.

Q. Take your operating, including depreciation on page 29, $241,848. and subtract it from $369,375. and that gives you what?

A. $127,527.

Q. Is that the way you get at these figures in this Exhibit 33?

A. Yes.

Q. You couldn't get all of them—yes, you could from that table there?

A. Yes. There are slight variations with Mr. Hagenah's report, I know.

Q. What are those variations due to?

A. I cas't answer that off-hand. As a matter of fact we investigated to find out what they were, but were not entirely satisfied where he got his figures.

Q. Take the first year here, ending December 31, 1895, and you had a total revenue of how much?

A. $95,412.

Q. That would be $36,351.

A. Yes.

Q. Now by this computation here you get an investment
3364 value before you deduct your depreciation, what you call an investment value, of less than you compute the actual investment after you deducted depreciation?

A. Yes.

Q. What is the purpose of this table—you get a result of $941,268?

A. The purpose was to demonstrate the absolute fallacy, in my judgment, of the Wisconsin theory.

Q. That is assumed, that the Wisconsin theory makes such deductions?

A. Assuming it is unsound, but that it permits you to capitalize the deficiency of six and credit your excess over six.

Q. The next table is the same thing on a seven per cent basis?

A. Yes.

The MASTER: Will you tell me what the amount at six cents per thousand cubic feet of gas allowance for depreciation would be?

A. $245,800.

The MASTER: I am talking about this one; I wanted it for the year ending December 31, 1895.

A. $3,666.

The MASTER: Is that the amount of gas for that year?

A. At six cents.

Q. How many cubic feet of gas was there that year?

A. 61 million feet, in round numbers.

The MASTER: How much was it for the next year?

A. We allowed, $4,586. On pages 17 and 18 of the report they are all figured out.

The MASTER: I notice that makes a difference of $6,000 in the first year between you and Mr. Hagenah; the next year you get it over $3,000 more than he has it?

A. I don't know that I follow you.

3365 The MASTER: Well, it is not material.

Q. Now, your next table is the same thing on an 8% basis?

A. Yes.

Q. And to summarize, on Exhibit 33, as I understand it, your purpose is simply to show that it don't mean anything; that it is unsound?

A. No, I think this is a sound way of applying the theory, but I do not approve of the theory.

Q. That is the purpose, to show that the whole thing is unsound?

A. Yes.

Q. Turn to this chart in your report; this dotted line represents the return, does it not?

A. Yes.

Q. And that shows that since 1908 the rate of return has been going down?

A. Yes.

Q. It also shows radical variations in the rate of return?

A. It does, yes.

Q. It shows that while the revenue from the sales of gas has been gradually increasing, and the sales have been increasing pretty nearly on a uniform curve, there have been marked variations in the return during this same period?

A. Yes.

Q. The fact that the return does vary in this way and that it does not seem to follow any fixed relation to either the sales or revenue from the sales of gas, indicates that there is more or less instability in the business, doesn't it?

A. Or that you have been extending your plant quite extensively.

Q. Take your investment in the plant, that investment increases by a curve as compared with the return, the curve is uniform?

A. Yes, compared with that it is.

3366 Q. For instance, you take this return curve, in 1895 it runs down?

A. Yes.

Q. Then from 1896 to 1898 it runs up?

A. Yes.

Q. Then during the year '98 and '99 it runs down?

A. Yes.

Q. The next year it runs up?

A. Yes.

Q. The next year it runs down a little?

A. Yes.

Q. The next two years it runs up?

A. Yes.

Q. And the succeeding year, 1904, it runs up very decidedly?

A. Yes.

Q. In 1905 it runs up just a little?

A. Yes.

Q. In 1906 it drops as decidedly as it ran up in 1904?

A. Yes.

Q. Then in the next two years it runs up again to 1908?

A. Yes.

Q. From 1908 it has been running down steadily?

A. Yes.

Q. Now, then, during that same period your investment has been increasing by a relatively uniform curve, hasn't it?

A. In the last five years it has made quite a decided jump, but relatively to the drop it is about right.

Q. That curve as compared with the return curve is relatively uniform?

A. Yes, it is not much out of the way.

Q. During this same period the gas sales and revenue have
3367 been increasing on the uniform curve?

A. Yes.

Q. Don't these facts indicate that there is more or less instability in this business?

A. No, I wouldn't go quite as far as that. You might reason from this last curve that the operating expenses took a very decided increase here, which would explain the drop during the last two years in net revenue.

Q. If you take a line, beginning in 1898, take a rule and run it across here to the operating, at the end of 1910, you will find that if you made that an absolutely uniform curve, projected it over 1907, it would hit right where it is now, wouldn't it, or a little above where it is now, on a uniform basis, starting from 1898 and going through 1907, and projecting it?

A. That would seem to be right.

Q. Now, then, where you have a business where the return varies as radically as is shown by this chart here, in the business of this company, and where it appears that for the last two years the tendency has been downward, you have got to make some allowance in order to make a conservative or reliable estimate as to the income in the future?

A. You cannot accept any chart without considering all the circumstances and conditions.

Q. That don't answer my question. You must where there are variations to that extent in the return, where it is not a uniform return, like interest on a note or something like that, take these variations into account in making your estimates for return.

A. Your variations have to be considered.

Q. You cannot assume that you have a regular return in the future where the history shows that in the past it has been irregular?
3368 A. I would not assume the high peak for judging the future.

Q. You would assume there had to be some give and take there?

A. You have got to have give and take in fixing any rules.

Q. You could not run this business, could you, or it would not be on a sound basis if you ran the business on the assumption that it was going to take every dollar that you earned to pay your interest, operating expenses and your depreciation?

A. I should say the stockholders would want something.

Q. Suppose you had a proposition that showed it would pay 8 or 10 or 6 per cent, or whatever per cent you would want on your invest-

ment, plus your expense and your depreciation, that would take $100,000, and you had a business that earned just a $100,000 and did not earn a dollar of surplus, that wouldn't be a satisfactory business?

A. I should not care to run it that way myself.

Q. In other words, to put the thing on a sound basis, you have got to have some margin over that?

A. You have got to have a margin in any business.

Q. If you don't, you are insolvent?

A. You will get there some day.

Q. Now, I want to call your attention to Complainant's Exhibit 57. In the first place, in order to avoid any misunderstanding, I will say there is a memorandum on this "Hall Exhibit F" and is simply for the purpose of calling attention to one of the exhibits to your report, and you are not expected to assume any responsibility for it. Referring to this Exhibit 57 I will ask you to look at Exhibit F of your report and state whether this Exhibit 57 correctly shows the average working capital of the company for the five years covered by that Exhibit F, not deducting the accrued interest and taxes and shows that to be $197,292.97?

3369 A. Will you accept yes, subject to the fact that I check it out.

Q. I have no objection to doing that, if we may offer it now and any corrections that may be desired will be suggested afterwards, so that the burden is not on us to show that it is done.

A. That is all right.

Q. Now, then, if we deduct the accrued interest and accrued taxes the actual working capital which the company has employed in its business during the last five years would average $197,229.97.

A. It does not say that here.

Q. That is the fact, isn't it?

A. You have not deducted anything for accrued taxes and interest in this statement.

Q. I meant the question to show they had not been deducted.

A. Subject to the exclusion of these factors, yes.

Q. I wish you would look at Exhibit 58 which also contains a reference to Exhibit F of your report, as the source from which it is obtained, and look at your report and check that over and tell us whether that shows the average working capital that this company has used for the last five years upon the basis upon which you have computed the working capital, at $68,000; I would like to have you check this now.

A. There is something wrong with some of these figures, in your current liabilities and bills payable, it does not foot, that statement.

Q. Let us take it up: it is $1,407,052.77?

A. Yes.

Q. And the average $229,410.55?

A. Yes.

3370 Q. Now, then, you say the current liabilities and bills payable do not check?

A. Yes, there is a difference in it. If you substitute my figure

for your figure your statement will foot all right. I think it is a mistake in insertion.

Q. What is your figure?
A. $160,902.92.
Q. And do you get the same total $538,512?
A. Yes.
Q. So that it is evidently a mistake in copying?
A. A clerical error.
Q. Then the average is right $321,858?
A. Yes.
Q. Then the result is correct, $121,708.13?
A. Yes.

Complainant offers and reads in evidence Exhibits 57 and 58.

Mr. BYERS: We object to Exhibits 57 and 58 because they are incompetent, immaterial and not cross examination, and the tables are based upon assumptions not in the record and for which no foundation or basis has been laid, and not the best evidence of what is claimed to be shown by the exhibits.

Said Exhibits are as follows:

3371 "COMPLAINANT'S EXHIBIT 57.

Des Moines Gas Company.

Working Capital, Including Current and Working Assets and Current Liabilities Less Bills Payable.

(Hall Exhibit "F")

	Total 5 years ended Dec. 31, 1910.	Average.
Materials and Supplies	$ 636,257.52	$127,251.50
Accounts Receivable	261,177.75	52,235.55
Bills Receivable	712.50	142.50
Cash	248,905.00	49,781.00
Total	1,147,052.77	229,410.55
Current Liabilities Less Bills Payable	160,902.92	32,180.58
Total	$986,149.85	$197,229.97

3372 "COMPLAINANT'S EXHIBIT 58.

Des Moines Gas Company.

Working Capital Including Current and Working Assets & Current and Accrued Liabilities.

(Hall Exhibit "F.")

	Total 5 years ended Dec. 31, 1910.	Average.
Current & Working Assets.....	$1,147,052.77	$229,410.55
Current Liabilities Less Bills Payable	160,902.92	32,180.58
Bills Payable	101,635.47	20,327.09
Accrued Liabilities	275,973.75	55,194.75
	$ 538,512.14	$107,702.42
Total	$608,540.63	$121,708.13

3373 Q. Mr. Hall, in view of the objection to Exhibit- 57 and 58, that they are based upon assumptions not shown by the record and not proven here, I will ask you to state whether in checking them you found they are based upon Exhibit F to your report Exhibit 33?

A. They are the totals of certain items.

Q. The figures appearing in Exhibit- 57 and 58 and the totals there are taken from your statement Exhibit 33 of the results of the operation of this Company?

A. Yes.

Q. And you have checked Exhibit 57 with Exhibit 58?

A. Yes.

The defendants here again interpose the same objection to Exhibits as offered.

Q. I meant to ask you, and to be understood in asking you whether you checked it at the same time that you checked Exhibit 58?

A. I did.

Q. Now, referring to Exhibit A in your report which shows the income and profit and loss for the five year period, that is not as the books show it, as I understand it; but there are certain changes made?

A. Yes.

Q. And what those changes are nowhere appears in your report, does it?

A. Not in dollars or anything like that. Two of those are mentioned on page 28.

Q. What are they?

A. Tax omitted by the Company $1,287.37; the replacement values and expenses excluded. In the prior page there is a reference made to the accident claims of the two months having
3374 been excluded.

Q. Now is the result or effect of these changes to show a greater or less income than the books show?

A. Somewhat greater.

Q. And none of these expenses that you struck out were either illegitimate expenses or expenses that had not in fact been paid?

A. No, perfectly legitimate.

Q. When you struck out that loss and damage item, for instance, because the accident had arisen at an earlier time, did you go back and charge that against the earnings of the earlier period in figuring our operations?

A. Yes.

Q. Where is that shown?

A. It would be in the year, February 28, 1906.

Q. Is that the year in which the accident occurred?

A. That is my recollection.

Q. Isn't that something that Professor Marks said he was told occurred sixteen years prior to that time?

A. I have no idea what Professor Marks testified.

Q. You didn't find anything of that kind, any charge on account of accident or damage occurring sixteen years prior to this five year period?

A. I do not recall hearing anything about that matter.

Q. Do you know anything about it?

A. Not a thing.

Q. You say you don't recall; what I want to get at is whether you ever did know?

A. I may have, I don't know.

Q. You did not investigate it yourself?

A. No.

Q. Do you know whether this amount that you deducted here in 1906 was that the year for which the deduction was made?
3375 A. I moved the charge back from the two months to the prior year and included it as an expense there.

Q. Are you sure about that?

A. That is my recollection.

Q. You didn't do it yourself?

A. I didn't do it myself.

Q. Have you ever looked—do you know anything about it?

A. I know the charge was moved back on my instruction.

Q. Was it moved back to the time when the accident occurred?

A. My recollection is, to the year preceding.

Q. Was that the time the accident occurred?

A. I don't know when it occurred.

Q. Then it was wrong to put it in the year preceding?

A. I wouldn't say it was wrong.

Q. Just as a matter of practical book keeping, what would the Gas Company do if a man was injured, say today, and he brings his suit in six months, and it is settled, say in eighteen months after that; now how would they get that on the books?

A. Good book keeping would dictate that a reserve should be set up each month to cover such risks.

Q. How would they get this accident on the books as of today?

A. They cannot get the accident on the books until such time as they pay the claim.

Q. That is right?

A. That is proper.

Q. It is rather impossible to do it in any other way?

A. There is usually a record kept in the office of claims in big corporations, of what they anticipate is going to happen.

Q. What I want to get at is how the Gas Company could
3376 do what you say it ought to do here as a practical proposition?

A. The practical proposition in my judgment is to set up the item each month on the basis of business done, charging operations with the amount and crediting the reserve with accident and damages.

Q. How much ought that to be?

A. Your books have a cent for 1911.

Q. By the way, when you made the estimates for our guidance in the future, did you make such an addition to the pers, the cost of gas per thousand?

A. Yes.

Q. That would have decreased your return to that extent?

A. To that extent.

Q. The matter I referred to in Professor Marks' report was this: on page 84 he has total operating expenses for the five years as per the company's books $1,466,821.22. I wish you would give us the total operating for the years as your report shows them corrected?

A. Do you wish the miscellaneous sales separately?

Q. Where is this?

A. In Exhibit "A".

Q. Give it to me both ways?

A. It is on the first page there.

Q. You have your total operating what?

A. $1,452,870.25.

Q. Is that before or after you deducted these miscellaneous sales?

A. Before.

Q. Now when you deduct your miscellaneous sales, it is what?

A. $1,451,850.94.

Q. Now it is stated here in the report of Mr. Marks on
3377 page 84, accidents and damages 1893, $3,685.17. Now is that the item which you deducted?

A. It seems to me the amount in dollars and cents.

Q. I understood Professor Marks to tell us on his examination, though it is some time ago and my memory may not be accurate, that he obtained the information from you or your assistants as

to this item, and the date of the accident—will you get us the date of that accident.

A. Yes.

Q. Was there any reason for pushing that back from 1906 to 1905, assuming the accident occurred in neither year, except to get it out of the operating for this five year period and so reduce that operating?

A. The intention was to get that operating for the five year period as nearly as possible accurate.

Q. You know, if you took out actual payments on account of the loss and damage and did not add some percentage to take care of that, your result would be inaccurate and too low?

A. I have so stated. I think I explained before that I made inquiries about your outstanding claims but got no information.

Q. Did you personally make those inquiries?

A. I answered a few days ago, no. I have since been told I did.

Q. So far as this testimony is concerned, you have no recollection of having made any inquiry of anybody?

A. I have no recollection of having done anything at all——

Q. You have no recollection of having made any inquiry of anybody?

A. Except of my own assistants.

The complainant moves to strike out the testimony of this witness as to these inquiries as being purely hearsay and secondary.

3378 Q. Now, I wish you would find out for me and let me know when we come in here this afternoon, if you can, just when this accident occurred, and also to just what year you added this amount as operating expenses?

A. Yes.

Q. Now turn over to the next table; that is the same thing, Exhibit B, as Exhibit A, except stated in a different way?

A. Yes, sir.

Q. That is, this is the result stated in cents per thousand cubic feet of gas sold?

A. Yes.

Q. Now does this revenue from gas that you have here, does that include Valley Junction or not?

A. Yes.

Q. Of course, this table will show the same variations from the books that there is in Exhibit A?

A. Yes.

Q. Because it is founded on Exhibit A?

A. It is founded on Exhibit A.

Q. This interest on floating debt, less interest received, there are two items in red, those represent periods where the interest received was more than the interest paid?

A. Yes.

Q. Now I will skip Exhibit C, which I think you compared with our statement covering the same matter?

A. Yes, that is prepared from your statement.

Q. There is a variation of 25 cents in the five years, but we will

let that go. Now, then, take Exhibit D; that is a statement of the cost of manufacturing and distributing gas, and that is again not the actual cost, but the cost with the deductions which run
3379 all through your work?

A. Yes.

Q. The red items here are profits?

A. Yes.

Q. And are deducted from the cost?

A. Yes.

Q. Now your next statement, Exhibit E, which purports to be the cost in thousand feet is predicated on the one that precedes it, I suppose?

A. Yes.

Q. Through Exhibit E are carried the same variations from the books which appear in the preceding exhibit?

A. Yes.

Q. Now, then, your balance sheet Exhibit F, how does that vary from the books, if at all?

A. That only varies from the books by the entry of $264,108.78 reve-sed for these periods, that is, added to the investment account and also added to the surplus. In other words, that is how your books would appear had that entry not been made.

Q. It did not affect your general results here, as I understand it?

A. Not at all.

Q. Why did you reverse it then?

A. There didn't seem to me to be any particular basis for the entry.

Q. I thought you said it wouldn't affect the result?

A. It would not affect the result except in those two accounts, the surplus and your plant.

The MASTER: Is that credited to the profit and loss account?

A. No, sir; the profit and loss account was charged with that amount and credited to the plant account to reduce it.

Q. So the result of your change was to increase our sur-
3380 plus $264,108.78, and increase the value of the property as shown on the books by the same amount?

A. Yes, sir.

Q. Now have you adjusted the surplus to take care of the changes you made in the operating expenses and things like that?

A. No.

Q. Then, of course, this balance sheet won't check with your operating results?

A. Not by those two differences, the replacement values and the federal tax, shown on the previous page.

Q. And interest and accident or damage and what else?

A. That is all I recall.

Q. In fact you don't know exactly how you did do it?

A. Oh, yes; I have a pretty fair idea.

Q. In your schedule 1 you gave the quantity of gas manufactured, and that is simply historical, and used also in making some of these computations?

A. Yes.

Q. Where did you get the information for this schedule?
A. From the records of the company.
Q. Well, be a little more specific; what records contain this information?
A. The records of gas manufactured sold and used by the company.
Q. What books show that?
A. I don't know.
Q. What did you call is, did you ever see it?
A. I saw the book one day; I saw some book on that subject.
Q. Do you know whether you got this from the books or took it from our statement?
A. I can't answer that. They were got out of your office.
3381 Q. You don't know whether they were worked up from the books or whether you accepted our statement?
A. I don't know, and I am rather indifferent.
Q. You haven't found any statement that we furnished you to be inaccurate?
A. Your statements are very accurate in as far as they go.
Q. Now this next schedule 2 is a comparative monthly statement of the quantity of gas accounted for and unaccounted for for the five year period; do you know where that came from, whether we furnished it to you or came off of some of the books?
A. It came off of some of your records.
Q. We furnished it to you or got it from the books?
A. I don't know; I would be glad to accept your statement of it.
Q. Now what do these figures in red mean in schedule 2?
A. An adjustment of the gas connected with the meter reading of the manufacture.
Q. That is not clear to me. Take this lower set of figures and it shows the gas unaccounted for?
A. Yes.
Q. In September, 3,211,438 feet, in red?
A. Yes.
Q. What does that mean?
A. I mean that month you sold more than you manufactured, or read meters for more than you manufactured.
Q. And it shows that somehow there was a surplus in gas somewhere?
A. Somewhere, yes.
Q. Can you explain that?
A. I am afraid I cannot go into that technically.
Q. Now, I wish you would turn over to schedule 6, headed, data relative to standard prices paid by the Company. What
3382 significance do you give to the word standard?
A. That would mean ordinary current prices paid by you during this period.
Q. Ordinary current prices?
A. Prices paid by you under the date mentioned, whether under contract or arrangement.
Q. Take oil for instance, did you put down the standard price for oil 2.8 per gallon?

A. That was the price under the contract.
Q. Under the contract of 1905 it was 4.4 per gallon?
A. About that.
Q. In 1906 4.5 cents?
A. Yes.
Q. In 1907 it was 4.55?
A. Yes.
Q. In 1908 it was 3.1 cents?
A. Yes.
Q. And then they made a three year contract at this minimum price?
A. Yes.
Q. So that you have not taken the average price, but the lowest price?
A. This does not purport to show the average price.
Q. Is it present prices or latest prices or lowest prices?
A. The latest price under this purchase.
Q. Take coke and we have the lowest price of coke for the last three or four years given by you?
A. Yes.
Q. Coke cost in 1909, 6.15 including freight?
A. Where do you get your figures?
Q. I didn't get them from your report.
A. I can't tell you anything about that.
3383 Q. You did not attempt then to give anything like an average price?
A. No, we got the price of this time, December 31, the last invoice under these items, irrespective of whether high or low.
Q. This would not afford any basis for determining the cost during the five year period?
A. No.
Q. And it would not be a reliable estimate to be based on the future prices?
A. It might assist in getting a reproduction value on the present price.
Q. You think in order to get the reproduction value as of December 31, 1910, you would take the price from a single invoice that happened to be the latest one without reference to what would be a fair price for a reasonable period of time?
A. If you were reproducing as of that time, you would be quite justified in taking the current market price.
Q. You think that would be a reasonable way to get at it if you were going to reproduce this plant and make an estimate for me what it would cost me to reproduce it, knowing that it would take me two or three years to do the work, and you would take a single price like that and base an estimate on it?
A. I didn't say so; that is simply a guide, that is all.
Q. It would be a very weak staff on which to put your money in?
A. I would expect the engineer to apply his own knowledge in addition to the price.
Q. You told us you had spent, I have forgotten how much time on

this report, and that the last part of the time was Saturday last week and Monday of this week?

A. Yes, I got a note of the days I spent.

Q. Can you give us the items?

3384 A. Yes, I was in Des Moines June 27th and 28th; I was in Des Moines July 14, August 3rd, August 15th, 16th, 17th, 18th, 19th and 20th. I put in some time in Chicago, running about 18 hours or 20 hours. I came back to Des Moines on the night of September 8 and spent Saturday looking over the various papers I had and spent Monday at the same thing and came here Tuesday.

Q. You did not come to Des Moines on the night of September 8th?

A. I left Chicago on the night of September 8th.

Q. You went to Colfax on the night of September 8th?

A. Yes.

Q. Who went with you?

A. Mr. Sangston.

Q. Who else?

A. Professor Bemis.

Q. Who else?

A. Professor Bemis' stenographer.

Q. How long did you stay in Colfax?

A. All Saturday and Sunday morning.

Q. And Monday?

A. And Monday.

Q. Who was with you there at Colfax?

A. Professor Bemis and Mr. Sangston.

Q. He was going over your report with you at that time?

A. I barely talked to Professor Bemis on Saturday.

Q. And on Monday?

A. I hardly saw him on Monday.

Q. You furnished him a copy of your report?

A. Yes.

Q. When did you furnish him a copy of your report?

A. August 20th.

3385 Q. And how often did you see him after that and discuss it with him?

A. I saw him several times after that; the report was discussed in a general way once or twice.

Q. When did he suggest you make up Exhibit 33?

A. He did not suggest it.

Q. Who did suggest it?

A. My own idea.

Q. When did he furnish you with this copy of the Madison case report?

A. My recollection is after I went back to Chicago on August 20th.

Q. And before you made up this Exhibit 33?

A. Yes.

Q. Have you looked *that* advertising literature?

A. No, I haven't had time to get that out.

Q. Will you do that for us?

A. Yes.

Q. The reason I want you to do it is, you leave it in your report as if it was a suspicious item and I want to know what the facts are?

A. I will do you justice.

Q. I wish you would give me the total sales for this five year period as you computed them?

A. They would be in round figures 2,292,035,000.

Q. That was the basis for the depreciation you charged during that period?

A. Yes.

The MASTER: There are certain rejected items, did you give the total of them?

A. I gave it from the record yesterday.

Q. Where are they?

3386 A. I don't know; the items are in the record; we read them over yesterday.

Mr. BRENNAN: Are they shown in your report?

A. No; the details are all in the record.

Q. Mr. Hall, will you prepare a memorandum showing the rejected items and if there was any provision made for taking them into the operating expenses anywhere else, showing what was done in that respect?

A. Yes.

Q. You referred several times in your testimony and in your report to an item of $131,744.44 which was charged to the plant account and credited to profit and loss and subsequently distributed as a stock dividend May 1st, 1897. I refer to page 3137 of the transcript, and I call your attention to Defendants' Exhibit 26, and in that to the minutes of the stockholders' meeting held December 31, 1896, and to a resolution passed at this stockholders' meeting as follows:

"Thereupon A. B. Cummins offered the following preamble and resolution: Whereas, prior to this meeting the authorized capital stock of the Capital City Gas Light Company was three thousand shares of one hundred dollars each, aggregating three hundred thousand dollars, and

Whereas, the capital stock had been increased by amendment duly passed and adopted to six thousand shares of one hundred dollars each, aggregating six hundred thousand dollars, and

Whereas, the property of this company, real and personal including its rights, franchises, privileges, contracts and immunities is of the fair value of six hundred thousand dollars, after deducting its indebtedness, and

3387 Whereas, the present stockholders are entitled to the said increase of capital stock;

Now, Therefore, be it resolved, that the board of directors is authorized and directed to make a stock dividend of the said increase of capital stock, to-wit, of three thousand shares and to cause to be issued and delivered to each stockholder, according to his holdings as appears from the books of the Company, his ratable propor-

tion of the said increase of capital stock. Which capital stock shall be issued as fully *a*pid and nonassessable. Whereupon A. B. Cummins moved the adoption of said preamble and resolution, which motion was duly seconded by W. B. Keffer and after having been duly considered by the stockholders of the corporation was adopted by an affirmative vote of all the shares of stock. Whereupon the presiding officer declared the said preamble and resolution to have been unanimously passed and adopted."

Q. You had seen that resolution, had you not?

A. I had not. I did not see it myself. I got an abstract of it.

Q. Who furnished it to you?

A. Mr. Sangston.

Q. You had seen this just as you have seen these other things, by proxy?

A. By proxy.

Q. Just as you had seen these other things you testified about?

A. I might just explain for your information, it is impossible for any accountant in practice to do the work other than by proxy.

Q. You notice I have not objected to any of this testimony of yours on the ground that it was secondary. Now I will call
3388 your attention to a minute from the directors' meeting of the same date at which there were present Mr. Cummins, Mr. E. J. Pratt, and read from the record as follows:

"Whereupon A. B. Cummins offered the following preamble and resolution:

Whereas, the capital stock of this corporation has been increased to six hundred thousand dollars and three hundred thousand dollars thereof has not been issued, and

Whereas, the said increase of capital stock has been made upon the basis of the value of the property of the corporation, and

Whereas, the stockholders of the corporation at a special meeting, held in Des Moines, Iowa, on December 31, 1896, have ordered said increase of capital stock to be distributed to the existing shareholders proratably as a stock dividend;

Be it therefore resolved, that the President and Treasurer of the Company be and they are hereby directed to issue the said increased capital stock fully paid up and nonassessable to the existing stockholders in proportion to their present holdings, and to cause such entries to be made upon the books of the Company as will carry into effect this resolution. Upon motion the foregoing preamble and resolution was unanimously adopted."

These two resolutions I have read to you were the authority for the entry that was made and the stock that was issued?

A. Yes.

Q. And they were predicated upon the proposition that the property of the Company was worth the amount of this additional stock, that is, there was value there to represent it?

A. Presumably.

3389 Q. If that is so there was no water in the stock, was there?

A. If the assets were there to represent the $300,000, there

would be no water in the stock, provided you have the tangible assets.

Q. Why do you use the word tangible?

A. Provided you had them.

Q. Will you say the company didn't have them?

A. I don't know; it did not have them according to its books.

Q. Do you mean that? That the books show or purport to show what was the value of the tangible and intangible assets of the company?

A. I would expect to go into your plant account and I would figure what would represent in your judgment the value of your assets.

Q. How could that make that plant account represent the value of the assets as distinguished from their cost, except by either making additions to it as made under these resolutions, or subtractions as were made in the $264,000 item?

A. That is one way.

Q. What other way would there be of making our plant account agree with the actual value except by making additions or subtractions to it arbitrarily in accordance with our judgment?

A. That is not good book keeping.

Q. I ask you this: you said something about the plant accounts representing our idea or value, and how are you going to take care of the difference between cost and value except by some entry?

A. It is not customary in book keeping to take care of cost and *and* values.

Q. Then it is not customary to do what we did?

A. They do it very often, quite common practice.

Q. If they do do it, how are they going to do it except by making such additions or subtractions?

3390 A. You might put it down on the basis of appraisal.

Q. Suppose you took an appraisal—you don't know whether they had an appraisal back of the resolution or not?

A. It would be in the resolution if there was; I don't know anything about it myself; if there was it would be mentioned.

Q. You think it would be mentioned?

A. I think it is almost certain to be.

Q. To get back to my question, I wish you would answer and tell me how, except by making some additions or subtractions from this property account or plant account, they were going to make it show the actual value as distinguished from book cost?

A. Assuming your actual value is more than the book cost, you must make an entry.

Q. And if your actual value is less, you have got to make a subtraction?

A. Yes.

Q. These amounts must be predicated upon somebody's judgment?

A. Yes.

Q. If that judgment is sound or reasonably sound, it is wrong to call it water?

A. If your judgment is sound and you have the assets, I would not call it water, no.

Q. Now, on page 3137, after you refer to some item, you were asked this question: "Q. So that the actual value would be even less than $1,423,953? A. Yes, would be subject to a deduction of $211,468.16 and $134,297.44 mostly making up that appreciation"—you used the words "actual value" there; you didn't mean it, did you?

A. Actual cost as shown by the books.

Q. You didn't mean that there, you mean the actual cost
3391 shown by the books with the additions and subtractions we talked so much about yesterday?

A. Yes.

Q. There is one thing on page 3146 of the transcript—your Exhibit 33 is read in the record here and it is a reconciliation you made at the request of the court of the difference of something like $200,000 and your cost figures and Mr. Hagenah's?

A. Yes.

Q. You took some items aggregating $470,173.66 beginning with $295,383.08?

A. Yes.

Q. That was taken from Mr. Hagenah's statement and was the amount with which he started as the original investment plus the additions down to your statement?

A. Yes, it was an attempted reconciliation between the two ideas.

The MASTER: The table that shows Mr. Hagenah's investment will show it.

A. I might say that was the big table of Mr. Hagenah's.

Q. Now I want to call your attention to something on your direct examination at the bottom of page 3151: The question refers to the salaries paid by the Des Moines Gas Company to officials of the Des Moines Gas Company residing at Philadelphia: "Q. So this whole matter is a matter of book entries, so far as the books here are concerned? A. Altogether, yes." What did you mean by that?

A. These salaries or checks and vouchers are made out in Philadelphia and sent here for signature and returned to Philadelphia and paid out of the funds in the hands of the treasurer. The treasurer in turn sends the entry to the people here and instructs them to put it on the books.

3392–3393 Q. This suggests something more than a mere matter of book entry?

A. Yes.

Mr. BYERS: What I meant by that was simply to show the transaction here of putting it on the books; I don't want myself to have any other inference drawn from that question.

The MASTER: I understood him the next day to make a correction of that.

Mr. GUERNSEY: I am reading from the testimony given the second time.

The MASTER: I understood him to say these warrants were drawn by the Philadelphia office and were endorsed by these officers.

Q. Now, then, if I understand you correctly, the checks are signed here?

A. By Mr. Haines and one other.

Q. Mr. Haines, Manager, and somebody else?

A. Yes.

Q. Now you said the entries on the books are made here when those checks are signed and mailed?

A. As I understand it, the entries on the books are made here when the journal entry comes from Philadelphia.

Q. What information have you on that subject?

A. Just from Mr. Sangston.

Q. The natural way to do would be to make the entries if they were keeping the books here, when the checks were signed and delivered?

A. No I think the natural transaction would be for the Philadelphia office to accompany the checks by a journal entry; at the time of signing the entry goes on the books.

Q. That is the way you think it is done?

A. I take it it is done that way; that is the natural way to
3394 do it.

Q. So that the people here signed the checks and then make their entries at that time?

A. Yes.

Q. There is nothing out of the way in that?

A. That is all right.

Q. Now on page 3152 I find, you had stated that there was an item on the books, talking about the federal tax, I find this: "Q. I wish you would state into the record just what the books show with respect to the federal tax and how the accounts would figure out? A. The books show in 1911 a federal tax covering the fiscal year of 1910 was paid on $128,737.13; at one per cent that tax is $1,287.37. Q. You found the item $1,287.37 in the books, did you? A. Yes, sir; in 1911."

The MASTER: What was that paid on?

A. $128,737.13.

The MASTER: That was the net?

A. The net earnings.

Q. Do you use the expression "net earnings" there in the same sense that we have been using it elsewhere here?

A. No.

Q. If we accepted that as a statement of the net earnings as we have been using it in the case here, that would be misleading?

A. No, that is not used in the same connection at all.

Q. You also said, referring to these taxes on the next page: "I might explain, that was paid under protest?"

A. I think I made that remark in regard to the 1909 tax.

Q. There was nothing either wrong or unusual or abnormal in that?

A. It was good business judgment.

3395 Q. Why did you call attention to it?

A. To give you the benefit of that.

Q. What benefit?

A. You was entitled to the benefit of trying to take care of yourself; a number of people paid it without protest.

Q. Everybody protested?

A. Everybody who consulted me paid it under protest.

At this time an adjournment was taken until 1:30 p. m.

3396 1:30 P. M., FRIDAY, *September* 15, 1911.

JAMES HALL being continued on cross examination by N. T. Guernsey, Esq., testified as follows:

Q. Mr. Hall, you promised to get me the specific description of the real estate which was taken into account by you in making up your figures as property of the company. Did you get that?

A. Yes.

Q. I wish you would take this plat which has been introduced as an exhibit which I believe is Exhibit 5 and shows enclosed in red the real estate owned by the company. I wish you would check the real estate that you took into account and see whether you took in all of it.

A. I am afraid I can't make anything of this plat.

Q. Well give me the description then of the real estate.

A. You had on January 1, 1895, real estate on the books at $8,960.00——

Q. I want the specific list?

A. I can't give the specific list on that.

Q. You can tell from the books?

A. This begins 1895, the tabulation. I know nothing about it before that.

Q. Well can you find out from the books?

A. I can investigate it.

Q. Didn't you go over this real estate and examine the vouc*ehrs*?

A. We accepted the Pratt affidavit as the start.

Q. What did you get after that?

A. February 28, 1897, the land located in Fourth district Des Moines, Polk County, Scott & Dean's Addition comprising Lots 3, 4, 5, 6, 7, 8, 9 and 10 in Block 5.

3397 Q. That is Block B isn't it instead of Block 5?

A. May be.

Q. You are reading the entry from ledger No. 4, folio 154?

A. I don't know where it came from, came from your ledger, which one I don't know.

Q. What are you reading from, one of these memoranda?

A. Yes, I am reading from a typewritten copy of a memoranda.

Q. Assume that is Block B which it ought to be, that date is February 28, 1897 isn't it?

A. Yes.

Q. Let's call that Block D then. Now what is the next property?

A. August 27, 1901, lot 4 in Block T.

Q. What next have you?

A. Lot 3 in Block T same date. These are the only additions except the cost of some curbing and surveying.

Q. That was 1901?

A. Yes.

Q. So you don't show lots 5, 6 and 7 in Block T, you don't take them into account at all?

A. Unless they are included in the original affidavit of Col. Pratt.

Q. Have you a copy of that affidavit?

A. No.

Q. You don't show anything in Block C at all?

A. Not unless included in that first figure.

Q. You don't show anything in Block K?

A. Not unless included in the Pratt affidavit.

Q. Nor in Block M?

A. Same answer.

Q. Will you look and see whether this in Block C, K, M, and Lots 5, 6 and 7 in Block T are included in that affidavit and let us know?

3398 A. Yes.

Q. Now there is an expression that I find here in your direct examination, page 3168 that I want to ask you about. You were asked if there was any significance in the apparent widening of the space between the lines on this chart of yours showing the operating expenses and gross revenue, the question and answer being as follows: "Q. What if any significance is there in the apparent widening of the space between these first two lines as you go up? A. Considerable dumping in of expenses in the year 1909 and 1910, especially 1910. The ratio of the sales appears to have been narrowed down." Now what do you mean by the expression dumping in? You mean to convey the impression of some illegitimate expenses there?

A. No, I do not. Quite willing to modify that to exclude any illegitimate expenses. I didn't intend to convey that impression.

Q. It is rather a peculiar way of referring to legitimate ordinary expenses?

A. Well it is perhaps a little rough on you.

Q. And that is not the way you intend it——

A. Oh I didn't intend to make any offensive remark about your expenses or hurt your feelings in any way.

Q. Now as a matter of fact as the business increased in volume you would expect the lines on the chart indicating gross revenue and operating to separate wouldn't you.

A. They would, yes.

Q. And that would be true if the ratio of profit remained the same?

A. Yes.

Q. And might be true if the ratio of profit was run down?

3399 A. Yes, might be to a modified extent.

Q. If it did not decrease fast enough to keep up with the increase of the business.

A. Yes.

Q. Now I want to call your attention to your direct examination on page 3174, this question and answer appear there at the top of the page "Take the bookkeeper for instance, where did he get his memoranda or data or facts or figures to go upon the books of the company here? A. They appear to come very largely from Philadelphia." Now did one per cent of the entries come from Philadelphia?

A. I could not put a percentage on it at all. I do know that the important items connected with the sale of bonds or anything of importance, officers' salaries and so on, came from Philadelphia. I would say quite a fair proposition.

Q. You say they appear to come very largely.

A. Well I regard these important items, I don't include ordinary routine work of the business, you would expect to get that here.

Q. What you mean is the unusual items?

A. I modify the answer to that effect.

Q. Would you expect the bookkeeper to enter up these unusual items without specific directions from somebody who is an officer of the company?

A. I would not.

Q. And where if the officers of the company live in Philadelphia where would be the normal place for these entries to come from?

A. I would expect to get the bulk of the entries O. K's by your local manager.

Q. As to sales of bonds for instance, where the home management did not make the sales?

3400 A. No, that would come — Philadelphia.

Q. Now a bookkeeper is like an ordinary human being in this at least isn't he, that he don't know what to put on the books, unless somebody gives him the information?

A. He should put nothing on the books without getting information.

Q. And the natural and proper source for the information would be from the officers of the company who knew.

A. Exactly.

Q. Now then take bond sales for instance you referred to them. Did you know that the trustee under the trust deed was in Philadelphia?

A. Yes.

Q. And you knew the bonds would be certified from time to time by the trustee?

A. Yes.

Q. Under resolutions of the board of directors?

A. Yes.

Q. It is the usual method, the only method I guess?

A. It is the correct method.

Q. You knew that the board met in Philadelphia?

A. Yes, I assume they did. I don't know, I assume they did.

Q. And the bonds would naturally be delivered to the treasurer there?

A. Yes.

Q. Now where would you expect under those circumstances that the information would come from as to these entries as to bonds?

A. Come from Philadelphia.

Q. The only place it could come from?

A. Of course it is where the transaction originated, must
3401 come from there?

Q. So there is nothing wrong about that is there?

A. No, with the one modification perhaps I thin'k the entry might be a little more full than they are?

Q. Well we get to that. Now the next thing you refer to is contracts for materials and supplies. You found here copies of the contracts didn't you?

A. Yes.

Q. You found here canceled checks that had been given the tracts?

A. Yes.

Q. They agreed with the contracts as to prices?

A. Yes.

Q. You found here canceled checks that had been given the people who furnished the material?

A. Didn't examine them.

Q. You could have examined them if you wanted to? contracts wouldn't he?

Q. The ordinary man would be satisfied with going that far on contracts wouldn't he?

A. I don't know if he would.

Q. You don't?

A. No.

Q. How much further would you go?

A. There is always a suspicion, Mr. Guernsey on the subject of contracts, special discounts on them are known, met with them quite often in the ordinary course of business and got to be rather suspicious of them.

Q. The concerns you have been connected with then have been engaged in that prpactice?

A. I have met the practice quite often.

3402 Q. So that you would like to see whether there was some special discount?

A. Oh I would have a doubt occasionally about it.

Q. How is that affected by the situation here. You of course could go for instance, take the oil you could go to the books of the standard oil company and see whether they were paying anything back?

A. Yes, you would have a hard chance of getting them.

Q. With reference to these contracts was there anything suspicious in the price?

A. Nothing.

Q. Was there any suspicious circumstance in connection with them so far as you know?

A. I saw nothing to indicate anything at all except the natural suspicion I would always have of contracts.

Q. You would assume that therefore they are dishonest?
A. No, I am not assuming that, but it is wise to look into the matter usually.
Q. Referring again to the entries on the books that you mentioned, what entries were meager?
A. The entry relative to the sale of the bonds was somewhat meager.
Q. Now what did you find on the records of the directors as to the sale of the bonds?
A. I never seen them.
Q. They could not be sold without—could not be issued without some action of the directors?
A. Oh they were authorized by the directors.
Q. You don't know what these records showed then?
A. No.
3403 Q. You don't know that there was a directors' record as to each additional bond issued.
A. I know they were all authorized.
Q. That is you know because somebody told you?
A. No. I know because your entries states they were authorized at a specific meeting of the board of directors.
Q. The books show—the entry on what books?
A. The entry of the instructions from Philadelphia.
Q. The books show the amount of the bonds issued?
A. Yes.
Q. They show what they sold for?
A. Yes.
Q. They show the treasurer is charged with the proceeds?
A. Yes.
Q. They show something with reference to discount?
A. Yes.
Q. Now what additional information is ordinarily shown on such a set of books as to the sale of bonds?
A. As to who bought the bonds.
Q. That is shown by the books?
A. The whole record of a transaction of that kind should be on the books.
Q. The name of the purchaser of the bonds is usually put on the books when a bond sale is made, is that right?
A. Yes, my experience.
Q. Now give us some corporations that keep their books that way?
A. I don't think I am called upon to do so.
Q. Can you give us one?
A. I could if I would.
Q. But you won't?
3404 —. No, I won't.
Q. Could you give us two?
A. Yes. But that is a question of privilege and I am not going into it.

Q. So the only objection you make to these accounts is they don't show the name of the purchaser of the bonds?

A. Yes, sir.

Q. The prices don't look out of the way?

A. No comment on the price at all.

Q. It is simply your natural suspicion that leads you to suggest that the name of the purchaser ought to be on the books?

A. No suspicion about it, simply stating a fact.

Q. All that you have in mind when you say that the entry might be more full is that it might have shown the name of the purchaser of the bond?

A. Yes, that is one of the important items connected with a bond.

Q. Suppose they sold the bonds through a broker and don't know who the purchaser was?

A. You know the broker.

Q. Usually bonds that are sold through a broker are sold to a purchaser and you don't know who the purchaser is?

A. You know N. W. Harris & Company or whoever it is?

Q. Suppose they are sold through a broker?

A. You know the broker. All you have got to do is where you put them through the broker that is the end of the transaction.

Q. Do you think it would materially affect, the person who happened to buy these bonds would materially affect the value of this plant or amount of its earnings?

A. Would not affect it at all.

3405 Q. Not in the remotest degree?

A. Not at all.

Q. Now somewhere as I recall it, you said in your direct examination didn't you that the treasurer's account was kept in Philadelphia and you didn't have access to it?

A. That is, was in Philadelphia with their records here.

Q. The account is kept here?

A. Account is kept on the ledger here, but the treasurer in Philadelphia keeps a separate account.

Q. He sends the entries here so that the two accounts correspond?

A. Well they should.

Q. So that if the books balance what you could have ascertained by looking at the other accounts you could find here.

A. If the current accounts there are off balance you could not find it here?

Q. They were in balance weren't they?

A. I don't know.

Q. Didn't you look to see?

A. No.

Q. Did you find any indication the books were not in balance?

A. I did not.

Q. As a matter of fact you found they were very well kept as you said?

A. The books are very well kept, yes.

Q. You were asked this question after you stated the treasurer of

the Des Moines Company sends the entries through to Philadelphia —that should have been from Philadelphia?

A. Yes.

Q. Then you were asked the direction is from an officer of this company who is in Philadelphia who is also one of the officers
3406 of the United Gas Improvement Co., and you said I understand he is. If it turned out the United Gas Improvement Company owned the stock of this company do you think there would be any impropriety in their being company officers?

A. I didn't offer that suggestion at all.

Q. Be the most natural and proper thing in the world?

A. I would rather expect to find the same men on both boards.

Q. That is what people usually do isn't it?

A. As a rule it is my experience.

Q. Now you referred to these bonds, some of them sold in earlier years at a discount of 10 per cent and some sold later at a discount of five per cent. What rate of interest did they bear?

A. Five.

Q. And after referring to everything here in detail your attention was called to a good many accounts or to a number of accounts or entries that were made pursuant to instructions from Philadelphia. None of those instructions so far as you know involved any impropriety?

A. None at all.

Q. You called counsel's attention to the fact that these entries were so made didn't you?

A. Were made on instructions of Philadelphia?

Q. Yes.

A. I don't recall whether I did or not. I will accept the responsibility of doing so.

Q. Counsel who examined you didn't examine the books or accounts did he?

A. No.

Q. You did examine the books?

A. Yes.

3407 Q. You gave them this information?

A. I or some of my assi-tants must have given it. I will accept the responsibility of giving it any way.

Q. Could not have been any purpose to bring it out except to sort of try and create a suspicion or something could there?

A. Oh no, I don't think you are just giving me a fair deal there Mr. Guernsey.

Q. Then it was the purpose to emphasis this matter so much and in the way in which it was emphasized if as you say it was entirely proper.

A. Don't you think it is fair to counsel that he should know all the facts connected with it and how business is done?

Q. Well yes, but my experience is that a witness calls counsel's attentuon to the material things.

A. Well I regard that as quite material.

Q. From which point of view is it material, for no other purpose

except to rather suggest some doubt about the transaction that we have to remove on cross-examination.

A. Not at all. I am not offering any suggestions about your transactions. I am simply doing what I am paid to do, advise counsel in the matter as to the position of affairs. That is all of my whole connection with it.

Q. Now you said with reference to some bonds sale that you could not tell what they did with the money, it simply went into the same pot. Is it usual in keeping the books of a corporation to trace the receipts so that you can tell for what purpose each identical item of receipts is disposed of?

A. You could not tell from any set of accounts.

Q. No of course not. Now referring to this bond sale again, you say in answer to the question this bond sale, how is it entered
3408 on the books up here and you answer entered as a straight bond sale and the proceeds charged to the treasurer and to the question just simply charged to the treasurer you answer yes and then the question to ascertain exactly what was done with that you would have to go to the books in Philadelphia, and you answer yes. Now do you think the books in Philadelphia would trace that particular fund, say they got a thousand dollars here and paid that thousand dollars out for that?

A. No set of books would do that. I didn't intend to convey that idea, if I did I didn't mean to.

Q. I have simply read what you said.

A. I didn't intend to convey that idea at all.

Q. Now you said this, page 3184, what do you have to say about anything like an intelligent examination or investigation of these books or papers being made in say five or six days. A. Well I would not take much stock in it myself. I would not place much value on it myself, personall- I could not do it. Now just what do you mean by that?

A. Practically what it says that you could not examine the books and accounts of this corporation in five or six days and do the subject justice.

Q. Could you examine the books and take what the books show?

A. You could accept the figures from the books in a modified extent in five or six days.

Q. How would you have to modify them?

A. You could get al- the books showed in five or six days, might get some if it.

Q. You could in five or six days very readily take the figures from the books as to the plant account or property account of this company couldn't you?
3409 A. Not in detail and by years. You could take the total figure off very easily.

Q. You could take the total off in a minute or two?

A. Oh a few minutes you could do that, but could not make any analysis in five or six days of that kind.

Q. That is what you mean, you could not take and check the figures and analyze the accounts is it?

A. Could not even analyze the account without checking the figures in five or six days.

Q. What do you mean by analyze?

A. Could not go over that account to ascertain by classes the extensions by years and by divisions in five or six days.

Q. What do you mean by ascertaining the classes of extensions and divisions?

A. Could you get an analysis of that account stating the extensions put in in years and in classification, the extensions of mains, meter service or anything else.

Q. Do you know of anybody attempting to do that in five or six days?

A. I have not suggested anything or attempted to do so, simply said I would not do it, would not attempt to.

Q. But you could go to the books and find out how much was invested in the plant as shown by the books without auditing it or analyzing it in a very much shorter time?

A. Oh fifteen minutes take your balance on the books, about fifteen minutes.

Q. That would be what the books showed?

A. That would be what the books showed in total.

Q. You could get at the end of each year what they showed at the end?

3410 A. Take the total at the end of each year.

Q. Very readily.

A. Oh take some little time.

Q. You said on page 3194 with reference to the U. G. I. Co., I see no record of their charging anything in respect to auditing, but they did make charges in respect to advertising service, engineering service, rate regulation expense and a few things of that kind. Now what advertising service did they charge for?

A. I have not got that information for you, I was going to get tha- information for you, but I have not got it yet. I promise to get an analysis of that account and I will get it for you.

Q. Were there any engineering services charged for aside from those in this rate regularfion?

A. My recollection is yes. I will verify it.

Q. And the few things of that kind, what are they?

A. I will tell you all about it tomorrow.

Mr. GUERNSEY: I believe that is all with the exception of the things the witness was to furnish.

Redirect examination by Hon. H. W. BYERS.

Q. What did you mean in your response in your examination in chief where you said that to get a complete record of these transactions you would have to get the Philadelphia books at Philadelphia?

A. You refer to the bond transactions?

Q. Yes?

A. I thought an examination of this company would

3411 involve an examination of the treasurer's account in Philadelphia.

Q. Now Mr. Guernsey asked you if the two accounts ought not to agree and you said yes they ought to. Is there any way you can tell by an examination of these books here whether they do agree or not?

A. You can't tell by an examination of one set whether it agrees with the other.

Q. Your answer as you gave it was made because of the information that you did have from the books here and the testimony that has been given already in this case that all of the stock of this Des Moines Gas Co., is owned by the U. G. I. and that the officers, the principal officers reside in Philadelphia and are officers of the U. G. I. and the testimony that there is a separate set of books in Philadelphia, is that right?

A. Yes.

Q. Mr. Guernsey asked you if you did not find vouchers here and oil contracts and other things of that kind. You did, but it does not follow does it that the vouchers show the real transaction?

A. Not always.

Q. The truth is that the books here do not show the truth in many respects as you have ascertained, isn't that so?

A. Would you mind specifying a little more, I don't follow you.

Q. Take this question of salaries for instance, the books here do not show the truth about that do they?

A. My understanding is no, they do not.

Q. Now they went through the form of making out vouchers in the name of each of these individuals just exactly the same as though they were getting their pay?

A. Yes, sir.

3412 Q. And that was too right at a time when the U. G. I. did have an account with this company didn't it?

A. Yes.

Q. That is to say there were other items in the books showing an account with the U. G. I.?

A. Yes.

Q. So that it does not follow at all because you find a copy of a contract here that has been sent here from somewhere else where another set of books relating to the same concern is kept, it does not follow that the contract shows the whole transaction.

A. I am sorry to say it does not.

Q. Been your experience very many times it does not?

A. I have found what are called special discounts quite often.

Q. You were asked about the real estate. All the real estate entries that you took from the books correspond with the entries as Hagenah has them in his sheet?

A. I don't recall what he has in his sheet at all.

Q. Anyway you figured out his sheet to ascertain the difference and you did not find any difference in real estate?

A. No, our results agree substantially barring the differences pointed out.

Q. Your results agree substantially barring the $40,000——

A. At the commencement, $120,000 for the holder, and bond discount of $40,000.

Q. Mr. Guernsey has asked you several times about valuation. You did not attempt did you and it was not your purpose in your examination or in making the report to give the value of this property as that term is ordinarily used, the market value?

A. It was not.

3413 Q. You were also asked about your instructions or who told you what was wanted, what kind of an examination was to be made. You were told were you not that what the defendants wanted was simply to know what the books of this company showed the property cost?

A. That covered my instructions.

Q. Your investigation then was for the purpose of ascertaining as near as possible exactly how much money had gone into this plant here in Des Moines.

A. As shown by its books.

Q. What other purpose, if any did you have either in making the investigation and examination or in submitting a report here than to ascertain the investment in the Des Moines Gas Co.'s plant.

A. Well that was the whole purpose of the examination.

Q. And what do you have to say as to whether or not that is what your report shows?

A. That is what it purports to show.

Q. And what do you have to say as to whether it shows it substantially correct as shown by the books with the modifications you have already explained?

A. It does.

Q. Now just before we went to dinner, and it just so happened we had the pleasure of eating dinner with Senator Cummins, just before we went to dinner counsel read into the record a record with respect to the increase of stock of the Capital City Gas Light Co. from $300,000 to $600,000 and you were asked after the reading of the record whether you saw anything improper in that record, and as I remember it you answered that you did not suggest anything improper. Now does the books of that company show that $600,000, either in money or property had gone into the

3414 plant un to that time?

A. No. I may say in further answer to your question that the Capital City company if it were being examined on behalf of a bond house, that $131,000 would not stand in the plant account unless there was an appraisal brought forward to substantiate the whole figure at that time.

Q. The truth is I suppose, I don't know and want to get your judgment about it from your experience in these matters, they are all new to me, I suppose the truth is after listening to the reading of that resolution and record that it was not property in the plant that Senator Cummins referred to at all in his resolution, but the franchise that he suggests in his resolution has a certain value?

Objected to as leading and further because it is asking the witness not only to interpret the resolution, but state what was in the

mind of the person who offered it, which certainly cannot be competent on any possible theory and which no very conservative man would attempt to answer.

Q. Don't get the notion Mr. Witness I am asking in anybody's mind.

A. My judgment when I saw the entry was they capitalized the franchise and what they termed immunities.

Q. You were asked about assets aside from the so called franchise aside from whatever franchise they claimed to have at that time. Did the books show anything like $600,000 in book assets over and above bonds?

A. The books showed assuming the $131,000 was represented in assets the books showed that they were that amount short of the $600,000. The $600,000 capital stock being increased to that amount after declaring a stock dividend of $300,000.

Q. The amount of stock that was issued at that time
3415 brought the total stock up to $600,000.

Q. That I understand you was $130 odd thousand dollars more than the assets as shown by the books?

A. Yes.

Q. So there was that much water if you use that term so far as the books were concerned?

A. Well if you call it water there was.

Q. And there was that much that if a rate for gas was to be based upon the capitalization there was that much of that capitalization that was not represented by the property or assets.

Objected to as leading and incompetent because it asks the witness to argue the legal proposition.

A. There was that much not represented by anything as shown by its books and the amount would want to be very carefully considered in rate making.

COURT: You found a net income there available for dividends $181,005.56?

A. Yes.

COURT: Then a dividend of four and one fourth per cent had been taken out of it?

A. Yes.

COURT: Leaving $168,255.56?

A. Yes.

COURT: As assets belonging to the corporation at that time.

A. Yes, their profits were invested in assets.

COURT: In other words there was that much surplus?

A. Yes.

Q. The difference between that $300,000 and that amount is what you call what, from the books?

A. General Byers' term water, appreciation I will call it.
3416 Q. The chart that Mr. Guernsey referred to that is found in your report merely represents a computation and tables that are found on page 29 of your report.

A. Yes.

Q. In Exhibit 33, there are three tables, tables 3, 4 and 5 as I designate them. Mr. Guernsey inquired about these tables. These three tables are worked out to show what could be accomplished by the theory advanced by Mr. Haganah?

A. That was my idea.

Q. That Exhibit 56, I suppose that has not yet been offered?

Mr. GUERNSEY: I think you are mistaken, I think it is offered.

Q. Now getting back to the alleged difference between you and Mr. Hagenah, that was broken off a little soon for me this forenoon. You suggested to counsel that you had a table that would illustrate that proposition very nicely. I wish you would hand it to me. Before I take it up I wish you would turn to your Exhibit 33 for a moment and just take the first item in the table and work it out for us and give us the amount that ought *ot* be carried in the first column in the second year on the correct theory of reaching investment values, correct according to your theory. Have you figures that for me?

A. Yes, sir.

Q. Give me the amount which should be carried down for the second year of that table in Exhibit 33, what do you make it.

A. Do you wish the process?

Mr. GUERNSEY: May we not have the amount first.

A. $325,792.

Q. That is the first year's depreciation?

A. That is depreciation, y-s, charged that year taken out of the plant account.

3417 COURT: I don't see what you mean?

A. The plant as the commencement of the period has decreased in value from 100 per cent to 98 per cent. I reduce it to that 98 per cent admitting the charge as an operating expense which is entered to always maintain the plant at the par value of 100 per cent. In this table he has the value of the plant at 102 per cent.

Q. Go through it and give us the way you work it out?

A. I accept the value of the plant at the commencement of the year $308.983. Add 8 per cent of the value $24,719, subsequent additions during the year $18,394. 8 per cent on the additions for six months $736.00. I charge operating expense after deducting allowance for depreciation giving a net result of $21,043 deducted from the figure before we find it gives $331,789. That depreciation was placed in in order to bring this plant to par value, consequently it has got to come out again and brings down the opening balance the second year to $325,792.

Q. Take the sheet you offered counsel this morning being report marked Defendant's exhibit 24 and you may state what that is and explain it to the Master?

A. I prepared this table in an endeavor to clear up any misapprehension about this theory and I assumed that we have a plant commencing the first year with one machine valued at $1,000. That each year thereafter on June 30th we would add another machine of $1,000 value and that each machine would earn net ten per cent

or gross 20 per cent and expenses, 110 per cent leaving a net return of 10 per cent on the amount. I give ten per cent on the opening balance and ten per cent on the additions and work it out beginning with the first year with a machine valued at $1,000.

Ten per cent would be one hundred. And another ma-
3418 chine June 30th, another thousand dollars and interest and then depreciation five per cent per annum on that machine, $75.00 operating expense $150 paying ten per cent on the investment, we have $2,275. Deduct gross earnings $300 and it leaves cost the first year or gives $2,075 investment in that plant. Carried forward each year I find at the end of 20 years we had an investment of $43,933.12. The original outlay here we would assume to go a thousand dollars being the price of the first machine and as there is always your depreciation reserve %75.00 plus the amount required to get a new machine the final result would be that $10,000 would be invested in that plant in capital at the end of that time having on hand 21 machines at $21,000. Take the machines themselves and work the depreciation down on the basis at which you charged it at five per cent per annum you find the present value of those machines to be $10,000 representing this investment value of $43,000. There is a proportion of that depreciation in fact all the depreciation went back into the plant to get its ten per cent consequently that has got to be taken care of and the stockholder has got to get something coming yet under the Wisconsin theory and that amount will bring up the investment to $21,000 the par value of the machines at the end of the time. He having pulled down net ten per cent of his investment throughout and five in some cases. He gets his five per cent throughout the depreciation earning ten per cent and his five per cent taken care of would bring up his investment to 21,000 the par of the machine, but not $43,933.

Q. In other words, if I understand your statement and your analysis and criticism of Mr. Hagenah's statement under his theory if rates were based upon his method of ascertaining the method value the consumer would — paying a return upon prac-
3419 tically double the investment.

A. In this case yes, but in other cases it might work very much the opposite way where the company would have no investment at all wipe it out entirely.

Q. In other words if it was operated long enough?

A. Carried long enough and a sufficient high rate you could wipe the investment right out even on this theory.

Mr. Byers: We offer Exhibit No. 34.

Court: Here is my idea of the Wisconsin theory, that it is simply a rate making table first and the design of it is to allow them to earn or recoup their earnings where they are not earning at least 8 per cent or ten per cent whatever it is. They are not affected by the excess, for instance if they were actually earning say only five per cent for rate making they are allowed to recoup that, but if it goes above that that they are not affected by it for rate making.

Of course if they are affected by high and low the greater their earnings the less value of the plant would be and the less earnings the greater the value of the plant would be.

A. It is not the idea I am quarreling with, it is the application of the theory.

Mr. GUERNSEY: I would like to defer our objections to this Exhibit 34 until we understand it a little better.

Q. To cover that question of depreciation a little just give us your explanation of that and then we will take up another matter?

—. All I can say more about it is that the investment calculated on the depreciation values would give you $10,000 and they still have $11,000 in that imaginary plant which would leave your Wisconsin theory investment $21,000.

3420 Q. For a little over $11,000 investment?

A. For $10,000. The other $11,000 representing these profits which they have not taken out, capitalization of their profits. I might say further the difference between $43,000 and $21,000 represents the depreciation which has gone in out of interest. It is simply a question of reducing the statement by the amount of that depreciation plus interest account.

COURT: Did you ever figure this from six per cent?

A. I have a six per cent table here.

COURT: I understand that, but did you ever figure it eliminating the excess over six per cent in one year?

A. I have not, I will be glad to do it for you.

Q. This page 29 of your report, I wish you would just state briefly the basis of that table and that computation?

A. That table purports to show the added investment as per the books subject to the adjustment and qualifications made by Mr. Guernsey less depreciation as claimed.

Q. Worked out on six per cent?

A. No, worked out on the basis of their net earnings I stated and after applying six cents depreciation per thousand.

COURT: In other words you took the net earnings for a particular year and divided that by six and got this result didn't you?

A. No, sir; divided it by the investment to get the return.

COURT: In order to get this percentage?

A. Yes.

Q. Would this table if it were not for some adjustments you have made here show the cost of construction as it is shown by the books of the company?

A. It could be prepared that way.

Q. I wish you would prepare a table for us that will show what if anything must be added or subtracted from your statement

3421 on page 29 so that the result will show the cost of construction as it appears on the books of the company?

A. Yes, sir.

Q. Now you were questioned about one item of rate expense, I think it was fairly cleared up and at least your notion about what

ought to be done with it was fairly well cleared up, but I want to ask you if you can give any better reason now for excluding an item of that kind than you did on yesterday.

A. Well I might offer this suggestion and explanation if the company was about to sell and anyone about to buy this property both sides would be very anxious to consider this question of rate expense in order to determine what this property could do. In other words if the Des Moines Gas Company was going to sell this property on an earning basis I rather imagine they would want to exclude this as an expense, want to make large earnings and I think quite properly so.

Q. In other words I get this understanding from your testimony that an expense to be an operating expense in a manufacturing business must be an expense growing out of the operation of the business itself.

Objected to as leading, I think the witness ought to be permitted to do part of it.

A. That is my idea.

Q. Take this account or charge, in the end of course it all must be considered in making up a balance sheet to determine where you stand?

A. It has all got to be considered ultimately.

Q. Take a case like this for instance, see if it is a fair illustration of what you have been trying to get at. Suppose that some
3422 employé or officer of the company should be short or take out of the till a thousand dollars and carry it off, it is lost. There would be a thousand dollars of money taken out of the funds of the company, would that item be proper to go into operating expense?

A. No, I would feel quite justified to take that out in determining the sale or buying of that business.

Q. Why.

A. It should not be an ordinary recurring matter in that office.

Q. Is there any difference in principle between that item and an item like this of rate expense?

A. The principples are the same, yes.

Mr. GUERNSEY: Your idea both of them occur out of a steal?

A. No, I don't suggest that for a minute.

Q. I don't want of course to spend too much time on this salary proposition, but you were asked if there was anything wrong about this salary proposition, you don't mean to endorse that $10,000 charged for salary in this case do you?

Objected to as leading and I submit if your honor please that we ought not to be required to make this objection so continuously especially where questions are of this kind.

A. I don't feel I am in a position to either endorse or negative.

Q. Now let me see if you can't negative it. You examined these books pretty carefully?

A. Yes, sir.

Q. You know what force is up there at that office?

A. Yes, sir.

Mr. GUERNSEY: We object to all of this as leading and as argumentative putting the argument into the mouth of the witness and getting the witness simply to say yes.

3423 Q. Did you find any indication up there at all about that office that these gent-emen were doing or performing any services for this company that justified any such charge?

A. One or two of the gentlemen do perform to my knowledge certain services, but whether those services or the value of them justify that charge I am hardly in a position to say.

Q. Did you find anything that the U. G. I. was doing that justified it in geting $10,000 salary?

A. Well it might be justified in getting it under certain circumstances.

Q. Well did you find any?

A. I didn't observe it.

Q. Was there anything about the plant up there or its management that indicated to you the necessity of any help in the management of the business or in the performance of the necessary labor about the offices.

—. ——.

Q. In addition to the management that is local here?

Same objection.

A. I had the impression that the local management was very competent.

Q. Mr. Guernsey asked you if it was not entirely proper and common to have these expense extras charged up to the co-t of operating the business. Is that usual and customary where companies are operating at a loss and not making money?

A. If we don't make any money there is no subscriptions I know that.

Complainant moves to strike the answer as not responsive.

Q. Well is it usual at all or common for public service corporations in states where the rate is a matter of adjustment by the authorities of the state to charge up as an operative expense such items as you find charged up here including dues and fees to local

3424 clubs and such things as that?

Same objection and as leading.

A. All companies charge up some chairty expense to a greater or less extent, but I notice it is usually a lesser.

Q. Now just another thing about leakage here. Mr. Guernsey went over that and you say as I remember it in one of your tables here you used 1.35 per cent leakage.

A. If I said so I didn't intend to say that. 1.35 cents per thousand.

Q. What was the *pre* cent leakage.

A. 4.31 per cent leakage.

Q. That is what you carried into that table?

A. Yes, sir.

Q. Mr. Guernsey had you verify the additions subtractions, multiplications and divisions if there were any in Exhibits 48, 49, 50, 51, 52, 53, 54 and 55. Now let's take Exhibit 48 a minute. Start with Exhibit 48 and work for the Master if you will a table using these figures so far as they go to show the average investment for five years and what the rate of return would be on the basis of this Exhibit 48.

A. Have you any objection to doing this tomorrow, it is quire a little work.

Q. No objection, if you will take Exhibit- 48, 49, 50, 51, 52, 53, 54, 55, and 57 and make them up showing the average investment for the same time and rate of return?

A. Yes, sir.

Q. Something was urged in Mr. Guernsey's questions at least against your taking the low manufacturing cost in 1910 in making up your tables How do you justify that?

A. That is the actual. That is what the company has
3425 demonstrated it can do and is doing.

Q. The manufacturing cost for 1910 shows exactly what this company with its present facility and capacity can work out here in the ggas business.

Objected to as leading.

A. Yes.

Q. I wish you would tell us in your own way if you have anything further to say with respect to why you took the manufacturing cost of 1910?

A. I have nothing to say about it, but the company demonstraed it did business in 1910 on that basis.

Q. Was there anything to indicate that the company to do that were compelled to curtail in any respect expense where they ought to have been more liberal?

A. Seemed to me reasonable to assume they could continue to do so.

Q. That is the reason you took the item of 1910?

A. Yes.

Q. And not for the purpose as was intimated of being unfair in making up these tables?

A. Oh no I am not in the figure juggling business as Mr. Guernsey kindly suggested.

Q. You have a statement in the record this morning that I think perhaps won't read as well to you when you see it as it might have sounded to you and I want to call your attention to it so you may explain it. I can't state it exactly to you, but that you did just what you were paid for. What did you mean by that statement?

A. That I complied with my instructions from the corporation counsel to provide his office with all the information available in
regard to the operations of this company.

3426 Q. What did you do in the way of carrying out these instructions other than to make a good faith effort and a diligent effort to ascertain every fact that would either inform the Corporation Counsel as to exact investment in this case of this company or inform the Master or other counsel?

A. That was my *soul* endeavor in making this examination to get all and every fact available for the information of court and counsel.

Q. Finally now I want to ask you, as I remember it your figures show the value not the cost but the value of the investment of this company on December 31, 1910, to be in *t*round numbers $1,550,000.

A. As shown by the books with certain eliminations.

Q. Now what do you say as to whether from the examination you have made with your experience in these matters as to whether that sum represents substantially the investment value of this property.

A. I am afraid I can't very well answer that, I have not enough experience to say there is so much invested in that plant.

Q. I do not mean that, I mean the experience you have had as to the accuracy of the work. Leave ou*f* value and use investment in the plant?

A. As to the accuracy of its books in this regard do you mean?

Q. Would you be willing to rest your judgment upon that showing that amount as to the investment in this plant?

A. Yes, as shown by its books, yes.

COURT: Assuming that that appraisement is correct.

A. A correct basis.

Q. This morni*j*g you spoke of *their* being *own* one dividend, was that exactly correct?

3427 A. One cash dividend.

A. Yes, one cash dividend. That is what you meant when you said one dividend?

A. I don't recall the question, but there was one cash dividend and two other dividends.

Q. What were the other dividends?

A. One $300,000 in 1897 I think and the other one on the sale of the Capital City property to the Des Moines company.

Q. And what was that?

A. $3,169,000 in securities.

Q. How much of that was interest bearing securities some of which have since been retired?

A. The interest bearing securities issued at that time amounted to $800,000 of six per cent preferred stock contracts, and $285,000 of first mortgage bonds.

Q. Both these items were dividends were they?

Objected to as leading?

A. Not exactly.

Q. What were they?

A. The $800,000 preferred stock contract, $120,000 of bonds and common stock $2,249,000 were declared as dividends to the stock holders of the Capital City Company.

Q. And the balance of the $285,000 five per cent gold bonds were absorbed in this Valley Junction business and in some other matter, the debt to the United Gas Improvement Co.?

A. Yes.

Q. $105,000?
A. $205,000 and a few hundreds.
Q. That was paid by the Des Moines Gas Co., turned over to the Capital City Gas Light Company for the U. G. I., $120,000
3428 of these five per cent gold bonds?
A. Yes.
Q. Then what do you have to say as to whether or not that would make $935,000 of interest bearing securities that were absorbed as dividends at that time?
A. I don't just reason that out.
Q. All the $800,000 of the six per cent preferred stock contracts.
A. That went to the stockholders of the Capital City Company as dividend.
Q. Then the $120,000 of five per cent gold bonds?
A. As part of the dividend, yes.
Q. That is $920,000?
A. Yes.
Q. Then there was $15,000 bonus or difference between the amount of the $120,000 bonds and the debt wasn't there?
A. Yes.
Q. There was a discount on those bonds just about $15,000.
—. ——.
Q. And it was all the U. G. I.?
A. As I understand it.
Q. On yesterday Mr. Guernsey had you admit, unless I am wrong that any new business commencing in new business you would have to borrow money to pay taxes. That is not true is it?
A. You might have to borrow money or issue stock to pay the taxes which taxes you would capitalize during construction. That is what I understand Mr. Guernsey wanted to know.
Q. Taxes are not payable at the first of the year are they?
A. They are not payable at the first of the year and I don't know how you charge taxes during construction here. Assuming there are any taxes during the period of construction you could reasonably capitalize it.
3429 Q. They would be charged to construction then?
A. Yes, sir.
Q. Did you refer to taxes on operations?
A. No I had in mind Mr. Guernsey asked me about taxes on construction.
Q. That would go into construction?
A. Oh yes, during the period of construction capitalized those.

Recross examination by N. T. GUERNSEY, Esq.

Q. Your taxes during construction would be treated as part of the cost of construction and capitalized on that basis?
A. Yes.
Q. The same way as interest during construction?
A. Until the plant is operating, yes.
Q. Until the plant is earning money?
A. Until it commences operating, yes.

Q. Do you mean to say that this distribution of the assets of the property of the Capital City Gas Light Company was what we ordinarily call a dividend?

A. That is a term you use in your own records.

Q. That don't answer my question.

A. Well I don't know what you mean. If you will explain it I will be very pleased to answer it.

Q. You don't understand my question?

A. I don't follow the meaning.

Q. You referred to the payment of some $12,750 as dividend?

A. $12,750, yes.

Q. Was this distribution of the assets of the Capital City Gas Light Company after they sold the property a dividend in
3430 the sense that the $12,750 was a dividend?

A. It was not, no. Of course I would not suggest it was at all.

Q. It was division of what this company had received for its entire assets?

A. Yes, including its profits on the transaction.

Q. It was not a dividend paid out of earnings?

A. No distribution of assets including profit made on the transac-ion.

Q. Whatever they made on the sale of their property?

A. Exactly.

Q. If they did make any profit on the transaction that profit you do not take it into account when you give the investment value of the plant in the hands of the next succeeding company do you?

A. No.

Q. You cut that out?

A. Yes.

Q. In other words you treated this in the hands of the Capital City Gas Light company as something that was paid for this property, but did not treat this in the hands of the Des Moines Gas company as something it had paid for the property. That is right, isn't it.

A. That is right.

Q. Now you said one reason why this rate expense should be excluded would be that if you thought or if the Des Moines company was endeavoring to sell this plant, and a purchaser was looking into the earnings and operating expenses, the company would like to exclude it?

A. As an expense, yes.

Q. Then how about the purchaser, do you think he would want to ignore it and then spread it over the next ten years?

—. Yes, that should be ignored as regards the high cost
3431 which applied to the two years?

Q. The purchaser knowing it would be applied to future years would ignore it?

A. If he would have to pay the expense he would allow for it, but in determining the possibility of the business he would not take it into account?

Q. Unless he assumed in view of the outlay on the plant that might occur not every year, but periodically.

A. Every two or three years might be a more important factor.

Q. After mature deliberation that is the best reason you can give us for excluding this item?

A. I think it a very good one myself.

Q. Suggested to you by whom?

A. Not suggested.

Q. Haven't had any conference?

A. I don't require a conference in a matter of that kind.

Q. You have told us two or three times in answers to leading questions put to you by your counsel on redirect examination that the only thing you tried to do in this examination was to ascertain the cost of this property. That is an error isn't it?

A. That was one of the things I endeavored to ascertain, not the only thing.

Q. You have stated two or three times in answer to leading questions that was the only thing?

A. If I said so I didn't mean that.

Q. You put in a good deal more time getting operating?

A. Perhaps equally distributed.

Q. Checking that voucher by voucher, the last year, that was a big piece of work?

A. That was a good big piece of work.

3432 Q. The biggest single piece of work in the whole this?

A. Barring the preparation of the report itself, yes.

Q. Take this matter of salaries again I want to get what your position is squarely, if I can get it. You have testified about it three times now and I want to try again. Do you say that these salaries are items that ought to be excluded or not?

A. I have no particular view with regard to these salaries, whether they ought to be excluded or included, it is a matter for the court to decide.

Q. You have not intended to change your testimony on that subject?

A. Why no I don't think I did. I didn't intend to.

Q. Now let's look at this Exhibit 34 a minute, I don't understand it. You start out the first year with a thousand dollar investment in your machine?

A. Yes.

Q. And you charge a return of $100?

A. Yes.

Q. Then you put in another machine in six months?

A. Yes.

Q. Figure the same kind of a return?

A. Yes.

Q. Then you figure your depreciation on the plant is $75 on the two machines for that year?

A. Yes.

Q. So that to make that man whole at the end of the year he would have to have his machines and $150 return and $75 to make up depreciation on the machine.

A. No.

Q Well haven't they depreciated?

3433 A. He is entitled to get his machines $1925 plus $75 plus his $150.

Q. Let me ask my question please. You assume he is entitled to a return of $150 don't you?

A. Yes.

Q. During that period you assume his machines have depreciated $75 don't you?

A. Yes.

Q. So at the end of the year he has two depreciated machines?

A. Yes.

Q. To make up that depreciation would cost $75 wouldn't it?

A. Yes.

Q. So if you give him the machines in their then condition plus $75 he would have his machines as good as when they were put in?

A. Yes.

Q. He would have to have a return of $150 in addition to that wouldn't he?

A. Yes.

Q. That is exactly what I asked you a few moments ago isn't it when you dissented?

A. No it is not.

Q. So he should have at the end of the year $225 and the machines in their then condition, that would give him his return and enough to take care of the depreciation- that have occurred up to that time?

A. No.

Q. Now we will go over it again. I thought that was what you told me a moment ago.

A. I didn't intend to tell you that. He had the machines in the depreciated condition his reserve of $75.00 and $75.

Q. I am not asking what he did have but what he ought

3434 to have to make him whole on your theory?

A. That is what he ought to have.

Q. Now what he did get as a matter of fact he had gross earnings $300 and operating expense $150?

A. Your expense don't include depreciation.

Q. Of course I understand that. If they did include depreciation he would come out just even?

A. Come out $75 net earnings.

Q. If that $150 included depreciation he would come out just even at the end of the year, would not have been any $75 shortage.

A. I don't follow that reasoning out.

Q. You would then not have to charge depreciation in column five?

A. If you eliminate depreciation in column five you would come out $200 at the end of the year.

Q. But take it as you have it here at the end of the year he has $150 out of which to reimburse himself for the depreciation and the earnings?

A. Yes.

Q. And that is $75 short?

A. Yes.

Q. Now then in order to make that up to him you add that to his investment and pay interest on it?

A. The $75 I stated before went into additions consequently was earning 10 per cent.

Q. What additions.

A. On the next business, that $1000, when he bought the machine he put in $925 new capital and $75 depreciation.

Q. Oh no he didn't do that because he bought the machine in June and didn't get the depreciation until the end of the year.

A. Never mind when he got it, it went in there. He
3435 utilizes his depreciation as he goes along to buy new machines.

Q. But now then let's see, he is not entitled to that $75 until the end of the year.

A. Be entitled to half of it as he goes along say $37.50 in June.

Q. So he would not have it June 30th to put into the machine?

A. Might not have it all, go into the next machine.

Q. Does the correctness of this computation depend upon his putting that $75 into the new machine every time?

A. It depends upon the depreciation going into the investment.

Q. If he put the $75 into the new machine what did he put into the old one to keep it up?

A. That is part of his operating expense.

Q. So that you have allowed him here enough to keep up and maintain the old machines and help buy the new ones.

A. Yes.

Q. Which of course would be an unreasonable amount of depreciation?

A. I don't claim any reasonableness, simply an arbitrary thing to demonstrate the point. I don't say it is an actual occurrence.

Q. Suppose he had not had that depreciation, $75 to help buy that new machine, before he got to depreciation and had paid that $75 out of his own pocket and then when he received the depreciation had put that back into his pocket, would that make any difference in the calculation?

A. Bring the same results, the final result would be the same.

Q. So it makes no difference whether he uses this depreciation to buy a new machine or not?

A. If he puts the depreciation up in a reserve it has got to be earning on the same basis it goes in at.

Q. That don't answer my question.

A. That is as far as I can answer it.

3436 Q. All right I wil- try another. Now then if your depreciation here is charged up on a correct basis you have just enough to maintain your plant and keep it up to its original condition during this period haven't you?

A. Yes.

Q. You can't take that depreciation and put it off in a fund for twenty one years and let it pile up and keep running your plant can you?

A. It would not be good business.

Q. It would be worse than not good business?

A. You would have to go out and borrow it to finance your plant.

Q. You would have an additional expense in here you have not put in if you followed out this theory of yours and compounded that depreciation fund that way wouldn't you?

A. My point in that depreciation fund in the Hagenah table is to show——

Q. I didn't ask you what for, I just asked you for the fact.

A. If you put in into the plant as you put it in there you have got to get it out on the same basis, no other answer to it.

Q. I didn't ask you that. If you compounded this depreciation fund as you say you have to get these results the result would be that your plant would not run or else you would have to borrow some money or incur some expense to keep it going.

A. To put your fund outside?

Q. And if you did that you would have to pay for it?

A. Yes.

Q. And that same ten per cent?

A. That is reasoning away from the original proposition.

Q. Away from your theory but not from the facts?

A. Away from the facts too. The fact that this depreciation is added here and you are putting the plant in more than face
3437 value $1000 and you have got to bring it down——

Q. You added that $75 there for that depreciation?

A. Yes.

Q. Where did you get that to add?

A. The result of this computation.

Q. Oh no, this showed a deficit of $75.

A. On ten per cent, yes.

Q. So this man did not add his return but was $75 short. You add in your bookkeeping here $75, but where did you get the money to put in there?

A. This outside column here and the outside column of the Wisconsin theory are not represented by money at all, that is the fallacy of it.

Q. To have that $2,075 there that $75 would represent something that the plant owes this man to make him square?

A. That would represent the deficit of his ten per cent income.

Q. That they owe him to make him square?

A. Yes.

Q. Now then at the end of your first year he would have in machines $1925 wouldn't he? That is he would have his machines depreciated $75?

A. At the end of the first year, yes.

Q. Then he would have $75 to make up that depreciation?

A. Yes.

Q. Then he would have $75 of his return?

A. Yes.

Q. He would be short the next $75 of his return?

A. Yes.

Q. So you then owe the man the $75 and add it to the value of your plant?

3438 A. Yes, sir.

Q. So the amount of his investment at the end of the year would be $2075 instead of $2000?

A. Take the depreciated value of the machines, the depreciation fund and what was coming to him.

Q. If you take that depreciation out of there he would be short $75?

A. I am not taking it out of there, putting it back in the plant.

Q. But you do take it out when you get through with the criticism of the Hagenah computation?

A. Yes, because this depreciation goes into the plant and has got to earn on the same basis.

Q. Now let's go to another year, he started out at the end of this year the man had $2075 invested, $2000 being made up of the $1925 plus the $75 to make him his original investment and the $75 being made up of the deficit that they owed him. Now at the end of the next year we find this change don't we that he has invested another $1000.

A. No, not exactly. He invests the amount returned over and above his depreciation to buy his machine.

Q. Well if he takes the depreciation away from the $1925 he has not got his original investment has he?

A. He takes that $75 to bring his investment up, puts that *in* additional capital in to buy another machine.

Q. Let's see what is done on your theory. He had at the end of the first year in machines $1925 didn't he?

A. Yes.

Q. Then he had in money to make up depreciation $75?

A. Yes.

3439 Q. Now then you say he takes that $75 and puts in $925 more with it and buys another machine?

A. Yes.

Q. Then he will have at the time he makes that purchase in his machines $925 plus $1000 and he will be $75 short of their original value.

A. Yes.

Q. And he has invested this depreciation fund so that his capital is depreciated then $75?

A. Yes.

Q. That is right isn't it?

A. Yes, the $75 is taken care of in additional machine, it goes back into the business.

Q. The investment there is not as you put it here, there is not a thousand dollars additions to plant, only $925 additions to the plant and $75 invested on account of depreciation?

A. Brings exactly the same results.

Q. I don't care for results.

A. These are the facts when you come right down to the same basis that is the fact.

Q. So that at the end of that second year what is his deficit?

A. He is $207.50 short in his income.

Q. So on your theory at the end of that year——

A. Subject to a return of ten per cent on his investment and his depreciation fund gone back in the business.

Q. So at the end of that second year he started out with $2,075—or did he start out with $2,075?

A. He started out with two machines and his shortage in income.

Q. During this next year he gets how much depreciation?

A. $125.

3440 Q. And each year he goes a little further in the hole then on your theory?

A. Yes.

Q. It don't make him whole?

A. Does not make him whole.

Q. And it never will?

A. At the end of twenty one years he will be whole and have $21,000 representing his $10,000 of capital and his $11,000 of earnings which he has not taken out?

Q. There is how much capital?

A. $10,000 being the present value of his machines, he will have that and he should have $11,000 to take care of his shortage in income.

Q. How many machines did you have him buy?

A. Twenty one.

Q. What was his total investment?

A. He spent for the machines $21,000.

Q. You give him back how much?

A. All he receives from depreciation fund, $11,000.

Q. Nearly twelve?

A. No, $11,000 the exact figure.

Q. He put in $21,000.

A. He paid $21,000 for machines, put in new capital $10,000 and his depreciation of $11,000.

Q. Now then how much did he get out of it?

A. Got earnings, his ten per cent interest was $22,000.

Q. That is only on your original investment.

A. Oh no.

Q. That is not on your $10,000?

A. Yes, on the $10,000 he got his twenty two thousand.

3441 Q. What else did he get out of it?

A. Got his operating expenses out of it.

Q. What else did he get?

A. That is all.

Q. Your theory of this thing is this he has advanced out of his own pocket $10,000.

A. At varying intervals as required.

Q. When did he put that up?

A. Put a thousand up when he bought the first machine and additional money up as he bought additional machines utilizing his additional money as it goes along.

Q. I want to go back to that second year, you start out that year with $2,075 that he is entitled to on account of deficit and a return on investment?

A. Yes, sir.

Q. Now at the end of that year instead of getting any of that back he has made a further deficit?

A. Yes.

Q. So that with his additional investment it brings him up to $3,270.50

A. Yes. I may make the suggestion this table could be checked up by taking additions to the plant of a thousand dollars less depreciation.

Q. What is the addition to the plant the last year, $1900?

A. The last year $25,000.

Q. It is a negative figure.

A. Negative figure.

Q. You don't put anything in at all?

A. Not the last year, takes a little out.

Q. Gets back $25.00, when he buys the machine he gets $25 back

3442 A. It begins to get his capital then.

Q. Suppose this man stopped at the end of the second year how much would he have to get to get out whole plus the depreciation on his machines and allowing him this return of ten per cent.

A. He would have to get o-t the $3,207.50.

Q. The end of the first year I said?

A. To get out whole, with his ten per cent he has got to get out $2,075.

Q. Takes that to get him out whole?

A. Yes.

Q. Take $3,270.50 to get out whole at the end of the next year?

A. Not quite.

Q. Not quite?

A. Less ten per cent on that fund that went into the depreciation account.

Q. He was entitled to earn that if he put it in?

A. He is earning it and not entitled to have it piling up. That is my objection to it.

Q. Let's follow him through that year and see whether that is right. It takes $2,075 to make him whole at the end of the first year?

A. Yes.

Q. Instead of getting out of the business and taking the money he goes ahead for another year with a guarantee of ten per cent return, suppose I had made a contract with that man I would give him a ten per cent return and let him quit at the end of any year he wanted to. Now take this second year he starts in with $2.075. Now he is entitled to a return on that of $207.50 isn't he?

A. Yes.

Q. And then he is entitled to $50 more in the way of deficit.

3443 A. That makes $257.50.

Q. Now of course at the end of that year he has not received the return by how much?

A. $3,200.

Q. Now he is not short on the return that much?

A. The return $500.

Q. This second year $2,075 is what he has got in?

A. Yes, sir.

Q. Then he puts in another $1,000 and the return he would be entitled to would — $257.50. Now he is short some of that, how much is he short? He is short isn't he $152.50?

A. No, he is not short that; be short $72.50.

Q. He is entitled to a return of $257.50, that is right isn't it?

A. Yes, that is right.

Q. Now his gross earnings are $500?

A. Yes.

Q. His operating *are* $250?

A. Yes.

Q. His depreciation is $125?

A. Yes.

Q. So if I subtract $375 from $500 I will get his shortage?

A. Yes.

Q. That is $125?

A. Yes.

Q. That can apply on the $257.50 can it not?

A. Yes.

Q. That is all you can apply on it?

A. Yes.

Q. That gives you how much left?

A. $132.50.

3444 Q. Then if I settle up with him at the end of that year I would have to pay him what he had to begin with $2,075 plus the $132.50 wouldn't I, he would have to have that to come out even wouldn't he?

A. No. You lose sight of the seventy five which went back in the business.

Q. Well but I don't think I do.

A. You would have to stand sponsor for $3,200 with his ten per cent on seventy five which went in because the depreciation goes into that business.

Q. I din't care whether it goes into the business or where it goes.

Q. That is the whole thing as far as that is concerned. That is the whole point with me that goes back there.

Q. In other words what it would be worth depends on where he invests the depreciation fund, not what is the amount of the fund or the return on it but where he invests it.

A. Not altogether. He has got to invest that fund if he draws the fund out of this business got to invest the fund at the same rates.

Q. Go back to the $2,075 and you show me where I am wrong. This man I made this contract with call him Mr. Brown had $2,075 invested there at the beginning of the year.

A. Yes.

Q. And he has that much in there that he is entitled to part of it in the business and part of it in the shape of a credit there the amount of $75 that we owe him?

A. The $75 of the depreciated value of these machines is in the business.

Q. In there was $2,000 representing value of the machines?

3445 A. Exactly.

Q. Then $75 I ow- him on account of earlier losses.

A. Yes, sir.

Q. When we get through that year he has put in another $1,000?

A. Less $75 paid on depreciation reserve. That $75 has got to go back in the business.

Q. You spent that the 30th of June before?

A. I will concede to it in this year, don't make any difference.

Q. I can't follow you if you don't say harder than that.

A. I don't care what year you put in it.

Q. You have got to have some theory or other more permanent?

A. I think my theory is quite permanent.

Q. If I take that depreciation fund and put it into a new machine then what I invest is $925?

A. Yes.

Q. And I have not anything to take care of the depreciation on my old machine if you use that to make investment, a new investment of a thousand dollars?

A. You are bringing yo-r original investment back by putting in this new machine, putting depreciation in that machine.

Q. I know, but you can't call that investment of a thousand dollars where you have taken the depreciation set aside to take care of the old machine and put in a new one, haven't got the $2,000?

A. You have your new machine and depreciation on the old machine.

Q. Is that right?

—. That is quite right I think. What happens in practice every day.

Q. You haven't at that time taken care of the old machine when you put in a new machine if you adopt that theory?

A. Oh yes.

Q. ——.

3446 A. You will find that works aout all right. I can't explain any more than I have explained, I have explained it as well as I can.

Q. There is one thing I want to ask, down below here you have got gross earnings $44,000.

A. Yes.

Q. Then you have offset against that another $44,000 making up the operating expense and interest?

A. Yes.

Q. So that your gross earnings are not sufficient during any period to take care of your operating expenses, interest and depreciation.

A. They fall $11,000 short through the entire period consequently

but investment at the end has got to be $21,000 inste-d of 43 thousand odd.

p. What does this item mean excess of interest over that applicable to actual earnings?

A. That is the interest accumulated assuming your depreciation fund goes into the business the $11,000 here would have earned on a ten per cent basis $11,933.

Q. Does that mean that that is interest on the depreciation reinvested in the business?

A. Yes, in other words it is the interest on the proportion of these opening balances which leaves the accumulated losses or depreciation bot- taken care of.

Q. Do you make any distinction between depreciation and accumulated losses?

A. They are all in there on this theory.

Q. Then that is interest on depreciation and interest on that balance whatever it is?

A. Yes, might call it that.

Q. That is a more accurate way of putting it isn't it?

A. It may be, yes.

Here the further hearing was adjourned until 9:30 A. M. Tomorrow.

3447 Saturday Forenoon Session.

SEPTEMBER 16, 1911—at 9:30 A. M.

Counsel for the respective parties all present.

Testimony on part of defendants resumed as follows:

JAMES HALL, continuing his re-cross examination, examined by N T. Guernsey, Esq., testified:

—. Now referring to Complainant's Exhibit 59, and your Exhibit 34, you will notice that the first column in your Exhibit 34 which gives the opening balance has been divided here in Exhibit 59 into two amounts?

A. Yes.

Q. The second column showing the additions on account of the deficits at the various years?

A. Yes.

Q. Now your column number one is made up of these two factors shown here as "A" and "B," in Exhibit 59, are they not?

A. Yes.

Q. Now your column we have divided in this Exhibit 59, and I wish you would state whether that is a correct division; that is, we have separated into sub-column A the interest on the investment and into sub-column B the interest on the deficit?

A. Yes, that is correct.

Q. That is correct?

A. Yes.

Q. Now 3, 4, 5, 6, 7, 8 and 9 are, I believe, just as they are in *in* your Exhibit 34?

A. Yes.

Q. So that this would agree with your Exhibit 34, except it is subdivided as to these two columns?

3448 A. Yes.

Q. Now, I wish you would refer to Complainant's Exhibit 60, which is headed, referring to your Exhibit 34. Now, the gross earnings for the period are correctly stated there as $44,000, as taken from your Exhibit?

A. Yes.

Q. And the operating at $22,000; that is correct?

A. Yes.

Q. And the depreciation $11,000?

A. Yes.

Q. Now if a man wanted to go out of business at the end of this period he would have, if he had used his depreciation to maintain his machines, the difference between thirty-three and forty-four in cash—that is $11,000?

A. Yes, that is depreciation he set aside.

Q. No, if he had maintained his machines——

A. Assuming he had maintained his machines he would have $11,000, being the amount he used as depreciation, set aside for that.

Q. What he used for depreciation he would not have left, of course?

A. If he set aside this amount for depreciation each year——

Q. I am not assuming that he did not—he maintained his machines?

A. He couldn't maintain it at 100% value.

Q. Well, he could theoretically at least have the machines in that condition or something that represented whatever depreciation there was in them?

A. Yes, if he applied the depreciation fund, yes.

Q. So that he would have if he maintained his machines, he would have left $11,000?

A. Yes.

Q. He would also have left his machines in 100% condi-

3449 tion or something that represented that?

A. The machines plus other machinery to make up 100%.

Q. So that we call that $21,000?

A. Yes.

Q. So that he would have left $32,000?

A. On that reasoning, yes.

Q. On your figures?

A. I do not agree with your reasoning—on your reasoning, yes.

Q. I am not asking you to agree with the reasoning. We will go back now and see where we disagree on our facts. During this whole period he would receive $44,000?

A. Yes.

Q. He would have to pay operating expenses?

A. Yes.

Q. If he kept his machines up that would take $11,000 more?

A. Yes.

Q. He would use up $33,000?

A. Yes.
Q. That would leave him $11,000 at the end of the period?
A. Yes.
Q. He would also have the machines?
A. Yes.
Q. So that he would have altogether $32,000?
A. Yes.
Q. Now, then, on the other side of that, if he came to figure it up, against that $32,000, he would put in the $1,000?
A. Yes.
Q. Then he had additions $20,000?
A. Yes.
Q. Then he would have been entitled to interest amount-
3450 ing to $32,933.12 on his original investment?
A. Yes.
Q. And on his additions $1,000?
A. Yes.
Q. So that he would have gotton in with his investment and his interest $54,933.12?
A. Yes.
Q. He would have taken out $32,000?
A. Yes.
Q. So that he would have been short $22,933.12?
A. Yes.
Q. And that is just the amount of the depreciation and the interest on the depreciation?
A. Yes.
Q. That is what he would have been short on the transaction?
A. Yes. I would like to add, the fundamental mistake in this statement that the depreciation has got to come out with the interest—I can not see any other way; I have spent hours over it and can not make any other thing out of it.
The MASTER: To get the exact depreciation each year properly you simply keep the investment whole?
A. Before you are adding on your depreciation.
Q. You take the depreciation fund and put it back in the business?
A. It is added just the same as outside capital.
The MASTER: I am talking about true depreciation.
A. It keeps the original investment whole.

The Complainant offers in evidence Exhibit 59 and Complainant's Exhibit 60.
We ask the reporter to copy into the record the short exhibit, being Exhibit 60.

3451 Mr. BYERS: Exhibits 59 and 60 are objected to as being incompetent, immaterial and not proper cross examination.

Complainant's Exhibit 60 reads as follows:

3452 "COMPLAINANT'S EXHIBIT 60.

Referring to Defendant's Exhibit 34.

Gross Earnings		$44,000.00
Operating Expenses	$22,000.00	
Depreciation	11,000.00	
		33,000.00
Balance		11,000.00
Machines, 21—100 per cent Good		21,000.00
		$32,000.00
Original Capital January 1, 1881	$ 1,000.00	
Additions	20,000.00	
Interest { $21,000.00 / 11,933.12	32,933.12	
Interest on Additions	1,000.00	
		54,933.12
Deficit		$22,933.12
Investment Value		$43,933.12
Value of Machines as Above	21,000.00	
Deficit as Above	22,933.12	
		$43,933.12

3453 The WITNESS: I have checked over Complainant's Exhibit 56 and there are one or two small clerical errors here which I have noted on the bottom, otherwise it is all right.

Q. Is there anything of any consequence to affect the actual conclusions?

A. It is immaterial; two or three hundred dollars. I figured out the adjustment of the gross income also as we show it. Here are six copies of it.

Q. Referring to Complainant's Exhibit 61, Mr. Hall, this memorandum which you have made up at our request reconciling your gross income for the five years ended December 31, 1910—your net income, I guess it is—with the same figures as they appear on the books of the Company?

A. Yes.

Q. And under the column headed Cr. you put in your additions?

A. Yes, under the column Cr. representing credit.

Q. You put in what you add to the operating expenses and deduct it from the net income and under the column Dr. you put in what you deducted from the operating expenses and add it to the net income?

A. Yes.

Q. Did you ascertain for me in what year this personal injury occurred?

A. Yes, sir; it was 1903; it was a mistake. It was thrown back to the prior period, prior to 1895.

Q. It was thrown back into 1895?

A. Prioe to 1895; it shoudl have gone into 1903, to be strictly correct; that is a mistake.

Q. So that we don't get credit for that anywhere?

A. You do not.

Complainant offers and reads in evidence Exhibit 61, as follows:

3454 "COMPLAINANT'S EXHIBIT 61.

Adjustment of Gross Corporate Income as Shown by Complainant and as Recorded in Defendant's Exhibit No. 30, Exhibit "A," for the five-year period to December 31, 1910.

Two Months to February 28, 1906	$15,377.48
Year to February 28, 1907	135,038.09
" 29, 1908	163,739.26
" 28, 1909	194,185.54
Ten Months to December 31, 1909	156,497.18
Year to December 31, 1910	185,729.62
As per Complainant's Records	850,567.17
As per Exhibit No. 30, Exhibit "A"	864,518.14
Difference	13,950.97

Accounted for:

	Cr.	Dr.	
Accidents & Damages—1906		$3,685.17	
Federal Tax—1910	$1,287.37		
Rate Regulation Expense		5,935.18	
Interest on Floating Debt		7,126.53	
Interest—Miscellaneous	1,508.54		
	$2,795.91	16,746.88	
		2,795.91	
			13,950.97

3455 The MASTER: There is one question I want to ask. Did you take out anything and on account of replacement?

A. No, I did not. I allowed all the replacements as they had them, if any, in the operating account.

Mr. BYERS: In that table you made there for the Master you used the wrong sign up there in your depreciation; you got it 6% and it should be six cents?

A. That is so.

Q. What do you mean by replacements, in response to the question that the Master asked you?

A. Replacement would simply be the putting in of something to replace something which was taken out.

The MASTER: The reason I ask this question, in his report he states that he agrees with Mr. Hagenah there was certain items which should have been replacements instead of expenses, but he made the remark if they are considered as replacement, they should go into the value of the plant.

A. Yes, providing you have taken out his own depreciation to take care of it, but any deficiency I would take care of out of my operating.

The MASTER: I asked the question simply to know whether he had taken out anything for replacement.

A. I did not feel it would be exactly fair to take anything out for that.

Q. This real estate item I asked you about Mr. Hall, I think you told me personally this morning you would have it looked up later?

A. I will have it got out. If General Byers approves of it, I will have Mr. Sangston put it in.

Q. That will be furnished later then?

A. Oh, yes; certainly.

3456 Q. It will be an accommodation to you to have it deferred?

A. Yes, I would much prefer; I will have to go east.

Q. Now with reference to this matter we took up yesterday, I will call your attention to your testimony on page 3352 and 3353 of the transcript; we were talking about this Hagenah table, which I will read: "Q. I don't care where it went, this man had to have both the depreciation and if the payment was deferred he would have to have interest on that and his return to make him whole? A. Yes. Q. Mr. Hagenah gives him both depreciation and return? A. I think he gives him depreciation twice, that is all. Q. You took away from him his depreciation after giving it to him once? A. I took away one, Mr. Hagenah doubles up on that depreciation and I separate it and give him one. Q. Where does Mr. Hagenah give him twice? A. On one side income charge depreciation on investment and not use it for getting reserve, purely a matter of book keeping." Now referring to this you did say, didn't you, that this was Mr. Hagenah's error and gave this man depreciation twice?

A. That is the effect of the thing.

Q. Didn't you say just what I read there?

A. Was that late yesterday afternoon?

Q. No, that occurred late on the afternoon of Thursday, September 14th?

A. I must have said it if it is there.

Q. That was a mistake?

A. It is not just strictly speaking correct. The interest which goes into depreciation——

Q. Don't explain, please, or I will have to cross examine you some more.

A. All right.

3457 Redirect examination by General BYERS:

Q. You may examine what the reporter has marked Defendant's Exhibit 35 and state whether that is a tabulation made up in response to a question put to you yesterday afternoon?

A. It is.

Q. To furnish us with a statement showing the book entries and a summary of the plant investment as taken from the books without any subtractions or additions upon your part?

A. It is.

Q. Exhibit 35 is that showing?

A. It is.

Q. That shows the total investment as you figured it out $1,730,-205.31?

A. Yes, sir.

Q. Without any depreciation, or subtraction of any kind on the books?

A. With the deduction of the sum of $264,108.78 charged off on June 30.

Q. That is on the books?

A. Yes.

Q. This shows just what the books show with reference to the investment?

A. Yes.

The defendants offer and read in evidence as a part of this witness' testimony Exhibit 35, which is as follows:

3458 DEFENDANT'S EXHIBIT THIRTY-FIVE.

Summary of Plant Investment as per Books.

January 1, 1895, to December 31, 1910.

Cost of Plant as shown by books, January 1, 1895:

Tank No. 1	$7,000.00
Holder No. 1	8,000.00
Tank No. 2	13,056.64
Holder No. 2	20,300.00
Old Gas Works	25,000.00
Real Estate	8,916.00
Office Furniture	358.07
Gas Building and Machinery	63,621.40
Improvement	27,097.47
Extension Works	153.03
New Coke Wagon	30.00
Tank and Holder No. 3	40,279.01
Meters	16,849.17
Street Main Extensions	40,256.37

Extension Fuel Gas		15,898.24
Street Mains, Old		64,357.68
Service Pipe		18,957.10
New Services		16,547.72
Street Lamp Extension		3,710.84
Street Lamp Improvement		11,135.03
Water Gas Plant and Patents		200,000.00
Construction Account representing stock issued without consideration		39,371.22
Total		640,894.99
Additions—January 1, 1895, to February 28, 1906:		
Amount as per report page 21	$648,760.90	
Amount debited to Construction Account May 1, 1897	131,744.44	
Capital City Electric Light Co. Stock	2,553.00	
		783,058.34
Total Book Cost at February 28, 1906		1,423,953.33
Additions—March 1, 1906, to December 31, 1910:		
Amount as per report page 21	484,487.94	
Valley Junction Property at price paid for same	45,000.00	
Bond Discount	33,950.00	
Reorganization Expenses	6,922.82	
		570,360.76
Total Book Cost of Capital City Plant plus Des Moines Company Expenditure		1,994,314.09
Deduct: Amount Transferred from Profit and Loss Account as at June 30, 1909		264,108.78
Total Investment in Plant December 31, 1910, excluding increase on transfer to Des Moines Gas Company		$1,730,205.31

3459 *Summary of Plant Investment as per Books*—Continued.

Total Investment in Plant December 31, 1910, excluding increase on transfer to Des Moines Gas Company.....		$1,730,205.31
Add: Increase in Plant Account on Transfer to Des Moines Gas Co. on February 28, 1906:		
Plant Account Des Moines Gas Company's Ledger	$3,592,723.24	
Less: Valley Junction Property...	45,000.00	
	3,547,723.24	
Total book cost of Capital City Company Plant February 28, 1906, as on previous page.....	1,423,953.33	
		2,123,769.91
Total Cost of Plant as shown by Books December 31, 1910		$3,853,975.22

3460 Q. You may examine what the reporter has marked Defendant's Exhibit 36, and you may state what that is?

A. Exhibit 36 shows, first, the average investment in the plant for the four year period from 1906 to 1909; for the five year period from 1906 to 1910 both with and without Valley Junction; that is, as those investments as determined by Exhibit 30 show the return and applying that investment upon the schedules submitted by complainant as regards Des Moines and Valley Junction in Exhibits 48, 50, 52 and 54. It also shows the average investment in Des Moines alone excluding $45,000 as the Valley Junction property and gives a return on the basis of Complainant's Exhibits 49, 51, 53 and 55.

Q. You took Complainant's Exhibits of yesterday, numbers 48, 49, 50, 51, 52 up to 55 and carried their computation on out to a final result as to return by adding the average annual investment and figuring out a return on the basis of their exhibits?

A. Yes.

Q. I suppose so far as Valley Junction is concerned, it may be more or less than it was at that time?

A. It may be; I assumed $45,000 in Valley Junction.

Q. I suppose naturally it had increased rather than diminished?

A. I would expect an increase.

Defendants offer and read in evidence Exhibit 36, as follows:

DEFENDANT'S EXHIBIT 36.

Estimated Average Investment and Return from Estimated Revenues.

Investment.		1906–1909, four year period.		1906–1910, five year period.	
		Years.	Product.	Years.	Product.
Estimated Investment, January 1, 1906.....	1,008,972	4	4,035,888	5	5,044,860
Additions to:

Percentage of Return.....	%7.39	7.26	7.56	6.01

*Assuming no increase in Valley Junction Investment during above period.

3462 Q. Yesterday you were asked by Mr. Guernsey about the $800,000 6% preferred stock contracts not being a dividend and you acceded to that; just what did you mean by that; were you simply dealing with the definition of the word dividend?

A. Very largely. The $800,000 preferred stock contracts, plus the bonds, plus the common stock issue at the time of the organization of the Des Moines Company was to be paid to the stockholders of the Capital City Gas Light Company.

Q. In other words, it was all divided between the stockholders?

A. Yes, their return of capital or profit.

Q. It was not, however, an ordinary cash dividend?

A. Oh, no.

Q. But it was a division of the spoils at the end of the term—finis, I think they wrote at the bottom of that page?

A. I think they did. You can call it distribution of the stock realized on the sale of the property.

Q. There would be no difference between that and dividing up the money if they had the money instead of the bonds?

A. I don't know; I think I would rather have the par value of the money.

Q. But so far as a division is concerned?

A. So far as the division is concerned, that didn't make any difference.

Recross-examination by Mr. GUERNSEY:

Q. The only point that was involved, what you told me yesterday, this was not a dividend in the ordinary sense of the term?

A. It is a dividend in the sense, ordinary sense of the term; it was not included in the return of capital. Take the word dividend as you would mean it is a return on investment; this is a return
3463 of capital, plus return on investment.

Q. It was a liquidation?

A. Yes.

Q. Referring to your Exhibit 35, that shows a total investment of $1,994,314.09?

A. Yes.

Q. And that includes this discount on securities and reorganization expenses.

A. Yes sir; everything added on.

Q. Just as *so in* as you make this charge against it, $264,108.78 you get away from the investment?

A. You get away from the money you put in.

Q. You get away from the investment?

A. Unless you take into consideration the investment is declining in value.

Q. You are getting away from the investment as soon as you are getting into that question?

A. From the original investment.

Q. Just as soon as you get into that, you are bound to take up the question of appreciation as well?

A. It should be considered.

The MASTER: These figures do not include working capital?

A. No, that is the physical property.

Q. Now there is one other thing—this investment is subject to another limitation, isn't it. The Des Moines Gas Company can not measure its investment in the plant by what the Capital City Gas Light Company paid for it, can it?

A. No.

Q. If the Des Moines Gas Company paid $800,000 in preferred stock contracts, and $285,000 is bonds, and then assumed
3464 $400,000 more of bonds, that is its investment in addition to the common stock, isn't it?

A. Yes.

Q. So that this don't represent the actual investment of the Des Moines Gas Company, does it?

A. In the second page, the total——

Q. I want this amount. This $1,994,314.09 does not represent the actual investment of the Des Moines Gas Company in its property?

A. That figure does not; no.

Q. This amount $1,994,314.09 is less than the actual investment of the Des Moines Gas Company in this property without any reference whatever to the common stock, is it?

A. I don't know that I follow you.

Q. The Des Moines Gas Company when it bought this property paid $285,000 in bonds?

A. Yes.

Q. It then assumed $400,000 more of bonds?

A. Yes.

Q. And then issued $800,000 of preferred stock contracts which were interest bearing obligations?

A. Yes.

Q. It has since put in $570,000 in cash, according to your figures?

A. Yes.

Q. Will you foot those?

A. $2,055,360.

Q. Now that represents what the actual investment of the Des Moines Gas Company is in addition to the common stock that was issued, don't it?

A. Subject to the deduction of $120,000 of bonds being paid for the United Gas Improvement Company debt.

3465 Q. Why do you deduct that; didn't they have to pay that as a part of the purchase price of this property?

A. Yes, that is right, yes.

Q. Now these items I gave you foot how much?

A. $2,055,360.

Q. And the Des Moines Gas Company has actually invested that much in the property in addition to the common stock?

A. Yes, actual investment, measuring by its bonds and preferred stock contracts will not agree with this.

Q. But the bonds and preferred stock contracts and the cash are the actual investment of the Des Moines Company?

A. Yes.

Q. These other figures do not represent the investment of the present company?

A. They do not purport to show that, no.

Q. Now, turn to Exhibit 36; I do not understand the upper part of this. Now your investment here stated in the upper part of this sheet, is based upon the original figures shown in your Exhibit 30?

A. Yes.

Q. Not upon either actual investment of the Capital City Gas Light Company, or the actual investment of the Des Moines Gas Company?

A. No, they are based on Exhibit 30.

Q. And it is lower than either of the other amounts we stated?

A. It is.

Q. You took Valley Junction arbitrarily—$45,000—without refererence to the value of that plant?

A. I did.

Q. Then when you got your total you divided that by four to get the average investment?

3466 A. Yes.

Q. Now in the lower part of this you get as a return under Exhibit 48 7.41 per cent?

A. Yes.

Q. Now that is a return on what?

A. On the average investment in Des Moines and Valley Junction as shown by Defendants' Exhibit 30.

Q. So that means, if you took Exhibit 48 as complainant's computation of the average net return applicable to interest and profits for the four years ending December 31, 1909, including Valley Junction?

A. Yes.

Q. So that upon your figures, if Valley Junction were included and the investment were put down to less than thirteen hundred thousand dollars, the return would be 7.41 per cent?

A. Yes.

Q. And that after deducting the operating expenses that you have deducted?

A. Yes.

Q. And without making any provision for rate regulation, accident and damages and the continuance of the present rate of taxation or anything like that?

A. Yes.

Q. Now Exhibit 50 is on the same basis, but for the five year period?

A. Yes.

Q. And that gives a return a little smaller, 7.31 per cent?

A. Yes.

Q. And for the year 1910, based on Exhibit 52, your return includes Valley Junction?

A. Yes.

3467 Q. And is based on the operating situation we stated a moment ago?

A. Yes.

Q. And is 7.66 per cent?

A. Yes.

Q. Now, this column headed Year 1910 grows out of the business of 1910 alone? Do you apply that to an average investment?

A. The year 1910.

Q. You apply to an investment of $1,496,789.

A. Yes.

Q. That is an average of what?

A. That is the year December 31, 1909, accepted as one year and the return additions for six months, on the assumption they earned from June 30 on.

Q. Now, then, you have got the year 1910 based on Exhibit 54 which is Des Moines, including Valley Junction, and making the additions that are shown on Complainant's Exhibit 54 on account of depreciation, accident, insurance, expenses of collection and rate regulation.

A. It was all your additions.

Q. And that including Valley Junction gives a net return of 6.15 per cent?

A. Yes.

Q. Did you carry that out and find out what that net return would be for the same year, upon the same basis, but excluding Valley Junction?

A. Yes.

Q. Is it here?

A. Underneath that table.

Q. It would be 6.01 per cent?

3468 A. Yes, assuming Valley Junction is $45,000 and that the expenses of manufacturing and distributing from Valley Junction would be the same as Des Moines.

Q. Then this second line of Exhibits 49, 51, 53 and 55 are upon the same basis as the line above, except Valley Junction is excluded.

A. Yes.

Redirect examination by General BYERS:

Q. And these computations in Exhibit 36 are based upon 90 cent gas?

A. Yes.

Q. And without any estimate or without reference to any possible increase of sales or anything of that kind?

A. Simply on what the Company did, accepting the costs for Valley Junction the same as Des Moines.

Q. I don't want to annoy you again about Exhibit 35, but the testimony as it stands now might be misleading, would be to me, before I had the benefit of this long experience, I want to see if I cannot clear it up a little. Exhibit 35 shows, as I understand you, exactly what you said yesterday; you started out to get for the city

the construction cost of the Des Moines Gas Company's plant as shown by the books?

A. Yes; the books of the Des Moines Gas Company and the books of the Valley Junction Company, but ignoring altogether the sale.

Q. I am not talking about the sale now; simply what I want to get into the record, clear and definite for once, if possible, is the fact that this figure $1,994,314.09 shows the sum total of the investment in the construction of the property as shown by the books of the Company?

A. Yes, including in that item the construction as shown
3469 by the books of the Company, including in that an item called construction account and the item of appreciation referred to yesterday $134,000 and the bond discounts.

Q. In other words, that figure shows, that $1,994,314.19 shows every dollar of money that the Company's books indicate went into the plant in addition to the items you say was without consideration and without money?

A. Yes; I have got to add, to treat that clear, and ignoring the transfer of interest from the Capital City Gas Light Company to the Des Moines Company.

Q. What I am trying to get at now, to have it clear in the record, is the amount of the actual investment in the plant as shown by the Company's books without reference to this over-night transfer?

A. That is all right; that is it.

Q. That is the amount?

A. Yes.

Q. $1,994,314.09?

A. Yes.

Q. Now, then, the $264,108.78 the sum by which you reduce that total to $1,730,205.31 represents that amount of the investment that was taken out?

A. Yes, or the reduction of the investment on the books.

Q. In other words, if this con-rn were just starting and had just opened its books and had credited up to capital in actual money that had just gone into the business, including into the physical property and into the till or treasury, the books show $1,994,314.09 had gone in, and then they had taken out of that, all that amount out of the till, or profits, or rather out of the plant, the $264,108.78,
3470 thereby reducing the amount of the investment that much, is that correft?

A. No, that is not just exactly right. You are taking into consideration the question of cash in the till. This is the amount of cash and the other items which went into the construction of the physical properties.

Q. This $1,994,314.09?

A. Yes.

Q. What is the $264,000?

A. Is the writing off of the value of that $1,994,314.09 on the books of the company.

Q. What did it represent if anything according to the books?

A. It is not stated; the assumption is it's the depreciation of the properties.

Q. When you said it was not depreciation the other day, all you meant to say was, that wasn't what they called it?

The MASTER: That $264,108.78 credited to profit and loss if it were distributed to dividends would have changed the physical investment of the property?

A. Had they distributed that in dividends and not placed it to the credit of the construction account, the investment would still remain $1,994,314.09.

Q. In other words, they used that much of their profits in paying for the physical development of the property?

A. As a matter of fact that is where the profits went, but this sum $264,000, I cannot interpret it as writing down of the book value of the assets.

Recross-examination by Mr. GUERNSEY:

Q. That book value begins—when this charge was made
3471 and written down was $1,994,314.09?

A. Yes, sir.

Q. Aren't you mistaken about that?

A. That one item does not appear in any one set of books; this is a composite figure prepared from the two sets of books.

Q. You- book value begins when that $264,000 was written off?

A. Four million, one hundred and something.

Q. So that the books don't show anything written down as that?

A. That figure is not on the books.

Q. To get at this actual investment again, the situation is a good deal like this, isn't it: Suppose a man bought a lot for five thousand dollars and built a house on it for ten thousand dollars and carried that forward twenty-five years, making additions, so that he had $25,000 there; then I paid $50,000 for that in notes and mortgage and so on, and then I added $50,000 to the property; you on this basis would figure the cost of that property to me at $75,000?

A. Oh, no; the cost of your house is $100,000.

Q. If you adopted this basis here you would say my investment was $75,000?

A. I would say the composite of $75,000; the composite investment of both parties was $75,000.

Q. All I wanted to illustrate was whether or not this $1,194,314.09 represented what is equivalent to what I call my investment there; it does not, does it?

A. It does not.

Q. It does not represent the cost of this property to the Des Moines Gas Company?

A. No.

Q. Does that $1,994,314.09 includ*ing* that $100,000 for a holder?

3472 A. It does not.

Q. Does it include the $45,000 for Valley Junction?

A. Yes.

Q. Where is that in there?
A. In the last section of the table.
Q. Add that $120,000 to it?
A. $2,114,314.09.
Q. You would have to add that to be fair?
A. On the assumption the holder went in.
Q. There is no dispute about that, is there?
A. I haven't heard it.
Q. What? Any dispute at all?
A. This, however, is by the books, and the holder is not in the books.
Q. Where do you find Valley Junction on the books?
A. It is referred to in the agreement, or in some document; it is referred to somewhere.
Q. Do you think in view of all the circumstances that it is really a safe proposition to just blindly accept what you find on the books that way, if it doesn't pay any attention to a little item like $120,000?
A. There seems to be something wrong with the books.

Redirect examination by General BYERS:

Q. What writing on the books there was aside from this $240,000 in either up or down, were principally up, wasn't it?
A. What $240,000?
Q. I mean $264,000?
A. That is the only writing down I notice.
Q. But there was considerably writing up?
3473 A. There was some.

Recross-examination by Mr. GUERNSEY:

Q. Let me ask you another question. Counsel asked you a question something like this: he asked you whether this $1,994,314.49 was not the amount that the Company would have put on the books if it was putting in their actual investment in the property. You remember a question something like that?
A. I remember it.
Q. You assented to it?
A. On the assumption that this is one plant, dealing with one thing.
Q. Let us not make any assumption; let us take the facts as they actually existed. Assume they were the facts, is that the amount you would put on the books?
A. Not of the Des Moines Gas Company.
Q. That is the Company we are talking about. You would put on the books just exactly what appears there?
A. Yes, what I intended counsel should understand was that this was one plant, one continuous operation from beginning to end and no sale, that would be the opening figure I would take.
Q. You would have to have a sale to get an opening figure?
A. Not when you are constructing your final figure and you are opening for operations.

Q. You referred to this over-night sale; what did you mean by that?

A. I didn't say anything about an over-night sale.

Q. Don't most sales occur some time and immediately before the sale — it has not taken place, and immediately after — it has?

A. As soon as you sign them in.

Q. Nothing abnormal or peculiar about that?

3474 A. I didn't remark there was.

Q. I wondered what the significance was, you seemed to assent to it?

A. I don't think the words were mine.

Q. But you assented to them. Now, then, this $264,108.78 was written off of the book value?

A. Yes.

Q. Then that entry did not affect in any way the actual investment shown by the books, did it?

A. It was written off the book value and consequently reduced it.

Q. You distinguish between book value and actual investment?

A. Yes, there is a very considerable difference.

Q. It was not written off the actual investment?

A. No.

Q. It did not affect the actual investment shown by the books a dollar?

A. Not a dollar.

Excused.

3475 E. C. PEASE, being first duly sworn on behalf of Defendants, examined in chief by R. O. Brennan, Esq., testified:

Q. What is your name?

A. E. C. Pease.

Q. Where do you reside?

A. On the east side of the river.

Q. How long have you lived in Des Moines.

A. About forty-five years.

Q. During the forty-five years of your residence in the city of Des Moines, what has been your general business?

A. Real estate.

Q. How extensively have you dealt in real estate in the city of Des Moines during these forty-five years in a general way?

A. I have been continuously in the real estate business for a little over forty-one years.

Q. In which part of the city do you maintain your office?

A. East side.

Q. How long have you had your office in east Des Moines?

A. Practically all the time.

Q. And what is the character of the real estate in which you have dealt?

A. Mostly east Des Moines property.

Q. And does that include business properties as well as residence property?

A. Yes, sir.

Q. And have you bought and sold property for yourself and others during those years?

A. Yes, more particularly others than myself, especially
3476 in the last ten years.

Q. Have you acquainted yourself, Mr. Pease, with the reasonable market values of property in the city of Des Moines?

A. Yes, sir; more especially on the east side.

Q. And that acquaintance with values has extended over a series of years?

A. Yes, sir.

Q. You have endeavored to keep in touch with the value and the range of prices in real estate?

A. Yes, sir.

Q. In the market?

A. Yes.

Q. Are you acquainted with the property owned by the Des Moines Gas Company in east Des Moines?

A. I am.

Q. Are you acquainted and have you been with that property for a number of years?

A. Yes, sir; all the time I have been there.

Q. And with the property adjacent thereto?

A. Yes, sir.

Q. Have been familiar with the sales of properties in that vicinity?

A. Yes, sir; largely.

Q. What do you say to the Master whether or not you are familiar with the values of real estate in that portion of the city?

A. I think I am, sir.

Q. Did you at the request of counsel for the defendants in this case examine the properties of the Des Moines Gas Company with a view to placing a valuation thereon?

A. I did, sir.

Q. About when did you make that examination?

3477 A. Day before yesterday.

Q. And did you examine the properties as shown on the plat Complainant's Exhibit 5 to which your attention is now called, that is to say, the properties inclosed in the red borders?

A. Yes, sir.

Q. Are you prepared at this time to tell the Master what those valuations are?

A. I am, sir.

Q. Exclusive of the buildings or improvements?

A. Yes, sir.

Q. Now, then, Mr. Pease, referring to Complainant's Exhibit 5, I want to call your attention to Lots 3 and 4 in Block K of Scott & Dean's Addition to Fort Des Moines, and you will please state what in your opinion is the reasonable market value of the lots to which I have called your attention?

A. Lots 3 and 4 in Block K, 132 front feet, $75 per front foot, $9,900.

Q. Now going to Lots 9 and 10, Block M, as shown upon the plat, Exhibit 5, tell the Master what in your judgment is the reasonable market value of those lots?

A. 132 feet, $30 a front foot, $3,960 on the south side of Elm Street.

Q. The 132 feet on Elm Street, that is Lot 9, what is the frontage upon Second Street?

A. 132 feet.

Q. 132 feet square?

A. Yes.

Q. Going now to the lots shown upon Exhibit 5 in Block C, being Lots 1 to 10, both inclusive, please tell the Master what in your opinion is the reasonable market value of the lots
3478 to which your attention has been called, and described in Block C as shown on this plat?

A. Lots 4, 5, 6, 7, and 8 in Block C, 280 feet, $90 a front foot $25,200.

Q. Now the other lots?

A. Lots 1, 2, and 3 in Block C, 140 feet, $75 a front foot, $10,500; Lots 9 and 10, Block C, 140 feet, $65 a front foot, $9,100.

Q. Does that include all the lots in Block C from 1 to 10 both inclusive?

A. Yes, sir.

Q. Now, referring to Lots 3 to 10, both inclusive, in Block B of Scott & Dean's Addition, shown upon Complainant's Exhibit 5, tell the Master what in your judgment is the reasonable market value of those lots?

A. 9 and 10, 140 feet, $60 per front foot, $8,400; Lots 3, 4, 5 and 6 in Block B, 192 feet, $70 a front foot, $13,440.

Q. In Block B, have you given the valuations of Lots 3, 4, 5, 6, 7, 8, 9 and 10?

A. Lots 3, 4, 5, 6, 9 and 10.

Q. And Lots 7 and 8, have you those in Block B?

A. No, I haven't got 7 and 8.

Q. You haven't got 7 and 8?

A. No. (Refers to plat.)

Q. What in your judgment, Mr. Pease, is the reasonable market value of Lots 7 and 8 in Block B, Scott & Dean's Addition as shown upon the plat.

A. $60 per front foot.

Q. How many feet?

A. 66 and 74 feet.

3479 Q. That would be 140 feet?

A. Yes.

Q. On East Second Street, and 140 feet on Market Street?

A. Yes.

Q. That would be $8,400 in the aggregate?

A. Yes.

Q. Did I ask you about Lots 9 and 10 in Block M?

A. Yes.

Q. Now, referring to the lots shown on Exhibit 5, being located

in Block T, Scott & Dean's Addition, being Lots 3, 4, 5, 6 and 7, state to the Master what in your judgment is the reasonable market value of those lots?

A. $20 per front foot.

Q. How much per front foot?

A. $20—$4,000.

Q. If I have carried your figures correctly the total aggregate value of the property to which I have called your attention is $92,900.

A. Yes.

Q. You have been acquainted with the values of property in that part of the city for a number of years?

A. I think so.

Q. And have kept in touch with the sales in that part of the city?

A. I have.

Q. Covering forty-one years of experience which you have had?

A. Yes.

Q. You tell the Master now, do you, Mr. Pease, in your judgment $92,900 period represents the reasonable market value of the real estate and property to which I have called your attention, exclusive of the buildings and improvements thereon?

3480 A. Yes.

Cross-examination by W. L. READ, Esq.:

Q. Did you consult or confer with any one over the matter of the valuation of these lots?

A. Some time ago I had a talk with Mr. Mathis.

Q. That is F. A. Mathis?

A. Yes.

Q. One of the witnesses in this case for the city?

A. Yes.

Q. Did he give you his views with respect to the value?

A. Well, yes, he talked with me about the values and estimates.

Q. Was your conference with Mr. Mathis after or before he testified in this case?

A. Before and after; I told him his prices were too high——

Q. Don't mind about that—you conferred with him both before and after?

A. Well, I was in the office and there was several real estate men there talking the matter over.

Q. Who was in the office and participated in the talk ?

A. I don't remember now; there was several in there.

Q. Mathis was there?

A. Yes.

Q. Who else?

A. I couldn't say; there was several in there.

Q. Whose office was it?

A. I think Mathis' office.

Q. You had gone there for what purpose?

A. I just happened in there; I wanted to see another

3481 party; there was several in there and I stopped in.

Q. You cannot recall now what other persons were there?

A. No, I couldn't say; I didn't pay much attention; I know there was several in the office.

Q. Do we understand you had been in the real estate business in Des Moines forty-one years?

A. Yes, sir.

Q. Living on the east side all the time?

A. Yes, I lived one year on this side of the river.

Q. What year was that?

A. I can't say now what year it was.

Q. How long ago was it?

A. Well, I think it was——

Q. It must have been about forty years ago?

A. I couldn't say; it was so long ago, I couldn't say.

Q. You have lived in East Des Moines how long, continuously?

A. Well, forty-two years, with the exception of one year; probably about forty-three years.

Q. In all that time have you engaged in any other business than the real estate business?

A. No, not to speak of.

Q. Didn't you have a millinery store for a while?

A. No, sir; never did.

Q. On East Sixth Street?

A. No, sir.

Q. There was a Pease store over there?

A. Yes, sir.

Q. That wasn't you?

A. No, sir.

Q. Wasn't you connected with it?

3482 A. Well, I happened in there; my wife run it, but I had no interest in it whatever.

Q. Your real estate activity has been on the east side?

A. Yes, sir.

Q. Exclusively?

A. Well, pretty near, yes; I have done a good deal of business on the west side, but I do not claim to be posted much in west side real estate.

Q. Where is your office now?

A. I have my office at my house now, 911 Des Moines Street.

Q. Your office has been in your house all these years?

A. Oh, no.

Q. You now have your office in your house?

A. Yes.

Q. Where is it?

A. 911 Des Moines Street.

Q. That is not within the business section at all?

A. Very close.

Q. Well, there are no business houses in that vicinity?

A. Not in that block.

Q. The business center is down on Fifth Street, isn't it, or Sixth Street?

A. Yes, Sixth Street.

Q. How long has your office been in your house?
A. Oh, about probably four or five years.
Q. Hasn't it been there longer?
A. I think not; I couldn't tell without looking.
Q. You have not maintained a down town office much of the time in the last forty years?
A. All the time, excepting this last time; I have been —
3483 Coberger Block over the Bank.
Q. Officing with some one?
A. I had an office, roomed part of the time with Stewart, and part of the time in partnership.
Q. You have not maintained much of an office?
A. I had a regular office.
Q. You had a desk and a chair, that is all?
A. I had my fixtures and everything.
Q. Your fixtures have been a desk and some chairs?
A. Yes.
Q. That is all?
A. How much would you want?
Q. That is all.
A. I have had all necessary to carry on a real estate business.
Q. That is all anyhow, whether enough or too much?
A. Yes.
Q. Has your dealing in real estate in East Des Moines been for yourself or others?
A. Mostly for others.
Q. Have you bought and sold anything in the last year for yourself?
A. No.
Q. What have you bought and sold on your own account in the last twenty years?
A. I couldn't tell you without looking at the books.
Q. In the last ten years?
A. I couldn't tell you.
Q. In the last five years?
A. I haven't bought anything, I don't think.
Q. What is the character of the property you bought on your own account?
3484 A. Oh, it has been residence property.
Q. Lying way out on Stewart's Addition, north?
A. Oh, no; not much of that.
Q. You have not dealt on your own account with any property lying west of east Fourth Street, have you?
A. No, I don't think I have.
Q. What property have you handled in East Des Moines during the past year, for others, bought or sold?
A. Mostly residence property.
Q. Where is it, what property?
A. I don't know that I could tell you.
Q. How many pieces?
A. I sold several pieces.

Q. How many pieces?

A. I made a sale a short time ago on Locust Street, 45 feet, only a short time ago.

Q. Residence property?

A. No, sir, business—well it is used now as a residence, but it is considered business district.

Q. Where on Locust Street?

A. Between Sixth and Seventh.

Q. What other property?

A. On Maple Street, I sold a place on Buchanan Street; I couldn't tell you without looking at my books. I am busy all the time; sometimes I hit it and sometimes I miss it.

Q. You are busy trying to sell?

A. Yes.

Q. You made no purchase for anyone?

A. No.

Q. All been sales?

3485 A. Yes.

Q. What has been the aggregate amount of sales effetced by you during the last year?

A. I couldn't tell you.

Q. Approximately?

A. I couldn't tell you.

Q. $5,000?

A. I presume so.

Q. More than that?

A. I would think so.

Q. How much more?

A. I couldn't tell you without looking at my books.

Q. Your dealings have not been extensive?

A. They have not been probably as much as some.

Q. They have been comparatively light?

A. No, they haven't been very light; sometimes up as high as $22,000 or $25,000.

Q. In a single deal?

A. Yes.

Q. When was that?

A. The Kenwood Block, for $20,000 and once for $25,000.

Q. Where is that?

A. On Locust Street, the south side of Locust.

Q. Between what streets?

A. Fifth and Sixth.

Q. You made two sales of that within the last year?

A. No.

Q. When?

A. Two years ago, probably.

Q. That is business property?

3486 A. Business property.

Q. Take it in the past ten years, what has been the aggregate amount of your sales?

A. I couldn't tell you without looking it up.
Q. Has your business been extensive or otherwise?
A. I have been quite busy all the time, yes sir.
Q. And principally in residence property?
A. Yes—well business and residence.
Q. But the bulk has been residence property lying on the east side?
A. Both.
Q. Has your principal business been one class of property or the other?
A. Both together; anything I could get a hold of.
Q. Your sales have been principally upon residence property?
A. No, not principally; I couldn't say that.
Q. Your principal sale has been the Kenwood Block?
A. That is, heavy sale.
Q. You never made a sale heavier than that?
A. No.
Q. That is the only one of that class you did make involving so large an amount?
A. Yes, I think that is.
Q. The sales usually involve how much, you have made?
A. About $1,500 and up.
Q. To what; what is the highest price residence property you ever sold in East Des Moines?
A. I couldn't tell you that.
Q. Approximately?
A. I couldn't tell you.
Q. $3,000?
3487 A. Certainly more than that; I couldn't tell you without looking over my list.
Q. What principal sales of residence property have you made in East Des Moines?
A. $4,000 anyway.
Q. What property was that $4,000.
A. I sold the Wilkins property of East Ninth Street for $4,000.
Q. That was when?
A. I couldn't tell you.
Q. Do you recall any other sale involving so large an amount?
A. I might pick it out.
Q. Think just a minute.
A. Pretty hard to think—I have a list of sales on my books; yes, I believe I had one $6,300; I could pick out a good many in the course of a day.
Q. The sales in East Des Moines have been chiefly of small properties?
A. Both, Mr. Read, both.
Q. Have most of your sales been high-priced property or most of the- low-priced property?
A. Well they have been what I call bar*a*gins, all of them pretty near; that is what I work on, bargains.

Q. Your mind runs to the bargain counter proposition?
A. I would like to sell property a man wants to sell.
Q. And wants to sell real badly; that is naturally so?
A. Yes.
Q. And the price is unusually low?
A. Well I like to get it as low as I can, yes, sir, that helps me.
Q. You make an easy sale then?
A. Yes.

3488 Q. You have been dealing in low priced properties, relatively low bargain counter properties.

A. Well, that——
Q. You are naturally pretty conservative?
A. Well, I don't know.
Q. Your mind sort of runs naturally that way?
A. Some might think so.
Q. Isn't that your reputation?
A. Nobody ever told me that.
Q. You are conscious of your conservatism?
A. It is natural for an agent to work on something he thinks a pretty good bargain.
Q. When you find a man who wants to sell and he is conferring with you as to the value, you naturally want to persuade him to take a price that seems to you the one at which he should sell?
A. I have not followed that course. I first find out what a man wants to sell for and then I look up the customer, and if the customer says it's too high and makes a bid, I go back with the bid; if he says he cannot stand that, that ends it.
Q. Prospective buyers—buyers are usually conservative in their offers, are they not?
A. Oh, yes; somewhat.
Q. You never knew of any great liberality evinced by a buyer of residence property?
A. Nor business property either, Mr. Read. A buyer is generally looking for a bargain counter as well as the other fellow.
Q. I wish you would tell us, Mr. Pease, precisely by what means and upon what basis you have fixed the valuations you have placed upon the various properties of the Gas Company?
A. On property that has been sold.

3489 Q. Well, now, what property did you have in mind, what property has been sold which has furnished you with the basis for you- valuation?

A. Well, of course, I don't know that property has been sold lately, of course, I have been in touch with the property down there ever since I lived there. I know generally speaking up to the last few years, property down there has been a hard proposition; it has been on the bargain counter, as you speak of.
Q. It has been a drug on the market?
A. Yes.
Q. Always has, and was that when you first went to East Des Moines?

A. I should say so.

Q. You couldn't give it away hardly?

A. No, sir.

Q. A sort of a yellow dog proposition, so to speak?

A. Just suit yourself about that.

Q. Well, that has been the estimate, or the way in which property has been viewed by East Des Moiners?

A. I don't think agents have spent very much time on that property down there.

Q. You say that has been true up until the last few years; since then there is a change?

A. Yes.

Q. Now, to go back to the other proposition; you said you used as a basis for your valuation of the gas property, sales?

A. Yes.

Q. Now, what sales?

A. A sale on Third Street this summer made a short time ago, of a quuarter block for $8,000.

Q. What quarter block was that?

3490 A. That is the—I guess it is not on that chart—on the south side of the Rock Island and on the east side of Third Street.

Q. Can you show it on the plat there?

A. It is not on the plat. I didn't make that sale myself; I had it and had an option on it for three weeks.

Mr. BRENNAN: Was that the Yaeger property?

A. Yes, sir.

Q. Please describe the property, please take Exhibit 6 and get it from there?

A. I can't see it on there; that is too fine for my eyes.

At this time an adjournment was taken until 9:30 A. M., Monday, September 18, 1911.

VOLUME IV.

DES MOINES GAS COMPANY
vs.
CITY OF DES MOINES et al.

3491 Monday Forenoon Session.

SEPTEMBER 18, 1911—at 9:30 A. M.

Counsel for the respective parties all present.
Testimony on part of defendants resumed as follows:

E. C. PEASE, continuing his cross examination, examined by Mr. Read, testified:

Q. Mr. Pease, we were inquiring about a sale on the corner of East Third and Vibe Streets perhaps; I wish you would identify the property now, if you can—what was the property you then referred to?
A. On Thi-d Street, Third and Vine.
Q. Who was the purchaser?
A. I understand the Yeager Manufacturing Company.
Q. Who was the seller?
A. I don't know whether Mr. Ankeny made the sale personally or not.
Q. Where was the title?
A. In the Oil Company, I suppose; they said they lived in New York; I had it for sale but I didn't make the sale.
Q. You had it for sale from Mr. Ankeny?
A. Yes.
Q. He is the Manager of the Oil Company?
A. I understand it that way.
Q. When was that sale made?
A. I don't know; I never saw any record of it.
Q. When did you have the option?
A. This past summer.
Q. In 1910?
A. It might have been, I am not certain.
Q. You are mistaken, aren't you, it was an earlier date, wasn't it?
3492 A. Yes, an earlier date.
Q. You had an option on that from Mr. Ankeny for how long?
A. Well my parties asked I think a three weeks' option and Mr. Ankeny consented to it.
Q. What was the price under your option?
A. $8,000.

Q. That is a quarter block?
A. Yes.
Q. Now, was there any other sale that you took or considered in forming an opinion as to the price of the Gas Company property?
A. Well, no, I understand that the sale in Block K—I understand that was sold to the Younger Brothers several years ago——
Q. What part of Block K?
A. 3 and 4.
Q. The Gas Company owns it now, don't it?
A. I understand so.
Q. You had in mind then in fixing the basis for the valuation of the Gas Company property what Lots 3 and 4 in Block K sold for some years ago?
A. Well, I don't know that I took that in consideration; the man had an established business there, I don't consider that a fair estimate of the values.
Q. That is also true, isn't it, with respect to the sale of the Yeager Manufacturing Company, that was a very low valuation, wasn't it?
A. I think not.
Q. So you took that as the basis of the valuation of the Gas property?
A. Of course I sold that quarter block where the soap works was several years ago.
Q. What property was that, what lots?
3493 A. I don't know as I can tell you without looking at your plat. I think that is 5 and 6 in L.
Q. 5 and 6 in Block L?
A. Yes, I think that is where the Bolton Soap Works is.
Q. That is in Block K, isn't it?
A. That is right; I was looking at this scale here; I guess that is right, in K; 5 and 6 in K.
Q. How long ago, in what year?
A. I don't remember when they started that works there. I think I sold that at that time for about $1,200 or $1,400, the quarter block?
—. That was how many years ago a good many years ago?
A. Yes.
Q. As much as ten years, wasn't it?
A. Yes, probably, maybe more.
Q. Was it fifteen or eighteen or twenty?
A. I can't say, Mr. Read; I wouldn't say how long ago; I am not good on dates.
Q. Well, you had that in mind then?
A. No, I didn't have that in mind.
Q. What other property did you have in mind as affording you a basis for the valuation of the gas property at the time you made the valuation?
A. Outside of the property belonging to the Oil Company I never have had application for property down in that block.
Q. And that price at which you held the option seemed to you to be a normal price, high enough?
A. Well, I thought it was a good round figure, at least my clients thought it was.

Q. And so you used that as the basis of getting at the valuation?

3494 A. Well, that helped to form an opinion. I made another sale years ago in that block.

Q. Ten, fifteen or twenty years ago?

A. I couldn't say; probably——

Q. You had in mind this Yeager Manufacturing Company and you took into account to some extent the sale you made to the soap people years and years ago, didn't you?

A. In fact there has been no demand so far as my knowledge goes for property down there.

Q. You also took into account the other sale you refer to, made years and years ago?

A. Well that of course——

Q. And from that you formulated in your own mind the basis of the valuation of the gas property—is that right or wrong?

A. Not wholly—in part.

Q. Wherein is it wrong?

A. Because that was so long ago it would not be hardly fair.

Q. You are now referring to these two sales other than the Yeager Manufacturing Company?

A. Yes; but the last two sales, the Oil Company quarter block I think was high water mark.

Q. You think that was high water mark and therefore you took that as the unit, so to speak?

A. Yes, largely.

Q. And from that basis you valued, by comparison valued the Gas Company property?

A. Yes. Of course, that street was paved, you know.

Q. That, you think, would enhance the value of the Yeager Manufacturing Company property?

A. Yes, sir.

3495 Q. So that in your opinion the price on the Yeager Manufacturing Company property, owing to the fact that the street was paved, was too high?

A. I say it is high enough.

Q. You think it was too high as a basis of comparison of the Gas Company property?

A. It is high enough; not too high.

Q. You say the property that the Yeager Manufacturing Company purchased was on a paved street?

A. Yes, sir.

Q. That made the property more valuable?

A. Yes, sir.

Q. And therefore that property was more valuable than the Gas Company property?

A. I think so.

Q. So you didn't value the gas property as high as the price at which the Yeager Company property was valued?

A. Yes, sir; I think I did higher.

Q. Why did you do that?

A. I wanted to give them the benefit of the doubt, if there was

any; some might think that property near the river might be more valuable.

Q. Did you think so?

A. No, sir.

Q. Why did you then add to the value?

A. I knew the demand was for more property near the river; that is, my clients had always thought that way.

Q. Had you ever handled or investigated trackage property, the situation with respect to trackage property in West Des Moines?

A. Oh, yes; in a general way, but not as to prices.

3496 Q. Do you know as to the supply, whether it is limited or otherwise?

A. I understand the last year or two it was somewhat limited.

Q. You understand the demand has been increasing right along and now for the last year there is difficulty in getting trackage property in West Des Moines?

A. I understand so, yes.

Q. Now, had you ever investigated the trackage property situation in East Des Moines with reference — fact that it has trackage property?

A. Yes, sir.

Q. In the district lying between East Fourth Street and the river and between Court Avenue and Market Street, is or is not the supply limited?

A. Court Avenue south?

Q. Yes, West of Fourth Street it is limited, isn't it?

A. Yes.

Q. It is limited, isn't it?

A. Yes.

Q. It is difficult, if not impossible to purchase any considerable amount in one body, isn't it?

A. Yes, I think it is.

Q. A great deal of the property lying in that district is owned by the railroads for railway purposes and not on the market?

A. Yes, that is true as far as the Des Moines Union is concerned.

Q. Isn't that true of the Rock Island and the Q also?

A. Yes, in those blocks it is limited. There seems to be no demand for it now; they are opening up new territory.

Q. Who is opening up new territory?

A. On the Rock Island.

Q. Where?

3497 A. On about Nineteenth, in there by Dean Lake.

Q. That is out as far as Twentieth Street?

A. Well, it is east, yes.

Q. You understood, didn't you, I was inquiring about the district west of Fourth Street and the river?

A. Yes.

Q. And south of Court Avenue to Market?

A. Yes.

Q. Let's talk about that alone then for a while—I am not inquiring about the outside territory; that district is inside, isn't it?

A. Yes, sir.

Q. Now, in making your valuation, I note you took Lots 3 and 4 in Block K?
A. Yes.
Q. And you have placed a valuation of $9,900?
A. Yes, sir.
Q. Now, did you regard that as trackage property?
A. Yes, sir.
Q. All of it?
A. Well, together, the two lots together.
Q. You considered the two lots together?
A. Yes, sir.
Q. What did you consider Lot 3 worth?
A. Well, if I was going to separate them—I took them as a whole.
Q. What did you consider Lot 3 worth?
A. I don't know—in Block K, you mean?
Q. Yes.
A. If you was going to separate them it would not be worth so much?
A. Lot 3 would not?
3498 Q. Why not?
A. Because it would not have trackage frontage.
Q. You valued the lots together?
A. Yes, sir.
Q. And considered it all trackage?
A. Yes.
Q. Now, coming down to Block C, you took Lots 4, 5, 6, 7 and 8?
A. Yes.
Q. Did you value them together?
A. Yes, sir.
Q. All as one property?
A. Yes.
Q. Did you do that with all the groups of lots you have given?
A. Yes, sir.
Q. There was one group, Lots 7 and 8, that you did not value, or had not valued when you came into the court room, wasn't there?
A. 7 and 8 in B.
Q. 7 and 8 in Block B?
A. Yes, sir.
Q. You placed a valuation on them during your examination?
A. Yes.
Q. That was all the time you required for that?
A. Of course, I went over the whole property when I was over there but some way I neglected to include that.
Q. There has been in East Des Moines quite a noticeable increase in values owing to the construction of the new Locust Street bridge, the new City Hall, location of the Park, and the construction of the Walnut Street bridge, hasn't there been?
A. There was on Locust Street for a while, but it seems to have died down.
3499 Q. Well, I mean a permanent enhancement in value?
A. Oh, yes.

Q. Has there been?

A. It has not decreased the value any.

Q. Has the advancement been a permanent one?

A. Yes, I think so.

Q. How much, what per cent?

A. Oh, I think that is very meagre, especially property as far away as this is from Walnut Street.

Q. I am asking you about Locust Street now; I am inquiring how much that property on Locust Street from the river east to Fourth street has enhanced in value since the location of the City Hall and the opening up of Locust Street bridge for the last two or three years?

A. Well, I think it has pretty near doubled that property.

Q. On Walnut Street, how is it?

A. Well, Walnut Street it has added a good deal, but not so much as it will when it is opened.

Q. How much do you think?

A. I don't think it has added Walnut Street more than fifty per cent so far.

Q. How about Court Avenue, has it affected the value on Court Avenue?

A. I don't think so.

Q. So you didn't take into account any enhancement values of Court Avenue property or Vine Street property; you don't think they were advanced any?

A. No, that is a difference class of property.

Q. What do you think is the highest available use of the Gas Company's property, what is it best adapted for?

A. Well, it seems to be well adapted to the use it is being put to.

3500 Q. What other uses could it be put to?

A. It could be used for trackage purposes.

Q. You mean for manufacturing and storage?

A. Manufacturing.

Q. You think it is well adapted for that use?

A. For manufacturing, yes.

Q. You understand inside trackage property in West Des Moines is very limited, don't you?

A. It is controlled practically by one man, pretty near.

Q. That is only available for leasing purposes, isn't it?

A. Yes, sir.

Q. And you understand and so state that trackage property in the district from East Fourth Street west to the river and from Court Avenue south to Vine and Market streets is limited also?

A. Yes.

Q. You have murmured something to the effect that there is not much demand for trackage property?

A. I haven't had it.

Q. You predicate that statement upon your own experience?

A. In part, and talking with real estate men.

Q. When—recently, since this valuation began?

A. Well, in part—yes I have talked with them since this commenced.

Q. Did you consider the Gas Company's property any more valuable because of the quantity, the area in one body?

A. Oh, no; I don't consider it that way.

Q. You don't add anything for that consideration?

A. No.

Q. You regard it as if it were simply so many lots?

A. It is a very nice property.

Q. You regarded it as if it were simply so many lots?

3501 A. I can't say as I did by lots.

Q. How did you regard it?

A. I took it as a whole, in the groups in which I placed it.

Q. Why did you place it in groups?

A. On account of the way the lots lay and the way it is located between the two tracks.

Q. Suppose you had a customer who wanted two blocks and a half of ground in that territory from Fourth Street west to the river and from Court Avenue south to Market, would you have any difficulty in getting it together under one ownership?

A. Yes, sir; there I would.

Q. You couldn't do it, could you?

A. Not there, between the places you speak of, that is without buying established business.

Q. Suppose the Gas Company property was used as the other property in that district is used by established businesses, you would have difficulty in getting two blocks and a half or two blocks and a quarter?

A. Yes.

Q. You would have to pay a high price for it?

A. Yes.

Q. A good deal more than you have valued this property at?

A. Undoubtedly.

Q. Two or three times as much?

A. I have valued this ground, and not improvements. Of course if it was improved——

Q. Well, the improvements, except as the business is an established one, don't count for much on the properties down around there?

A. Well, there is some substantial improvements, for instance the Yeager plant there.

3502 Q. I am calling your attention to these matters in order to inquire whether you regard the gas property as of greater value because of the large body under one ownership, lying contiguously; you say you have not given that circumstance any consideration; shouldn't you have done so?

A. I don't think so, from the fact that there is but very few manufacturing institutions that want so large a tract of ground.

Q. But if there was no Gas Company in Des Moines and a Gas Company should come in here, then it would be a real live question, would it not?

A. Yes.

Q. From that point of view you should have given it consideration?

A. But there is other ground over there south of Elm Street that could be used at a much lower figure.

Q. Do you know anything about the requirements of use for gas manufacturing purposes?

A. No, sir.

Q. Why do you volunteer other ground, you know as a matter of fact that is below high water mark?

A. It is.

Q. And it would have to be filled to bring it above high water mark.

A. Yes, sir.

Q. Filling ground costs money?

A. You bet.

Q. Lots of money.

A. Yes, sir.

Q. That ground down there has no trackage facilities, has it?

A. Well, on the C. B. & Q., it does some.

Q. You couldn't get in there, you would have to go further south than that?

—. —— ——.

3503 Q. I wish you would glance at the card I gave you a moment or two ago. You recognize that picture, do you?

A. Yes, sir.

Q. You recognize in the foreground, first the Gas Company property, do you not?

A. Yes, sir.

Q. To the left is an open space with something piled on it?

A. Yes.

Q. That is the ground in Block T?

A. Yes, but that has not got them pipes on it now.

Q. I am only calling your attention to that ground. To the right are some buildings belonging to the gas plant?

A. Yes, sir.

Q. To the left and across the river is shown the Warfield-Pratt-Howell Grocery property?

A. Yes, sir.

Q. Immediately north of it the Brown-Camp Hardware Building?

A. Yes.

Q. Still north of that property is the Public Library Building?

A. Yes, sir. The Post Office is not shown here, is it?

Q. No. I wish you would take a pencil and make a cross where the Gas Company's property is shown.

A. (Witness makes cross.)

Q. You have made a cross on the property that is embraced within Block T?

A. Yes, comes up here. I don't know that it comes down that far though.

Q. Isn't this the front here?

A. Yes, the ground commences in here.

Q. The property lies in the picture to the right of the cross,
3504 doesn't it, the property marked with a cross?
A. Yes, sir; in Block C you mean—that is Block T in here; this is Block C in here.
Q. The Warfield grocery building, I wish you would put a cross there?
A. Yes. (Witness makes a cross.)
Q. I wish you would make a cross on the Public Library?
A. Yes. (Witness makes cross.)
Q. Lying between the Library and the Brown-Camp Hardware Building is now the new Post Office Building, in here?
A. Yes.
Q. And on the right and east side of the river is the new City Hall, not shown in this picture?
A. No, I think it is not shown here.
Q. The card which your attention has been called to and marked with the crosses indicating the buildings inquired of is now marked Complainant's Exhibit 62, isn't it?
A. Yes, sir.

The MASTER: I understand the location of the Gas Company's property is right immediately south of the Rock Island track on the east side of the river.

Mr. BRENNAN: The Gas Company's properties, yes, and running south down by the Burlington tracks.

The MASTER: And it includes the block south of that also?
A. Yes, sir.

The MASTER: And then further east is where Lots 9 and 10, or in other words the oil tanks are?
A. No, the oil tanks are in Block B; there may be some in C.
Q. Mr. Pease, by whom is the north half of Block A shown on the plat, Exhibit 5, owned, do you know?

(Question withdrawn.)

Q. Do you know the ownerships in that half block?
3505 A. I think the Company owns half of this in there.
Q. You mean the C. B. & Q.
A. No, I think the Gas Company owns some of that. If they don't, it belongs to the C. B. & Q.
Q. The C. B. & Q. owns the north half of the northeast quarter block?
A. It is marked so.
Q. Doesn't the Q. own also the north lot of the northeast quarter block?
A. It is marked that; that is all I know.
Q. You don't know anything about it outside of that?
A. I do not.
Q. Mr. Pease, it is your idea, I take it from what you have said, that actual sales fix the price of real estate?
A. Well, in a measure, that is the only way we can judge—one of the ways.
Q. Accordingly you have judged the value of the Gas Company property by the sale to the Yeager Manufacturing Company?

A. The demand down there is very limited.

Q. Answer the question. So you in fact have valued the Gas Company property on the basis of the sale to the Yeager Manufacturing Company?

A. Oh, yes; largely, well not on that entirely; no sir, on other property there.

Q. What other property then have you used?

A. Well there has property been sold in Block 1—the Shepherd and Nicholas property there was sold.

Q. How lately, when was the sale made?

A. Within a year, I think.

Q. How much property?

A. A quarter block there.

3506 Q. That fronts on what street?

A. On Fourth Street; that is not shown on the plat.

Q. There was a quarter block sold to the Nicholas Shepherd Company?

A. No, sir; from them to the Yeagers; that of course has more expensive buildings on it.

Q. When was that sale made?

A. In the past year; I think this last spring.

Q. In the spring of 1911.

A. I think so; that is my understanding. I had it for sale last year and I couldn't make it; they came on here and took it up.

Q. That was a sale from the Nicholas Shepherd Company to the Yeager Manufacturing Company?

A. Yes, sir.

Q. Of a quarter block?

A. Yes.

Q. At what price?

A. I understand it was $35,000.

Q. That included the buildings?

A. Yes, they claimed, the agent——

Q. Never mind what the agent claimed. All you know about it is what you have been told?

A. Yes, and the price I had on it.

Q. What price did you have on it?

A. Well, my customer wanted time——

Q. What price did you have on the property?

A. I think it was $35,000 or $37,000; I don't just remember.

Q. What other property did you have in mind, what other sales, rather?

A. Well, that has been the only recent sale I can recall; of course there was property back there sold——

Q. So that you had in mind fixing the price largely, the 3507 sale of the quarter block by Mr. Ankeny or the Oil Company to the Yeager Manufacturing Company, and also the sale by the Nicholas Shepherd Company?

A. Well, I wouldn't want to be quited as using the Shepherd and Nicholas property, because that is differently situated.

Q. Then it comes down to the sale of the quarter block of the Oil Company or Ankeny to the Yeager Manufacturing Company?

A. And the other sale made there.
Q. What other sale?
A. I understand, three and four in K, that is the one the Company owns.
Q. That was made some years ago?
A. Yes.
Q. How many years ago?
A. The Gas Company officials undoubtedly know.
Q. Will you answer the question?
A. I can't say.
Q. What is your understanding of it?
A. Well, a few years ago; I don't know how many.
Q. A few years ago?
A. Yes.
Q. Four or five?
A. I wouldn't say.
Q. You had in mind then those two sales as fixing the price over in that vicinity?
A. I had it in part, yes sir.
Q. You say in part, now what was the rest of it?
A. The property in Block C is higher property, the lots are higher and to be considered worth more money.
Q. So you have added something, have you?
3508 A. Yes, sir.
Q. Let us see how the case stands. You took the selling price on the quarter block sold by the Oil Company to the Yeager Manufacturing Company and also the price at which Lots 3 and 4 in Block K sold some years ago, as fixing the basis of the valuation or price.
A. In part, yes sir.
Q. And then you added nothing on account of recent appreciation—in your judgment there has been no appreciation; you added nothing on account of recent appreciation?
A. Why, yes; I think I did.
Q. You just stated as to Lot C, because it is higher ground you considered that more valuable; I mean you add nothing on account of recent appreciation in real estate values in East Des Moines?
A. Well, I certainly did; I certainly have; I understand this property here was sold for $7,000; my appraisement is $1,900 more than that.
Q. Whatever difference you have made over and above the prices as fixed by these two sales, is your judgment as to the appreciations in value recently except as to Block C, and that is filled and a higher level?
A. So is B filled.
Q. Except as to those blocks then on account of filling?
A. Those are filled perfect almost.
Q. You have allowed additional value on account of that?
A. Yes.
Q. You have allowed no additional values on any property by reason of any recent appreciations in value?

A. I think so, yes sir. I think the prices I fixed there are above——

Q. What was the price of the oil property sale to the
3509 Yeager Manufacturing Company in K, how much a front foot?

A. Not the Yeager, you don't mean.

Q. I mean the one you have been referring to in Block K?

A. 3 and 4?

Q. No, I don't mean that. I have been understanding you to say that there was a sale of a quarter block to the Yeager Manufacturing Company; that is in another block, is it?

A. Yes.

Q. It ain't shown here?

A. It is in the block east of K.

Q. Well, what was the price per front foot on that sale?

A. That was 132 feet.

Q. How much would that be a front foot now; what was the total price?

A. $8,000.

The MASTER: That would be $50 a front foot?

A. Yes.

Q. Then the difference in the valuations of the Gas Company property as given by you measures your estimate of the appreciation, does it?

A. Well in part, yes.

Q. That is, aside from the difference on account of Blocks C and B being graded is that right?

A. That is the way we estimate——

Q. Is that the way you estimate the enhancement of its values recently?

A. Of course we estimate our values from the sales largely in any locality.

Q. Let us go back over the ground again. The quarter block in the block east of K sold to the Yeager Manufacturing Company was sold for fifty dollars a front foot?

3510 A. Well, $8,000.

Q. You have placed a higher valuation per front foot on the Gas Company property?

A. Yes.

Q. So far as Blocks B and C are concerned, you regarded them as more valuable because they are located and graded to a higher level?

A. Yes, sir.

Q. But aside from that consideration the difference in the price per front foot between the sales to the Yeager Manufacturing Company in the block east of Block K measures the enhancement in value recently of the property?

A. Why, it don't measure the enhancement.

Q. Measures your estimate of the increased value?

A. I said those lots were higher lots and worth more on that account.

Q. I have just said, aside from the increased value owing to that situation, the difference between the values you placed on these properties measures your estimate of the increased values since the sale to the Yeager Manufacturing Company has been made.

A. I don't think there has been any increased value.

Q. Why did you knock the price up then?

A. Because they are higher lots.

Q. Why did you mark them up?

A. Why that is frontage.

Q. Why did you mark up the values there?

A. I should say I gave a very liberal estimation.

Q. That is your nature and disposition—I want to get at it more intimately. You have said there has been no increase in values over there?

A. I don't think there has been in the last year.

Q. Yet you have given an increase of value over and
3511 above the basis of your sales?

A. Yes.

Q. I am asking you to explain why you did that; As I understand you it was out of extraordinary liberality and generosity on your part?

A. Yes, largely.

Redirect examination by Mr. BRENNAN:

Q. Now, Mr. Pease, your attention has been called to Exhibit 62 that seems to be a panoramic view of certain portions of the Des Moines river, and it appears that the camera which took this picture was located somewhere in the vicinity of the Gas property; this picture shows the east bank of the river on the right hand side of the picture looking north?

A. Yes.

Q. On the west bank of the river are the buildings to which your attention was called?

A. Yes.

Q. The library building, where the new Post Office is now located, and the Warfield-Howell Grocery house and the Brown-Camp Hardware house?

A. Yes, sir.

Q. Now this shows a beautiful picture here of parks and blue roofs and all that sort of thing—does it show Mr. Rubenstein's junk pile near the Second Street bridge; do you see that on the picture?

A. No, sir.

Q. Or the American Iron Works where the boilers are stored out on the river bank?

A. No, sir.

3512 Q. The Capitol Building is not shown on this picture, is it?

A. No, sir.

Q. Well, this is a river view printed on a post card?

A. Yes, sir.

Q. Can you see the battered stacks of the Edison Electric Light Company?

A. Yes, sir.

Q. Where is that?

A. That is up north of the Library Building.

Q. There are no summer resorts that you know of located in this immediate vicinity?

A. I don't recognize any.

Q. Well, now your attention was called, or you stated rather, that the Rock Island Railway Company had opened up a new factory district, or manufacturing district in East Des Moines, just where is that located?

A. Near Dean Lake; I understand they bought 20 or 24 acres there.

Q. What is the fact, Mr. Pease, as to there being at this time available sites for manufacturing purposes in East Des Moines?

Objected to on part of Complainant as being immaterial.

A. Plenty of them.

Q. Just indicate where they are located?

A. Along the Rock Island or Wabash. I am dealing now for 20 acres on the Rock Island, east; there is plenty outside of the existing part of the city.

Q. What is the fact as to there being sites of that character along the right of way of the Chicago Great Western and the Des Moines & St. Paul Railways, running north and in a northeasterly direction?

A. Plenty of them.

3513 Q. Now did you testify anything concerning the property on the northeast corner of First and Court Avenue which was purchased by the Lorenz Ill estate?

A. That is Court Avenue and what?

Q. And First Street, immediately across the street from the Des Moines Manufacturing & Supply Company?

A. I am not posted on that deal.

Q. Do you know whether that was purchased within the last year?

A. No.

Q. You are not familiar with that property?

A. No.

Q. Now this Yeager Manufacturing Company, where is that property which they purchased located?

A. On Fourth and Vine, between Vine and between the Des Moines Union and the Rock Island on Fourth.

Q. It is between the Des Moines Union Railway and the Rock Island Railway?

A. Yes.

Q. Near Fourth Street?

A. Fronts on Fourth Street.

Q. On which side of Fourth Street?

A. On the west side.

Q. How far is it from the gas property?
A. Oh, it would be three or four blocks; about three blocks.
Q. That is from the front?
A. From front street. Well, it would be nearly four, about four blocks I think.
Q. Take it from the east line of the Des Moines Gas Company property, where would the west line of the Yeager Manufacturing Company be?
A. Well, that wouldn't be more than a block I don't think;
3514 taking them two lots in K, it wouldn't be much over a block.
Q. That you say was purchased for $50 a front foot?
A. I have reference to their big building they sold; you have reference to the two lots.
Q. Yes.
A. That would be different. I didn't understand that; I would have to be corrected on that. I supposed you meant the other on Fourth Street.
Q. I mean the property which they purchased recently.
A. Well, take it on First Street, it wouldn't be only two blocks from First Street.
Q. How far would it be from the east line of the property of the Des Moines Gas Company?
A. Just a quarter of a block.
Q. Did you state the price at which that property was purchased by the Yeager Manufacturing Company?
A. $8,000.
Q. How much frontage?
A. 132 feet.
Q. 132 feet square?
A. Yes, sir.
Q. It has trackage facilities?
A. Yes, sir.
Q. On what railroad is it situated?
A. The Rock Island.
Q. The main line of the Rock Island?
A. Yes, sir; on the main line.
Q. Is that the property sold by the Oil Company?
A. Yes, sir.

3515 Recross-examination by Mr. READ:

Q. Mr. Pease, when you said there is plenty of trackage property on the Great Western and the other roads, you referred to property in the outlying districts?
A. Yes, sir.
Q. Away out?
A. Inside of the city limits.
Q. And out a mile or two; Dean Lake is out at Twentieth Street?
A. It is outside of the thickly settled part.
Q. The Yeager Manufacturing Company is not using these two lots now?
A. No.

Q. Just holding them?
A. Yes.

Redirect examination by Mr. BRENNAN:

Q. Mr. Read said a mile or two; the country which is being developed by the Rock Island Railway Company is about Eighteenth street you say?
A. That is out further than that. It would be out about Twenty-second street, I should judge, south of Dean's Lake there; on the south side of Dean's Lake.
The MASTER: That is where the new cut-off is?
A. Yes, sir.
The MASTER: That is on the other side of the river?
A. On the east side.
The MASTER: At what point do they leave and turn south?
A. They leave, this Des Moines Northern I suppose they would be continued south, they have additional ground there, I know, in there to the southeast.
3516 Q. Well, it is a fact, Mr. Pease, as you approach East Eighteenth street between the Des Moines Union and the Burlington tracks, there are what is called crossings there; the Great Western crosses some other tracks at that point and the Des Moines & St. Paul which has been recently acquired by the Rock Island, parallels the Great Western tracks some distance north?
A. Yes, sir.
Q. That is the point you referred to?
A. Yes.
Q. That would be about East Eighteenth Street or Twentieth Street?
A. The crossing would be about Twentieth Street, yes.
Q. The Rock Island and the Wabash and the K. D. division run parallel to each other, and the Great Western crosses the tracks at or about that point, going in a northeasterly direction?
A. The Great Western I don't think crosses the other tracks.
Q. It is north of these other tracks?
A. It is north.

Recross-examination by Mr. READ:

Q. What is it you say is being done out there?
A. Well, the ground the Rock Island lately purchased, I understand, on Deans Lake,—you know where Deans Lake is I suppose——
Q. What has been done, what has it been purchased for?
A. For the Rock Island.
Q. For what use?
A. That I couldn't say.
Q. What have you been telling us here?
A. I suppose they done it for trackage.

Q. You supposed that; that is all the information you
3517 have?

A. Yes.

Q. Just your own inference?

A. Yes.

Q. Don't you know the Rock Island is making a terminal site, is buying it for a terminal site for the new Des Moines & Mason City & St. Paul line?

A. Well, I don't know.

Q. Don't you know the company has been buying a small piece of ground from the Street Railway Company for the purpose of establishing a terminal site out there?

A. I understand the Soap Company has bought a piece of ground out there?

Q. What Company?

A. The Prouty Soap Company.

Q. What did you infer from that?

A. The Prouty Soap Company, I understood in the last few days, has bought three acres out there or such a matter.

Excused.

Complainant offers in evidence Complainant's Exhibit 62, being the post card identified by the witness.

Objected to on part of defendants as incompetent, irrelevant and immaterial.

3518 ANDREW SANGSTER, being first duly sworn on part of defendants, examined in chief by H. W. Byers, Esq., testified:

Q. Where is your present residence?

A. In Chicago.

Q. How long have you lived there?

A. Since January of this year.

Q. Of what country are you a native?

A. Scotland.

Q. How long have you been in this country?

A. Since January.

Q. Have you ever been on the witness stand before?

A. No, sir.

Q. What is your occupation or business?

A. I am a chartered accountant.

Q. How long have you been such?

A. Since 1905.

Q. I wish you would state into the record in your own way just what training and experience you have had as a chartered accountant?

A. I entered the profession in 1897 and became an apprentice or was indentured in 1902; I qualified in 1905 and became a member of the Edinburg Society of Chartered Accountants in Scotland. Since that time I have been employed taking charge of private and public companies, such as commercial, industrial and financial, and

in making investigations in the accounts of companies, proposing to offer shares to the public, that is to say, inquiring into the profit and loss accounts of these companies for the purpose of certifying the profits over a period of years.

Q. As I got it, you commenced your training as an ac-
3519 countant in 1902?

A. Yes; well I have been in an accountant's office since 1897. I did not go in for the qualification until 1902.

Q. With whom are you employed now?

A. Marwick-Mitchell & Company of Chicago.

Q. How long have you been with them?

A. Since I came to this country.

Q. What are your duties with Marwick-Mitchell & Company; what part of their work do you do?

A. Much the same as I have described: taking charge of auditing and investigation work.

Q. Since you have been here in this country, have you been engaged in the business of examining and investigating books and records of companies and corporations and municipalities?

A. Yes, sir; ever since I have been busily engaged in that work.

Q. When did you first come to Des Moines?

A. July 14.

Q. And for what purpose did you come here?

A. For the purpose of making an investigation of the accounts of the Des Moines Gas Company and the Capital City Gas Light Company.

Q. Under whose supervision did you, or rather at whose direction did you come to Des Moines?

A. At the direction of Mr. James Hall, senior partner of Marwick-Mitchell & Company of Chicago.

Q. That is the Mr. Hall who testified here?

A. Yes, sir.

Q. What if anything have you done in the way of examining or investigating the books and records—I don't mean in detail now; as to whether or not you have examined and investigated the books and records of the Des Moines Gas Company?

3520 A. Yes.

Q. What part of that work did you have in charge, if any part of it—were you at the head of the force that was here?

A. Yes, I was in charge of the work.

Q. How many helpers did you have?

A. Three.

Q. Who were they and who were they working for?

A. They were also in the employ of Marwick-Mitchell & Company.

Q. What do you have to say as to whether they were competent young men for the work they were doing?

A. In my opinion they were quite competent for the work which was entrusted to them.

Q. You say you came to Des Moines on the 14th of August?

A. The 14th of July.

Q. Now I wish you would state to the Master just the scope of your examination and investigation of the books and how much of it you inspected and checked yourself?

A. The scope of the work included the following: Prepared all balance sheets of the Capital City Gas Light Company as of July 1, 1886, and January 1, 1895; balance sheets as at February 28, 1906, of the same company; a series of balance sheets of the Des Moines Gas Company as at March 1, 1906, February 28, 1907, 1908 and 1909, and December 31, 1909, and 1910. These last being shown in the exhibits to Mr. Hall's report, Exhibit 30 I think. The additions to the plant since January 1, 1895, which was taken as a starting point, were analyzed; so also were the additions to the plant under the operations of the Des Moines Gas Company, and these latter additions were vouched or checked. Analysis was also made of the profit and loss accounts of the Des Moines Gas Com-
3521 pany for the five years ending December 31, 1910. I think that includes all of it.

Q. In what way, if at all, was this examination and investigation and the analysis that you refer to worked out, that is, was a complete written memoranda of the work made?

A. Yes, there was.

Q. What do you have to say as to whether that memoranda is contained in the report furnished by Mr. James Hall and marked in this case as Exhibit 30?

A. These are all contained in that report.

Q. Now did this examination and investigation cover all of the accounts of the Des Moines Gas Company from 1906 down to December 31, 1910.

A. Yes, sir.

Q. And what do you have to say, whether it covered every item of either charge or credit that appears upon the books?

A. It embraces all entries on the books.

Q. And was complete as to every item?

A. Yes, sir.

Q. Now, in this examination, you may state what you have to say as to whether or not you made up tables for the purpose of determining the cost of the manufacture of gas and all of its details and reduced the same to schedules and writings?

A. I did.

Q. How much, if anything, did you have to do with making up Exhibit 30, that is, Mr. Hall's report?

A. I prepared all of the Exhibits and schedules shown in that report and which formed the basis for the report.

Q. What do you have to say, whether you personally checked those items and since have checked them back with the books, so that you know they are correct as they appear in that Exhibit 30?

3522 A. I did so, either personally or it was done under my direction.

Q. What do you have to say as to whether they are correct as they appear in that report?

A. They are correct, subject of course, to the adjustments which Mr. Hall made.

Q. I am referring to the matters that purport to have been taken from the books?

A. Yes, sir; those are correct.

Q. Now how much time have you devoted to an effort to check up all these items to be sure that nothing had been overlooked and nothing had been added, aside from these adjustments you are talking about?

A. You mean as to time?

Q. I want to know how diligent and how much effort you put forward to furnish Mr. Hall an accurate statement of the books and records and accounts?

A. Well, I used every care and caution in the work consistent with my experience.

Q. After the thorough examination of Mr. Hall, especially the cross examination, and the time he devoted here upon the witness stand, as the character of his report developed, were you watching it to check up errors or mistakes?

A. I was.

Q. How many did you find?

A. With one exception, I didn't note any.

Q. And that exception was as to the item of loss and damages that was set back into some former period?

A. Was not set back.

Q. Now, in examining these books, Mr. Sangster, I wish you would state whether you found upon them continuous running accounts, both as to the Capital City Gas Light Company and the Des Moines Gas Company, with the U. G. I., the United Gas Improvement Company?

3523

A. Yes, the books were a continuous record of the transactions of the company.

Q. You do not quite catch the drift of the question, I think, Mr. Sangster, although the answer is perhaps sufficient. What I wanted to know is as to whether or not you found on the books a continuous open account, first with the Capital City Gas Light Company and then later on with the Des Moines Gas Company, of the United Gas Improvement Company?

A. Yes, I did.

Q. Did the books and records of the Des Moines Gas Company apply alone to the city of Des Moines, as you found them, or did they cover Valley Junction as well?

A. They covered Valley Junction.

Q. And so far as the journals and ledgers and account books or records were concerned, did you find any place where the operations applying to Valley Junction were separated from the Des Moines operations?

A. Not in any of the books which I examined.

Q. That is to say, the record of the amount of gas manufactured does not show the amount for Valley Junction and the amount for Des Moines?

A. Oh, yes; as regards gas statistics they are quite clearly stated distinctly for Valley Junction.

Q. That is the amount of gas furnished?

A. Yes, sir.

Q. Now with reference to the accounts, general expenses, office expenses and manufacturing and all that class of expenses, and
3524 distribution, is that made up in the books separately, so that you could tell what should be charged to the Valley Junction end of the business and what should be charged to Des Moines?

A. No, it is not stated separately, and I don't see how they could arrive at any distinct proportions to be charged against Valley Junction.

Q. First state in the record, just what item, if any, aside from the gas statistics, you found recorded in the books anywhere that applied alone to Valley Junction?

A. Apart from these gas statistics I don't think there was anything in the books which showed an expenditure properly applicable to Valley Junction.

Q. What was there, if anything, on the books with respect to the Valley Junction plant? Do you remember any item?

A. Apart from the $45,000 paid for the plant *in* March 1, 1906, there was nothing else.

Q. Now in going through the books of the company, what if anything did you find from them indicating the payment to the city of Des Moines of a tax on gross sales?

A. Special city tax?

Q. Yes.

A. That was paid regularly.

Q. You found such an item, two cents?

A. Two cents.

Q. On the gross revenue?

A. On the gross receipts rather.

Q. That was not separated from the Valley Junction business, was it in any way?

A. No, not in the books.

Q. So that the tax, as you understand it, was paid upon the
3525 entire output?

A. Yes.

Q. Did you find anything in the books anywhere—I am speaking of the books now, the regular office books, account books and the books showing the cost of material and manufacture—what if anything did you find in the books that would indicate, either to you, or could be pointed out to us, as to the character and extent of the extensions that have ben made to the Valley Junction plant in the last five years, any charge in the general account of the Des Moines Gas Company?

A. On the books, I find nothing which would indicate to me how much of the construction account applied to Valley Junction.

Q. Now did you think to go into the authorizations that are filed there in the office to try to get the character and extent of the additions and extensions to the Valley Junction plant in the last five years?

A. No, I did not.

Q. Your attention up to this time had not been called to the fact that information might be gotten in that way?

A. It didn't occur to me.

Q. I wish you would, for me, after you are through with the witness stand, refer to the authorizations that you find up there, unless I am mistaken, as to what they show or they will indicate on their face the character of the improvements and the streets on which the improvements are to be made. I think you can tell from the street, with some help, whether it is in Des Moines or Valley Junction.

I would like to inquire whether the Des Moines Gas Company minute book is here?

Mr. GUERNSEY: I think it is.

(The minute book is produced.)

3526 Q. The book I just inquired about is Exhibit 27. Now I will call your attention, Mr. Witness, for the purpose of aiding me in getting me that further information in this Exhibit 27, which is the Des Moines Gas Company No. 1 Stockholders' and Directors' Meetings, you will find carried through it what I assume to be copies of these authorizations. To illustrate, I find one here referring to certain mains on East Seventeenth Street, Vail Street, Raccoon, East Eleventh, Logal, Hillside, Bloomfield Avenue, and so on. Do you remember whether anywhere in the books there is anything to indicate just where these meters go that are entered up in the totals, whether to Des Moines proper or Valley Junction?

A. There was nothing to indicate.

Q. Whatever information you can get along that line for me later on, I wish you would get. Now you have stated, you prepared an abstract of the books covering the five year period of the Des Moines Gas Company's operation, that is, such of the five years as you have covered up to the 31st day of December, 1910, for the purpose of making an analysis of what the books show and ascertain the cost of manufacturing and distributing gas in Des Moines. Now in addition to that have you prepared tables and figures covering a period of some years back of 1906 beginning with the existence of the Des Moines Gas Company, for the same purpose, of working the cost for manufacture and distribution price to that period?

A. Yes, for the years 1904 and 1905.

Q. To whom did you furnish those figures?

A. To Professor Bemis.

3527 Q. Now did you go over these tables and assist in making up these figures and schedules and the analysis of the cost for manufacturing and distributing gas as they appear in Exhibit 30?

A. Yes, I prepared these exhibits myself, or checked them where I did not prepare them.

Q. What do you have to say as to their being correct?

A. They are correct as taken from the books.

Q. Now did you have any conversation with the managing offi-

cers of the Gas Company about what you wanted to do and as to the books and papers you wanted to examine and so on?

A. Yes.

Q. What do you have to say, whether they understood perfectly what you were there for, and you explained it to them, did you?

A. There was no doubt in my mind they understood the purpose of my visit to that office.

Q. I suppose whatever you asked for they furnished to you?

A. Yes, except where we may have stated to the contrary in the report; Mr. Hall may have stated to the contrary in his report, that certain productions were not produced to us.

Q. Well, as I remember it, about the only thing of importance was the item of $120,000 that involved, or rather one of the holders down here?

A. Yes; the particulars of the claims for accidents and damages were not produced until this report was practically completed.

Q. Aside from that they furnished you what you asked for, that you thought was necessary to make a complete transcript or abstract of the books of the company?

A. Yes.

Q. For the purpose for which you were directed to make the examination?

A. Yes.

3528 Q. Is that right?

A. That is right.

Q. What do you have to say as to whether Exhibit 30 as made up by yourself and Mr. Hall and the other young men that you had charge of, does show in the figures and tables and schedules and exhibits attached thereto the cost of manufacturing and distributing gas at this plant here as it is shown by the books of the Des Moines Gas Company?

A. Yes, they show these costs as made up from the figures taken from the books.

Q. What do you have to say as to whether Exhibit 30 contains a complete and accurate transcript in these numerous tables and schedules and exhibits of all of the book entries of the Des Moines Gas Company so far as you were able to find them, showing the investment in the property of the Des Moines plant?

A. They do; subject to the adjustments made and stated by Mr. Hall in his report.

Q. Well not subject—these adjustments of course are in addition to what the books show?

A. Yes.

Q. But the report is a complete and accurate abstract of the books and all of the entries as they relate to the cost of distribution of gas as appears in this Exhibit 30?

A. That is so.

Q. Did you make some inquiry about this holder that has been referred to several times or did Mr. Hall do that?

A. Yes, I did that myself; Mr. Hall may have made certain inquiries in addition.

Q. To whom did you direct your inquiry?
A. To the comptroller.
3529 Q. That was Mr. Curran?
A. Mr. Curran.
The MASTER: He resides here or in Philadelphia?
A. Philadelphia, I believe.
Q. What relation do you understand Mr. Curran bears to the United Gas Improvement Company?
A. I don't know just what position he holds with the United Gas Improvement Company.
Q. You call him comptroller; is he comptroller of this company or the United Gas Improvemnt Company?
A. As I understand it, he is comptroller of the auditing department of the United Gas Improvement Company.
Q. What response did Mr. Curran make to you about the holder?

Objected to on part of complainants as secondary and hearsay and not competent as against this company.

A. He said he thought there must be some contracts outstanding including this holder which was not shown on the books; he had no information.
Q. And since then have any of the managing officers of the company furnished you any further information about it or assisten you in any way trying to ascertain the truth about the holder its cost and so on?
A. No, nothing.
Q. Now in going through these books, can you tell me from memory now just what amount of cash monthly receipts come from these cash meters; does that appear anywhere in this report—prepayment meters?
A. Proportion of cash receipts?
Q. The amount of money that is received monthly or about the amount of money that is received monthly by the Gas Com-
3530 pany from these prepayment meters, does that appear in the report anywhere?
A. Exhibit A shows the proportions.
Q. What does it show with respect to that?
A. It shows the receipts of the regular meters and prepayment meters.
Q. What is the amount of the prepayment meters in any one year?
A. Take the last year, the amount from the regular meters was $339,454.28 in Des Moines; from the prepayment meters the revenue was $204,330.
Q. It doesn't show it by the month?
A. No.
Q. Is there any place in the report it is shown by the month?
A. No, sir not in the report.
Q. But it is shown by years?
A. Yes.

Q. Do you have any memoranda in which it is shown by the month?

A. Yes, I think I have.

Q. You may look that up for me too. In going through the books and records of the Company, did you find any evidences of any special privileges to the consumers here in Des Moines in the way of putting in mains or in any other way?

A. Nothing which I would call in the nature of special privileges.

Q. Did you find anything that indicated mains were put in and money deposited by the consumers for the payment of mains?

A. Yes, sir; certain portion of the mains put in the company received deposits in advance.

Q. Did you find anything that indicated the Gas Company put in gas extensions for real estate men under some special arrangement?

A. No, I did not.

Q. You don't remember such?

3531 THE MASTER: Were those mains or services you refer to where the money was deposited?

A. I understand they are mains; that is my understanding.

Q. Now, Mr. Sangster, do you remember when this report that has been exhibited in this case, Exhibit 30, was first handed to counsel and the officers of the Des Moines Gas Company?

A. I don't know.

Q. About when?

A. There were copies made which I handed to Mr. Curran just before Mr. Hall went on the stand.

Q. You handed those to Mr. Curran just before Mr. Hall went on the stand?

A. Yes.

Q. Has Mr. Curran, Mr. Douthirt, or any of the officers interviewed you since then to call your attention to any errors in your tabulation or tables or accounts you have shown them?

A. No, sir.

Cross-examination by N. T. GUERNSEY, Esq.:

Q. These extra copies were made under arrangement with the City by which as a matter of convenience they could be made by your office and then turned over to the Company, or the complainant here when the report was produced as testimony?

A. Yes, sir.

Q. Now have you seen all the exhibits that have been introduced by the complainant in this case?

A. Yes.

Q. Have you checked them over to find errors in them?

A. Well, I don't know that; I did check them over; I don't know that you would call them errors.

3532 Q. Did you call the attention of Mr. Curran or anyone on our side of the case to any discrepancy that you found in them?

A. No, sir.

Q. You did not consider yourself under the remotest obligation to do it, did you?
A. I did not.
Q. What is your age, Mr. Sangster?
A. Thirty.
Q. How many Gas Companies have you examined?
A. None previous to this.
Q. How many public utilities have you examined prior to this one; I mean by that corporations engaged in furnishing service to the public, like gas companies, water companies, street railways, telephone companies and electric light companies?
A. Well, if you call the electric traction companies and tram-way companies, not directly under the control of the municipality, but whose maximum fares were fixed by the municipality, I have made such investigation.
Q. What companies were they?
A. Companies in Scotland.
Q. How many have you examined in this country?
A. None.
Q. Now, as I understand your statement, the scope of your work which included balance sheets of the Capital City Gas Light Company of July 1, 1886, and January 1, 1895, and February 28, 1906; is that right?
A. That is right.
Q. Then the balance sheets of the Des Moines Gas Company, March 1, 1906, and then February 21, 1907, 1908, 1909, and December 31, 1910?
3533 A. And 1909; there was a ten month period from February 1909 to December 31, 1909.
Q. Then you made up this five year profit and loss account?
A. Yes, sir.
Q. Or went over it?
A. Yes, sir.
Q. And you analyzed the additions since January 1, 1895, and you said vouched them where they were made by the Des Moines Gas Company?
A. Yes.
Q. By that you mean you checked them by the vouchers as to the latter company?
A. Yes, sir.
Q. Where did you do this work in Des Moines?
A. In the Gas Company's office.
Q. The Gas Company furnished you a room?
A. It did.
Q. Outside of the regular office?
A. Yes, outside of the regular office.
Q. But the Gas Company furnished you the room?
A. It did.
Q. The Gas Company also furnished you the books and the vouchers?
A. Yes, sir.

Q. It also furnished you some one to tell you where these entries were and that sort of thing, where the vouchers were, to help you to find the things?

A. Yes, sir.

Q. The Gas Company also furnished you an itemized statement of the profit and loss account for the five years?

3534 A. Well, yes, they did.

Q. Is this paper, marked Exhibit 24, a copy or reproduction of the statement that was furnished you by the Gas Company to aid you in your work of checking there?

A. Well, it seems to be; I couldn't say until I compared the two.

Q. I do not ask you to vouch for the accuracy of the figures, but it is apparently the same thing?

A. It is made up on the same lines, yes.

Q. And that was furnished you by Mr. Curran voluntarily?

A. Voluntarily, yes.

Q. And it was stated by him at the time, wasn't it, that he furnished it because it might aid you in checking these things out?

A. Yes, sir.

Q. And it was of some assistance to you in getting at things and checking and comparing your statement with the statement of the Gas Company?

A. Not very much.

Q. Not any?

A. I had to make up my statement, which was taken from the books.

Q. This copy or exhibit was a convenience to you, wasn't it?

A. Yes, it might have been.

Q. It was as a matter of fact, wasn't it?

A. I did not compare the statement Mr. Curran gave me from the books, I made up my own statement.

Q. I ask you whether this statement Mr. Curran gave you was not of convenience to you in doing your work?

A. It may have been of some slight assistance.

Q. You found, didn't you, so far as the books went, Mr. Curran's statement was correct?

A. Absolutely.

3535 Q. The only difference you made was on account of adjustments which you made of various items?

A. Exactly.

Q. For how long a period did the Gas Company furnish you an office?

A. About five weeks.

Q. And for how long a period did it furnish somebody to aid you in making your investigation?

A. The same period.

Q. It also furnished you incidentals, that is, furnished you paper to work with, from which you could make your statements and things like that, didn't it?

A. I did run short of paper one time and Mr. Curran very ac-

commodatingly gave me a small supply, but I did not depend on the Gas Company for paper.

Q. How much of Exhibit 30 did you write?

A. You mean the body of the report?

Q. The whole thing?

A. I constructed the exhibits and schedules.

Q. They are all your work?

A. Yes. So is the chart. I wrote pages 2 and 4 which Mr. Hall revised; that is all.

Q. That is the historical matter?

A. Yes.

Q. Now, then, you said on your direct examination that you made a complete written memoranda of this investigation or audit—which was this, an investigation or audit you made?

A. An investigation.

Q. That you made a complete written memoranda that was all contained in Mr. Hall's report; that isn't true is it?

A. No; summaries of this memoranda are contained in
3536 the report.

Q. Have you these memoranda here?

A. Yes, I have.

Q. Now, it would not be correct to say that Mr. Hall's report contains everything; it is simply conclusions that are deduced from those things that you reported?

A. Yes, sir; they could not possibly contain all the memoranda.

Q. I understood you to say that it did?

A. I had in mind just what was intended by the question.

Q. We can't tell what you mean except by what you say.

A. Well I thought it was fairly obvious.

Q. Whenever you say in your examination that the report shows what the books show, that is always subject to the exception that grows out of your adjustments?

A. Yes, I think I maintained that.

Q. And of course the books do not show your investment balance you start with on January 1, 1895, the investment entry there?

A. No, they don't.

Q. Now, you were asked whether you found a continuous account with the United Gas Improvement Company. You said you did; why was not that referred to in the report Exhibit 30?

A. I do not think that I am responsible for the treatment of the report.

Q. Didn't you help make it?

A. Yes, sir; except where I have stated——

Q. What were you doing with Mr. Hall here Saturday, Sunday and Monday down at Colfax, just before he went on the stand? Weren't you working over this report?

A. No, sir.

Q. Doing nothing?

A. I wasn't working on the report; I was doing other
3537 matters.

Q. Working on something in connection with this case?

A. Yes, sir.

Q. What matters were you working on?

A. Preparing certain statements that had to do with complainant's Exhibit 26.

Q. Making up this Exhibit 23?

A. Not exactly making it up; preparing for Mr. Hall's information certain statements; he may not have produced them, but for his information.

Q. Did any of your adjustments have to do with this account with the United Gas Improvement Company?

A. No, sir.

Q. So far as you were concerned you found that to be right?

A. That account?

Q. Yes.

A. Yes.

Q. Anything abnormal or suspicious about it?

A. Anything abnormal or suspicious about it was referred to in the report and such as was brought into prominence by Mr. Hall.

Q. Whereabouts in the report is this account referred to?

A. No where.

Q. Was there anything abnormal or unusual about this account?

A. Well, these replacement values, a great portion of the sums charged against replacement values was credited up to the United Gas Improvement Company.

Q. That is something you threw out?

A. Yes.

Q. Did you throw that out when you made your report?

A. Oh, no; it was on my statements; I didn't throw it out.

Q. Have you got your original memorandum making up
3538 your operating cost for the year 1910?

A. Yes, sir.

Q. Let me see it, will you?

A. I haven't got it here.

Q. Will you produce it so that we can look at it?

A. Yes.

Q. When you made up that account, did you exclude this item of $5,900 and some odd dollars on account of replacement valuations?

A. Possibly I may, but I did under direction, if I did so.

Q. Do you remember whether you did or didn't?

A. I really don't remember whether the statement excluded it or included it.

Q. Under whose direction did you do it?

A. Mr. Hall's.

Q. Did Mr. Hall know about the item before you made up the account?

A. Yes, sir.

Q. How could he know about it?

A. Mr. Curran produced the statement you previously referred to as we started out on our preliminary survey of our account; that item was stated separately and easily noticed.

Q. It was not concealed?

A. Mr. Hall's instructions was to make up that item, excluding that item.

Q. Did you have any conference with Professor Marks while you were making up these statements?

A. Professor Marks did ask me a few questions.

Q. Did you have any conference with Professor Bemis while making up the statement?

A. Yes, he also asked me some questions.

Q. Did they stop with asking questions?

3539 A. I took no instructions from either.

Q. Did they make suggestions?

A. None whatever; I would not have accepted them.

Q. I simply asked you whether they made them?

A. No, none.

Q. Did you give Professor Marks his statements of operating costs and the statements throwing out these accident and damage items that he has in his report?

A. I dont know what he has in his report; I showed him what I had ascertained as the result of my examination. I told him this was subject to Mr. Hall's approval. I do not know what use he made of it.

Q. And Professor Marks had access to your figures as you were making up your report?

A. In that particular instance he had.

Q. Well, he had in any other instance, didn't he; didn't he come over there and complain because you were not getting the matter of figures and information as promptly as he wanted it?

A. He didn't make any complaint.

Q. Are you sure?

A. As far as I recall, I never heard him complain.

Q. Don't you remember of his coming over there after information?

A. He was not complaining.

Q. Don't you remember his coming over there after information?

A. Yes, I do.

Q. Don't you remember of his coming over several times after information?

A. I think he came over twice.

Q. Don't you remember of his being impatient on account of the delay?

A. I don't know that he was impatient on account of any delay.

3540 Q. What was the cause of his impatience?

A. He wanted to see Mr. Hall, I think.

Q. He wanted to see Mr. Hall?

A. Yes.

Q. And Professor Bemis was also taking an interest in the investigation, wasn't he?

A. Naturally.

Q. And how frequently was he over there?

A. Once.

Q. Only once?
A. Yes.
Q. The other times you saw him at the hotel?
A. Yes.
Q. Now, do you remember defendants Exhibit 35, which showed the total book coost of the Capital City plant, plus the Des Moines Company expenditure $1,994,714.09?
A. Yes, I remember it.
Q. Did you also make that up for Mr. Hall?
A. Yes, sir.
Q. And the facts shown by that exhibit are the facts as they appear on the books?
A. I prepared them from my own statements as taken from the books.
Q. So that the report Exhibit 30 which shows the total cost seventeen hundred and some odd thousand dollars, and Exhibit 35 showing nineteen hundred and some odd thousand dollars are both made up by you from the books?
A. That seventeen hundred thousand dollars is based on the valuation of Mr. Pratt in 1895.
Q. Yes, and leaves out a few items?
A. Yes. This Exhibit 35 was made out by me from state-
3541 ments taken from the books without any introductory figures such as the valuations by Mr. Pratt, but starting off with the balances on the books.
Q. In other words it won't do to say that Exhibit 30 shows the facts shown on the books?
A. It is always understood as based on that valuation.
Q. It is always understood it shows those facts except as they have been modified by you?
A. I have been acting under instructions all the time.
Q. Certainly; I am not questioning your instructions. I am discussing simply your general statement that Exhibit 30 shows things as they appear by the books, that is true?
A. Subject to the acceptance of that appraisal as a starting point.
Q. Then you have to say subject to about $40,000 bond discount too?
A. Yes.
Q. And then subject to your deducting $250,000 depreciation?
A. $164,000.
Q. No, you didn't deduct that, you deducted six cents per thousand feet?
A. I didn't deduct that depreciat-oj.
Q. You did testify this morning that the things shown in Exhibit 30 were as they appeared on the books of the company?
A. I think I testified that the exhibits and schedules on which that report was based was taken from the books.
Q. Now, then, just what is there in this report, Exhibit 30, that shows what the books of the company show without change or modification?
A. On page 22 of the report there is a statement which shows the

present book value of the property $3,853,975.22; add depreciation written off June 30, 1909, $264,108.78.

3542 Q. Can't you indicate this without reading it all. How much is there here that is as shown by the books; just indicate it without reading it; that is simply to save time.

A. This figure, $4,118,084, is stated as the book cost of the Des Moines Company.

Q. Is that figure on the books?

A. No, the first figure is $3,853,975.22.

Q. What else is there in this report that is as shown by the books of the Company without some modification or change?

A. I think these various schedules show just what the books show.

Q. Take the first one, quantity of gas maunfactured and sold and so on, what books will show that, or did you get that from the statement made by the company?

A. The quantity sold and used by the company is shown in the journals.

Q. Did you get this from the books or the statement the Company made up?

A. From the books.

Q. That is shown by the journals of the Company?

A. Yes.

Q. Now then this next statement is made up from the books?

A. Yes, altogether; of course I put in the amounts unaccounted for. Schedule 3 showing the summary of extensions and improvements of works is as taken from the books.

Q. No change in that? Is that right, schedule 3?

A. Yes, schedule 3.

Q. Schedule 4 is not shown by the books?

A. No that is taken from certain statistics furnished to us.

Q. By the company?

A. Well that was from the books or statements handed to us.

3543 Q. And which was it, you said either from the books or statements handed to you, which did you take?

A. The particulars as regards meters were taken from the meter record, the book recording the number of meters in service or use; the feet of mains was taken from statements given to us by the Company; the gas sales were taken from the books.

Q. Does that check with your other gas sales statement balance?

A. Well, these are for the calendar year.

Q. It ought to balance out with this other statement, ought it not?

A. Yes, approximately.

Q. Well, will it exactly?

A. I don't know that it will exactly.

Q. It will if you got both of them from the same source, don't it?

A. It ought to.

Q. The fact is you did not get them both from the same source; you took this from the statement furnished by the Company?

A. No, sir.

Q. Then it will balance out with the other?

A. It ought to.

Q. But will it as a matter of fact; you know if you checked all these things?

A. Yes, sir; I remember just inquiring as to this particular item, in total this figure given for the calendar year checked up with the statement as broken up over the five year period, and I was told by my assistants they did.

Q. You didn't want us to catch you on a thing like that?

Mr. BYERS: You wouldn't want to try to.

Mr. GUERNSEY: I wouldn't regard it as material.

Q. Now, then, your summary of additions to mains, service, meters, etc., did you make that up from the book?

3544 A. Yes.

Q. From the books as they stand?

A. Yes.

Q. And did you make up this list of standard prices, schedule 6?

A. No, it was prepared by my assistants at Mr. Hall's instructions.

Q. Did you have anything to do with it one way or the other?

A. I did not directly.

Q. Then you don't know why they always took the lowest?

A. Yes, Mr. Hall instructed the assistants to take the lowest invoice price.

Q. Not the average?

A. No question of average was made.

Q. Did you take the lowest invoice price—here is a piece of 24 inch pipe, October 1907?

A. Yes, we couldn't find any invoice for 24 inch pipe until away back in 1907.

Q. So you carried three or four years?

A. In stores.

Q. Did you add interest on it?

A. Oh, no.

Q. Somebody had to pay that?

A. We are talking of invoice prices here.

Q. Did you add that interest anywhere to get at any of your costs?

A. No, sir.

Q. Somebody had to pay it didn't he?

A. Well the Company didn't take credit for it in their inventory.

Q. I didn't ask you that.

A. I should think if they thought it was worth the addition of interest——

Q. My question is somebody had to pay it?

3545 A. Yes.

Q. It was a part of that cost wasn't it?

A. This pipe was bought in 1907 and it was not required until 1910; if then they chose to pay interest on it, it is another matter,

Q. Do you know whether they bought then because it was low?
A. Very likely they did.
Q. You have to take into account the carrying charge as well as the low price?
A. Yes.
Q. You just took the low price and eliminated the carrying charge?
A. Yes, that is what is stated there.
Q. What else is there in this report that was taken from the books that is not changed?
A. The balance sheets taken from the books, Exhibit F, with the exception——
Q. No, but things that are not changed; I want things that are not changed; you testified this morning this report showed the books just as they stood?

Mr. BYERS: That is not fair; he did not say that.
Mr. GUERNSEY: I have not attempted to quote him; I will take the record for it.

Q. I wish you would point out things not changed in addition to what you have pointed out?
A. Exhibit C is a statement from the books.
Q. That is not changed in any respect?
A. Some slight adjustment had to be made.
Q. You don't understand my question; I want to know the things in this report, in addition to those you pointed out taken from the books, without change, is there anything?
A. Will you let me explain in regard to Exhibit C?
3546 Q. I prefer to have you answer my question. I am not concerned now with the magnitude of the changes. I mean what is in this report except what you have taken from the books without change?
A. That is all.
Q. You pointed out everything?
A. Yes, sir.

At this time an adjournment was taken until 1:30 p. m.

3547 1:30 p. m. MONDAY, *September* 18, 1911.

ANDREW SANGSTER being continued on cross examination by N. T. Guernsey, Esq., testified as follows:

Q. Did you bring over with you your memorandum showing the 1910 operating?
A. Yes, I did.
Q. This memorandum that you hand me is not the memorandum as you made it up originally is it. This is the operating expense 1910 this is marked Exhibit "D"?
A. This is the only statement I prepared in connection with these operating expenses.

Q. This is the final statement as it appears in the report Exhibit 30?

A. Yes, sir.

Q. Now then is that the only statement that you prepared as to this operating?

A. Yes, sir.

Q. Didn't you go through the books first and make up your statement of operating and then take it up with Mr. Hall and make your changes before Exhibit "D" was prepared?

A. I had my instructions as to what to include and as to what to exclude before I made up the statement.

Q. Before you made up any statement?

A. Before making up any statement.

Q. These instructions were given you by Mr. Hall after you had taken this statement of Mr. Curten's and looked it over?

A. Yes, sir.

Q. You said you had a reconciliation of these things here. Ordinarily in a report where you make any changes in the books
3548 you indicate the changes, what those changes are and reconcile them in the report so that a person who reads it can tell just what has been done?

A. Yes, that is usual.

Q. So you do not say for instance if you are making a report ordinarily you do not say the operating expense with certain corrections are so and so, but you say they are shown on the books so and so and then you say there are certain items which we think perhaps should be added or ought to be taken away and you indicate these items?

A. Yes.

Q. And that makes it clear so that a person to whom the report is made can tell just what you are doing and why you are doing it.

A. Yes, sir.

Q. Now the report itself does not contain this reconciliation does it?

A. I think it mentioned these specific sums in the report, in the body of the report.

Q. I know, but don't give the items?

A. Does not give a succinct reconciliation in that form.

Q. It gives the totals somewhere of the books I think, can you refer me to the report?

A. Page 11, Mr. Hall indicates what eliminations he has made.

Q. I know, but are the amounts stated in there?

A. No, the amounts are not stated.

Q. Well will you prepare for us in such shape that I can use it here a copy of this reconciliation?

A. Yes, sir.

Q. So that we may put that in and have a record showing
3549 your own reconciliation of these items?

A. Yes, sir.

Q. That will cover the five year period?

A. The whole five year period.

Q. Your attention was called to Valley Junction. The Valley Junction accounts are separated are they not on the books as far as that can be done without resorting to some method of averaging and deducting on that basis?

A. I should say so.

Q. That is in the first place receipts are shown separately, Valley Junction and Des Moines?

A. Yes.

Q. When you come to some of these expenses like say the cost of the gas in the holder it would not be possible would it to separate these matters item by item except upon some basis that was adopted as a fair basis in view of the circumstances?

A. That is so.

Q. And that could be done at any time just as easily and perhaps better later than when the gas was being made couldn't it?

A. Yes.

Q. So that the books are kept properly as far as that matter is concerned are they not?

A. Well with the possible exception of debits to the construction account I don't know, but it would not be possible to just state explicitly what proportions of the additions to plant were in connection with Valley Junction.

Q. I was talking about the operating expense?

A. As regards operating expense I don't say that it could be possible than to do more than what the books show.

Q. Then when it comes to dividing these operating ex-
3550 penses we either have got to take the revenue or feet of gas sold or some other equitable basis for the division.

A. Exactly.

Q. Now then with reference to the construction you don't know yet do you whether the books show that so that it is easily divisible or not?

A. Yes, I know that the books do not show the division between Valley Junction and Des Moines.

Q. The books do show where each extension is made do they not, if there is an extension?

A. No, sir; I don't think so.

Q. You have in this report somewhere here a schedule showing the extensions of *names* haven't you?

A. Five.

Q. Schedule 5. You begin here in 1895 and you have a certain amount. Now don't the record show where that money was spent?

A. That expenditure is analyzed according to the size of the main. That is, the accounts are kept for two inch, three inch, four inch, six inch and so on.

Q. If yo8 go back of that to the authorizations and to the other record you find out just where the work was done do you not?

A. The authorizations may show.

Q. Well do they not show as a matter of fact just where each piece of work was done and the extent of it?

A. I don't know.

Q. You don't know, well then your criticism is——

Mr. BYERS: I have asked him to get that.

Q. Your criticism is directed not to the fact this record is not kept but as to the place where it is kept?

A. Yes, sir.

3551 Q. Your notion is it would make a material difference whether kept in one place or another as long as there was a systematic record kept?

A. No, I don't say so.

Q. You have not gone far enough with your examination yet to be able to tell us whether there was a systematic — kept with reference to these transactions have you?

A. I have not.

Q. So it would not do to say the records were incomplete in that respect yet would it?

A. No, it would not.

Q. Your attention was called to the fact that *that* the special city tax was paid upon the entire earnings, gross earnings of the company, including earnings from Valley Junction, you recall that do you not?

A. Recall the question.

Q. Now did you allow that special tax upon the gross earnings as a proper operating charge?

A. Yes, I did.

Q. Did Mr. Hall allow it as a proper operating charge in his report?

A. I think he did.

Q. You are sure, aren't you?

A. Yes, I am sure.

Q. So that in the judgment of yourself and Mr. Hall it was a proper operating charge?

A. I have never passed any judgment on it. Under Mr. Hall's judgment it must have been a proper charge.

Q. Now you know do you not that the ordinance fixing these rates prescribes two per cent on the gross earnings.

A. Yes.

3552 Q. And it was a strict compliance with that ordinance that made this two per cent payment was it not?

A. Yes.

Q. Doesn't the company keep a record of every meter?

A. Yes.

Q. Shows the date when set?

A. Yes.

Q. Where it is set?

A. I could not say as to that.

Q. Have you examined these meter records?

A. I had an assistant examine it.

Q. Got to go down one step further to find out about that or up one step further, just as you please?

A. Well the purpose of investigation of that——

Q. I am not criticising it, I just want to get at the fact, I understood you to say that there was not anything in the book, on your direct examination here, to show where the meters go.

A. Not on the books of account.

Q. Would you expect that on the books of account?

A. No.

Q. Now is there something in the proper records to show just where each meter is set, when it is set, there and when it is removed and where it goes?

A. Yes.

Q. And have you examined these records so you know whether there is or is not?

A. I think the meter record gives those particulars.

Q. So that if I did undderstand you as saying that the books did not show where or did not indicate where the meters go that is an error isn't it?

3553 A. If you include the meter record as one of the books of the company.

Q. If I asked you that question you would understand it as referring to the proper books, books in which that information would properly appear wouldn't you?

A. Well on reflection I would.

Q. Just if I should ask you whether there was any original entry for instance about something you would not merely limit your answer to the ledger and say no would you?

A. Not on due consideration.

Q. Now take these tables for 1904 and 1905, what are they?

A. To which do you refer?

A. You testified you prepared something for Prof. Bemis for the years 1904 and 1905, just what kind of tables are they?

A. I prepared a statement of the operating expenses as shown by the books without any adjustment.

Q. Now did you put back into this operating expense this personal injury item that you took out later?

A. No, sir.

Q. So you left us up in the air so far as that item is concerned finally?

A. Without any intention of doing so, but that is the fact.

Q. I don't want to have you infer any criticism of it, I am getting at the situation?

A. That is the situation.

Q. These statements you prepared for these years show exactly as they appear from the books?

A. Exactly.

Q. No modifications or adjustments?

A. None.

3554 Q. Are they statements in detail or simply aggregates?

A. In detail.

Q. I want to get the extent of your conversation with Mr. Curren about this 120,000 item. Can you tell just what that conversation was?

A. I will try to recall it in general terms. When I came across the gap as it were, between the Capital City Gas Light Company accounts and the Des Moines Gas Company accounts I found of

course a considerable increase in the value of the plant stated in each of these books and I asked——

Q. You mean increase in the book value?

A. In the book value, and I asked Mr. Curren if there were any detailed inventory of the properties sold by the Capital City Gas Light Company to the Des Moines Co. He said there was nothing further than what appeared in the minute book, but he indicated that there were certain contracts which did not appear on the books including this holder, some real estate I think and there might be an oil tank, but I am not sure now. That was practically how the matter stood then and I never was able to follow it up in any greater detail.

Q. Is that the entire conversation as accurately as you can state it now?

A. Yes, as I can recall it it is.

Q. You would have to add to it this wouldn't you that Mr. Curren told you that he had given you all the information that he had about it?

A. Yes.

Q. Now did you ever take that up with him again?

A. Yes, I believe I did.

Q. And what occurred this second time?

3555 A. Mr. Curren indicated to me that *je* thought——

Q. I don't like your saying he indicated to you, can't you tell us about what he said instead of his inferences from it?

A. He intimated that certain specifications would be got showing the cost of the holders and the other items of which I never had any definite information, but up to the time when Mr. Hall prepared his report we never received these specifications.

Q. Now is that the whole story as to the holder?

A. That is the whole story.

Q. And so you took Prof. Marks' estimate of its value?

A. No—I don't know what was in Mr. Hall's mind when he stated the $120,000 as the price of the holder, all I could infer was that the balance of the bond issue namely, $120,000 must have gone for the holder.

COURT: The balance of $120,000, what was the other $120,000 for?

A. That was paid the United Gas Improvement Company for a debt of $105,000 and some odd dollars.

Q. What information did you furnish Prof. Marks as to what the books showed about the cost of this property?

A. I didn't furnish him any information.

Q. None whatever?

A. No.

Q. Nothing along that line.

A. He did compare his totals with mine, that was all.

Q. And his totals on what?

A. Additions to plant.

Q. He don't show additions to plant in his report does he?

A. I don't know.

Q. It is total on investment isn't it?

A. Yes.

3556 Q. Now didn't he go a little farther than that, than the mere comparison of the totals of the investment?

A. No.

Q. I don't recall the details of it very well, but my recollection is that Prof. Marks' figures *some* some appreciation on real estate. Did you give him a basis for making these figures?

A. No, sir.

Q. You said that Mr. Curren in connection with the holder spoke of some oil tanks. Did you ever put them in?

A. Into our figures?

Q. Yes.

A. We put nothing but the $120,000 in.

Q. You said he also spoke of some real estate, you didn't put that in?

A. I say we put nothing in but $120,000, I don't know what it is for.

Q. Have you ever checked your total real estate investment as shown by this report, that is the real estate that it covers with the real estate that the company now owns?

A. Well all the price I got as to real estate was from the books

Q. (Question read.)

A. I don't know what real estate the company now owns.

Q. You were here this morning weren't you when this plat was being used with Mr. Pease? And when they were referring to the various pieces of real estate that are used in connection with the manufacturing plant?

A. I was here.

Q. Now then I want to know whether you have checked with this plat or with some list of the real estate used in connection with the manufacturing plant the list of real estate that is included in the real estate investment which you take into account?

3557 A. No, sir.

Q. So that you don't know whether you have included all of it or not?

A. I do not.

Q. You said that this report is a complete and accurate abstract of all entries showing investment in the property of the Des Moines Gas Co. That of course is too broad isn't it? All you assume to show is some of the totals with certain variations, that is right isn't it?

A. With the reconciliation shown in the report.

Q. You don't attempt to abstract all entries that relate to these matters in this report do you?

A. I have an analysis of all figures that appear in the report.

Q. You have an analysis of the totals.

A. Yes.

Q. But the report does not purport to show an abstract of all of the entries in the accounts relating to the investment in the property does it?

Mr. BYERS: That is perfectly evident, not a matter of testimony.

Mr. GUERNSEY: The witness testified in answer to your questions on that very subject this morning that it was.

Q. Does this Exhibit 30 contain a complete and accurate transcript of all entries showin- investment in the property that is now owned by the Des Moines Gas Co.?

A. No, sir.

Q. Now does it contain a complete and accurate abstract of all entries as to costs of distribution of gas?

A. Subject to this reconciliation that I shall give you it will show all these entries.

Q. It does not show the entries does it, simply shows the totals.

3558 A. The totals, yes.

Q. A big difference between the entries and totals.

A. Well I understood you to mean——

Q. Not to mean what I said, is that right?

A. Yes.

Q. Assuming I meant what I said it is not an accurate abstract of all of thes- entries, but simply shows the totals?

A. Shows the totals.

Q. With certain changes, that is right isn't it?

A. Yes.

Q. Now you said you found a reference to certain mains where the company received a deposit in advance.

A. Yes.

Q. The balance of these deposits was less than $2,000?

A. Yes.

Q. And those were cases where in order to induce the making of the extension the property owner had put up some money to be returned as sales of gas paid for the extension?

A. That is as I understand it.

Q. The special privilege that these people had was that they paid to get the mains where the public generally didn't *it?*

A. That is so.

Q. On page 58 of his report Mr. Marks says the total cost of street mains from the beginning of the first gas company appears to be recorded in these books as $647,290.35. Is that something for which he asked you and which you gave him?

A. Well I say that he compared his totals with me.

Q. But that don't answer my question, is that something for which he asked you and which you gave him?

A. I don't remember Mr. Guernsey.

3559 Q. Will you say it was not?

A. I could not say one way nor the other.

Q. When you say he compared his totals what do you mean by totals?

A. Results which he arrived at.

Q. You don't mean his final result, that is his fourteen or fifteen hundred thousand dollars do you?

A. Investment in the plant?

Q. Yes.

A. No.

Q. What do you mean then by totals?

A. As regards his total estimate of the investment in mains services and differenc branches of the plant.

Q. You mean the various items that go to make up his total?

A. Yes.

Q. On page 59 of his report referring to services he said the total structural cost of services from the company's books appears to be $257,672.56 from the beginning. Did you give him that too?

A. From the beginning?

Q. I will quote that over again, the total structural cost of services from the company's books appears to be $257,672.56 from the beginning. Did you give him these figures also or something like that?

A. I don't recall.

Q. Well did you take up with him the matter of the cost of services as shown by the books?

A. I don't recall.

Q. Will you say you didn't?

A. No, I won't say I didn't.

Q. Did you tell him when you gave him these costs that
3560 they did not include any interest during construction or taxes during construction or overhead charges?

A. No.

Q. You knew they didn't include them didn't you?

A. Yes, I know that.

Q. Now taking up the matter of meters I find on page 61 of Mr. Marcks' report at the end of meters this statement, the total charged to meters on the books of the Des Moines Gas Company is $187,755.93,, from the beginning. Did you give Prof. Marks that information?

A. I really don't recall what I gave Mr. Marks.

Q. Well don't you remember this that when Prof. Marks was preparing his report here he called on you for information. You remember that much don't you?

A. He didn't come to me for information personally.

Q. Did you have any talk with him personally?

A. No, sir.

Q. None whatever?

A. Mr. Hall and he had an interview I think.

Q. Were you present?

A. No, I was not.

Q. Then of course you don't know anything about that?

A. No, sir.

Q. I wish you would turn to Exhibit 30 and find out what you ascertained to be the investment in real estate?

A. Page 21 states the investment in real estate as $35,765.26.

Q. Let me call your attention to this at page 77 of Prof. Marks' report, you will note that the structural cost of the land is taken by me from the records found as $35,765 and the present value of

the land approximated at $100,000 showing an appreciation,
3561 and so forth. Now did you give Prof. Marks that figure $35,765?

A. I may have, I don't recall.

Q. Would you say you did not?

A. No.

Q. So far as you know did Prof. Marks make any examination of these books himself?

A. No he did not.

Q. Do you know of any source from which he could have obtained this information except from your examination?

A. Now I do not.

Q. Unless he had gone to us?

A. That is right.

Q. Now which one of these exhibits shows in dollars the expenditures each year for the various items of repairs?

A. Exhibit "D."

Q. Under what head in Exhibit "D" do the repairs works for the year 1907 appear, where do we get them?

A. Under manufacturing, under the head of manufacturing.

Q. Repairs works?

A. Yes.

Q. They are how much?

A. $9,699.99.

Q. Now I find that at page 79 of his report, Prof. Marks says the Des Moines Gas Co. presents the following record of repairs covering a period of four years and giving yearly averages which probably are not as accurate as might be derived at a longer period. Des Moines Gas Co., September 24, 1907, repairs works $9,599.99. That checks with your figure here doesn't it?

3562 A. Yes.

Q. Did you give Prof. Marks that information?

A. I don't remember.

Q. Will you say you did not?

A. No.

Q. Now then take the next year, what was the repairs works?

A. $6,835.23.

Q. Prof. Marks gave it for the next year $6,835.23. Do you know whether you gave him that or not?

A. I really don't recall what I gave him in any respect.

Q. You do know you gave him something?

A. I recall he compared certain figures with mine, but I did not know that he took any figures from my statements.

Q. How *he* could he get this information as to costs as shown by the books except by your investigation?

A. Oh he would get it from *h*these figures certainly, but I may not have given them myself.

Q. He was while he was making up this report or while you were doing this work, he was coming to you for information as to these costs and you were furnishing it to him and these various other matters, that is true isn't it?

A. Yes.
Q. Did you give him your figures on working capital?
A. No, sir.
Q. Must have got that from Mr. Hall?
A. No, he didn't get any figures from Mr. Hall as regards working capital because Mr. Hall's figures were not made up until Mr. Marks left.
Q. What does Mr. Hall say is the working capital?
A. Page 20 $68,952.91.
3563 Q. And Prof. Marks shows $68,689. Do you think figuring working capital on two separate methods and making it a matter of computation two men can get as close as that?

Objected to as incompetent, immaterial and wholly unfair, it must be assumed that whatever figures Marks gave I think — so stated in his testimony, with reference to what the books show he got through Mr. Hall or Mr. Sangster.

Q. Do you think that it would be possible for two people working out the working capital on entirely independent methods to get as close together as $300 or less?

Same objection.

A. Well knowing in the first place that Mr. Hall made up his figures from the balance sheet after Prof. Marks left Des Moines it does not seem to me improbable.
Q. Didn't Mr. Hall make up part of his report here in Des Moines?
A. Yes.
Q. While Prof. Marks was here?
A. Yes.
Q. And wrote part of it in Chicago afterwards. That is the fact isn't it?
A. No, sir.
Q. Wrote it all in Des Moines while Prof. Marks was here?
A. Yes, he did if you put it that way.
Q. And they were in conference while the report was being written weren't they?
A. I was not aware of the fact if they were.
Q. You were not?
A. No, sir.
Q. Now on page 83 of Prof. Marks' report there is given the cost Per M in cubic feet for manufacturing and distributing gas
3564 January 1, 1906 to December 31, 1910. Those costs were furnished by you were they not.
A. Yes, sir.
Q. And do you remember talking to Prof. Marks about that?
A. Yes, I recall giving him those figures.
Q. You also gave him the figures that are contained on page 84 of his report showing the deductions from the operating expenses amounting to $16,746.88 for the five years' period didn't you? Will

you look at your reconciliation sheet and see if that is the gross amount of your deductions before the additions, 16,746.88?

A. Yes.

Q. Now then he got that information from you?

A. Yes, he did.

Q. And this interest on bank balance $1,508.54 does that check.

A. That is right.

Q. He got these figures from you?

A. Yes.

Q. Now you had a good many conferences with him after all didn't you?

A. No, sir I have not.

Q. Did he ask for all these things at once?

A. I clearly recall when I gave him these figures as regards cost &c.

Q. Did you tell him that this accident occurred in 1893 on account of interest on the floating debt?

A. I could not have said 1893 because I knew it was not.

Q. That was an error, it was 1903?

A. 1903.

Q. Did you give him this item $7,126.53 as a deduction on account of interest on the floating debt?

3565 A. Yes, sir.

Q. Now as a matter of fact as you went along you turned over to Prof. Marks what your examination of the books disclosed didn't you? I don't mean every detail but the substance of it.

A. No, sir; I gave him these figures that was all I gave him.

Q. Somebody gave him other figures, that is somebody gave him these costs?

A. I am referring to the costs.

Q. I mean the costs of the property, not the operating costs, investment perhaps I should have said, somebody gave him these figures as well, take the real estate figure for instance, that checks with yours within twenty six cents?

A. Yes, sir.

Q. Take mains, services, meters and manufacturing plant as you got it you gave him the information on all of these things didn't you?

A. I say we compared totals, that is all.

Q. Did you reconcile them?

A. No, sir.

Q. Did you give him the figures on the sales which are set out on page 85 of the report December 31, 1905, to December 31, 1910, including the sales and the collections?

A. Yes, I think I did.

Q. Clear back on page 36, referring to relief holder No. 18. Prof. Marks says the books of the Des Moines Gas Co., it appears they have a charge of $33,356 to this holder. You gave him that information didn't you?

A. No. 2?

Q. No. 18.

A. Which holder is that?

Q. 175,000 cubic feet capacity.

3566 A. I don't know, I don't recognize it from its capacity.

Q. Do you find cost of a holder there $33,356?

A. Yes, sir.

Q. You gave that to Prof. Marks?

A. I think I gave him details of this appraisal of January 1, 1895.

Q. Is that a holder that was purchased before January 1, 1895?

A. Yes.

Q. Did you go into the books to find out what it cost?

A. I took the book figure at that date.

Q. Read the answer to the witness and see if that is what he means?

A. January 1, 1895.

Q. From what did you get that figure as to that holder on that date, what book was it, some entry of that date as to the cost of that holder?

A. If I remember right the tank and holder are stated separately, but the total amounts to this figure here.

Q. On the books?

A. On the books.

Q. How did they happen to enter that *as* on that date on the books it was not nearly all the holder was it?

A. That was the balance standing at the debit of the account to the holder.

Q. It was not an appraisement of the holder as of that date?

A. Mr. Pratt stated the same figure in his appraisal.

Q. They agreed?

A. Yes.

Q. Now then take the next holder, Mr. Marks' report on page 37 says the books of the Des Moines Gas Company appear to have charged $40,057 to this holder. You find one of the same

3567 amount?

A. I find here tank and holder No. 3 $40,057.

Q. Did you give him this information, give Prof. Marks this information?

A. I say I think I gave him the details of that appraisal.

Q. Is this what you mean by simply comparing totals?

A. Totals as at December 31, 1910.

Q. You did a little more than that didn't you?

A. Yes, now that you bring it to my mind, I remember giving him the details of this appraisal.

Q. You gave him details of the costs as far as you got them didn't you?

A. Cost as shown by the totals.

Q. Will you say it was limited to totals now?

A. I gave him these totals and details of this appraisal.

Q. Do you remember anything more you gave him?

A. The cost per thousand cubic feet of manufacturing gas for the last five years.

Q. Can you remember everything that you gave him?

A. No, sir.

Redirect examination by Hon. H. W. BYERS:

Q. I suppose it would be fair to say that whatever Mr. Marks says in his report that the books of the company show that information he got either from you or Mr. Hall or some of these other young men that were examining the books?

A. Yes, I should say so.

Q. Of course the purpose of this cross-examination is to indicate that Mr. Marks got his appraisal from the figures that you got
3568 from the books. You say you compared totals, what do you have to say as to whether Mr. Marks made up his valuation from your information or Mr. Hall's as to the valuation of this physical property?

A. Well that is what I mean when his appraisal was prepared he compared the total of the appraisal with figures which we had arrived at.

Q. After he had worked out his valuation of the plant?

A. Exactly.

Q. First he figured it, then he compared the total valuation as he found it with this book investment as you found it.

A. Yes.

Q. That is what you mean by compared totals.

A. That is what I mean.

Q. It is not true is — that Mr. Marks in any respect made up his figures as to valuation of this plant from figures you furnished for any such purpose?

Mr. GUERNSEY: I think counsel has forgotten about leading questions again?

A. No, sir; it is not.

Q. You were asked to state whether or not you know that the real estate as it appears on the books checks with the real estate the company now owns. Did the company furnish you any information about any other real estate except what appeared on the books?

A. None whatever.

Q. So you have no means of knowing, so far as you now know as to what real estate they owned, except what appeared on the books?

A. Nothing but what appeared on the books.

Q. Now the Valley Junction matter, you were mistaken in the statement which you made which as I remember it was that
3569 there would be no way that the books could show the cost of extensions and improvements at Valley Junction. It would not be difficult at all would it to keep an account with Valley Junction showing the money expended there in extensions and improvements and additions?

A. I don't think it would.

Q. There is no such account?

A. No, sir.

Q. Now as I understand the Valley Junction end of this concern the only thing that the books do show in the way of separate and independent accounts is the gas sold, total of gas sold and the revenue?

A. Yes, sir.

Q. And if I understand your testimony in order to assertain so that the Master in the final decision, if he wanted to use it, the credits that are on the books of the company, what was involved in construction and improvements and additions at Valley Junction, it would be necessary to trace or take these authorizations that come from Philadelphia.

A. Yes.

Q. Then you might not be able to do it unless the authorization itself showed exactly where the improvement was to be made and the cost of it separate from the cost of any improvement in Des Moines?

A. Yes, it would be necessary to go to the authorization or some document.

Q. Now it would be no trouble at all would it to show on the books exactly what money was expended in Valley Junction for improvements and extensions and additions and then to charge a per cent of the expenses like general expenses and office expenses
3570 and operation at Valley Junction and get at a reasonable statement, comparative statement as to the value of the Valley Junction plant and the Des Moines plant.

A. With some little extra trouble they could ascertain that information.

Q. In one answer you said you had your instructions as to what should be included. What did you mean by that?

A. Included in what?

Q. In your statement or in this report you made, the memoranda that I have made here is I had my instructions as to what should be included.

A. I think you refer to operating expenses. Mr. Hall made a survey of the profit and loss account as su-mitted to us when we first started out in the investigation. He ran over the items and he said—he told me which to——

Q. That is he explained to you which in his judgment were proper charges and proper expenses and which were not?

A. Yes, sir.

Q. Now what other or different items, if any, did these instructions refer to than the ones Mr. Hall has already fully explained here to the Master?

A. None whatever.

Q. Now Mr. Guernsey had you say, he put this sort of a question to you, well then why didn't you use the United Gas Improvement Company's account in the report. It is in the report isn't it?

A. It is included along with the other items, the general account.

Q. It is in the same way that all the other items are.

A. Same as any other account.

3571 Q. The $105,000, there seems to be a little confusion yet about that ~~$105,000 and the~~ $120,000 allowed for the holder. If I understand the $105,000 item it was ~~the balance~~ due as shown by the books of the Capital City Gas Light Company from ~~that Company~~ to the U. G. I. on a running account?

A. Upon running account. On an open account and on bills payable.

Q. And much the same kind of an open account as has been carried with the U. G. I. by the Des Moines Gas Company since 1906?

A. Yes.

Q. And that $105,000 balance was if I understand you, if I don't correct me, was paid off or canceled rather with $120,000 of that $285,000 issue of bonds.

A. That is quite correct.

Q. And it is the other $120,000 after taking out the $45,000 for Valley Junction that you stated to the Master this morning was inferred by you and Mr. Hall to represent the cost of this holder?

A. Yes.

Q. Mr. Guernsey *had* you say that Mr. Hall's report shows conclu*d*ions only. That is not exactly so is it?

A. Conclusions based upon these statements and exhibits as appended to the report.

Q. And it reports and summarizes these—the report generally report- correct summaries of the book entries with reference to the different things covered and treated by the report?

A. Yes.

Recross-examination by N. T. GUERNSEY, Esq.:

Q. That is not just right is it?

3572 Mr. BYERS: Well I think we all understand what he is trying to get at.

A. I understood by treated in the report as shown in the treatment in the report.

Q. That don't make it very lucid to me. You don't mean to modify the statement you have made so many times that this report is based on these books entries with certain modifications do you?

A. I think that is quite well understood.

Q. This $105,000 that was about $48,000 of it bills payable, $48,700?

A. I can't recall the exact amount.

Q. Something like that?

A. Yes; something about that.

Q. Balance for accounts payable?

A. Yes.

Q. For material and supplies and things like that?

A. Yes, and interest I think, credits for interest on their account.

Q. Yes, there was a little interest there, $487.00 as I recall it.

A. Something like that.

Q. Were you in conference with Mr. Marks when he was preparing his report?

A. No, sir.

Q. Did you ever see his report?

A. I didn't see it until Mr. Hall I think it was was looking over it.

Q. As it was being prepared?
A. No, sir.
Q. Afterwards?
A. Yes.
3573 Q. Then you can't tell what use Mr. Marks made of these figures can you?
A. I never said that I knew.
Q. Didn't you, you said what he didn't do with these valuations a few moments ago when General Byers asked you whether he did this that and the other with these valuations, you said no, no, didn't you say what Marks did, as to the use which Marks made of these valuations in making up his report, you remember being asked about that a few moments ago don't you?
A. I don't see he could make any use of our figures.
Q. Don't you remember being asked about that a few moments ago?
A. Yes.
Q. As a matter of fact, you don't know just what Prof. Marks did do?
A. No, I don't.
Q. You haven't any information about it whatever have you?
A. No, sir.
Q. Referring to these questions asked you on redirect examination that have just been read to you about the use that Prof. Marks made of the figures furnished to him by you, you have no information whatever as to what use he made of these figures have you?
A. Well all I can say is that I inferred from the fact that his appraisal was apparently prepared, that he was comparing his totals with ours as a matter of interest?
Q. That don't answer my question. You have no knowledge whatever have you as to the use which Prof. Marks made of the figures furnished to him?
A. Of course not.
Q. You didn't have any when you answered a few moments ago that he didn't use them.
3574 A. Well I meant to infer just what I replied in my last answer.
Q. Now then you said that a separate account could be kept on the books as to Valley Junction extension. That would not help us any way would it if we were looking to the actual value of the plant instead of the mere book value?
A. I don't suppose it would.
Q. It would only be material when you came to questions of book value and things of that kind?
A. Yes.

Witness excused.

3575 JANSEN HAINES being recalled on the part of the defendants and examined in chief by Hon. H. W. Byers, testified as follows:

Q. I find in defendant's exhibit 27 on page 120 the following record: "Agreement with real estate operators. Authorized contract with certain local real estate operators for laying street mains and services in connection with development of property. Estimated cost $5,000 of which parties benefited are to advance $2,500 same to be refunded as consumers are obtained, form of contract approved by counsel." Just what does that record refer to?

A. You wil- have to let me see the record General.

COURT: What year was that?

A. That was February 19, 1908. I don't recall what this was from this record, I think I can find it for you.

Q. Do you know who the real estate dealers were, what firm it was.

A. Well I don't recall we have made that form of contract with a number of real estate men different times, but I can find out for you and let you know. We have copies of these contracts in our office.

Q. I wish you would find out the names of the several real estate dealers as shown in the contracts you have and the amount which was involved in each of the contracts if you will?

A. All right, be glad to do that. I wil- bring in the contracts.

Q. In your books for 1907 I find the following credits, expenses charged by U. G. I. company $2,365.13. Do you know what expense that covers?

A. Let me see what you have got, I don't remember.

3576 Q. This is not the book itself, just a memorandum.

A. What is the date of it?

Q. January 1907.

A. Where did you get it from, give me some clue where I can locate it on the books. That is very vague.

Q. The next item is repairs, stores and authorizations $7,527.04. What does that refer to?

A. I can't tell from that record until you tell where I can get that and I will get the books and show it to you.

Q. Interest $453.30. Do you know what that interest was figured on?

A. I certainly can't tell you that. You can read me a list of figures off if you want to, but I can't guess what they are. You will — to give me some place where I can locate them on the books.

Q. These items are totaled and then there is an item of $44,000 cash and the deduction of the charge $9,141.14 leaving $44,635.47 as due the U. G. I., and that was closed by note was it?

A. I don't keep these books in my head, if you will show me the books I will be glad to show anything I know about it.

Q. What I want to get at is the practice more than the particular item. You carry an account right along with the U. G. I.

A. An open account?

Q. Yes.

A. Yes, material, supplies, and various things, money advanced.

Q. That account is kept is it not or rather the entries are made here from directors or instructions from the Philadelphia end?

A. The entries here are made from bills furnished or bills rendered to us just the same as if we purchased material from
3577 any other concern?

A. The bills naturally come from the U. G. I. office because that is where they originate.

Q. When there is a balance due at the end of the year, that is if you want cash, if you want to use money the U. G. I. furnishes the money and then you prepare and execute or have executed a note covering the balance of the account together with the cash, close the account that way don't you?

A. The way it has been done, if I need money for extension and improvements as I frequently do, I make a draft on the U. G. I. for five, ten, fifteen, 25 or $30,000, whatever is necessary and the officers of the company execute a note of this company in favor of the U. G. I. company.

Q. At what interest?

A. At six per cent.

Q. In that note is included whatever balance there is to their credit in this open account?

A. I should have to go to the books to tell you that?

Q. Don't you know your practice is to pay the U. G. I. interest on all balances as well as interest on notes?

A. On open accounts over thirty days or over sixty days, just the same as we would any other firm.

Q. It is figured at six per cent isn't it?

A. Yes, the same as the bank rate, the same as the bank would loan it to us at.

Q. Commercial paper in this town for the last two years has been carried as low as three and a half?

A. I never put out any commercial paper for this company on the street.

Q. I am not talking about the street.

3578 A. That is what commercial paper is, is commercial paper put on the street.

Q. What difference does it make where you get the money so you get the lowest rate, whether you get it on the street or whether you get it in the bank?

A. It makes just this difference, that the commercial paper put on the street is paper which is absolutely met at the time it becomes due and must be met. The bank will carry an open account where payments can be made on the account at their regular banking rate.

Q. That is what you did then as you call it, you dealt with the U. G. I. the same as you would a banker and paid the same rate of interest.

A. Yes, we could defer our payments, we did not have to make payments when it became due, continue to pay interest on them but if commercial paper you would have to take up the paper.

Q. Let's just take this account here of the U. G. I. for the year 1907 as it appears on the books for the year ending February 28,

1907, there is charged to manufacturing $16.08. Now what did that represent?

A. Well I would have to look at the books. I could not tell from that statement.

Q. I am reading this from the books.

A. Yes, but I would have to go back of the books.

Q. Distribution $16.08, you might not be able to tell what that is. The next item is organization expense $993.52. What is that item?

A. That is all spread in the books, I can't tell you just from that statement.

Q. What do you think it is here?

Objected to as immaterial.

3579 Q. The next is office expense $882.72. What is that item?

A. The same as the other items, I can't tell you in detail what the items are you are reading from the paper.

Q. Don't you know what would be included in such a charge as that or credit on your books?

A. I could not carry these accounts in my head, we have some seven or eight thousand accounts in o-r books for the last four or five years and how on earth could I carry these accounts in my head.

Q. You don't have several thousand accounts with the U. G. I.?

A. No.

Q. Can't you tell what the U. G. I. was likely to be credited $882.72 for, for office expenses?

A. I am not going to guess on that when the books show the fact.

Q. Next is general expense $151.62, have any idea what that is?

A. Have the same answer to that.

Q. Works expense, $182.85. Any idea what that is?

A. You wil- have to go back to the books.

Q. Whom would know about this if you don't, you could not tell any more about it from the books than you can me reading what is on the books?

A. Certain books will show the details.

Q. Where in the books will it show what this office expense of $882.72 eas, where will we find that on your books just as I have read it to you?

A. I don't know where you got that statement, tell me where you got the statement from or let me see the statement and see the books and probably find out.

Q. It runs through the whole date of your company. Take the statement and check it up with the books and tell me tomorrow if you can't do it today.

3580 COURT: You don't keep the books yourself do you?

A. No, sir.

Q. Do you pay interest on accounts like this to the U. G. I.?

A. We pay interest on our notes which we give the U. G. I., and we would on balances I suppose over sixty days, but as a matter of fa-t when we have the money we pay the balances.

Q. But if you don't have the money you pay interest, credit up interest to the account?

A. Certainly if we can't pay the account we have to pay interest on it.

Q. Interest is always figured at six per cent?

A. Yes, sir.

Q. Can you give for me the extensions and additions that have been made to the Valley Junction plant since March 1906 without too much trouble?

A. I won't acce[illegible] your second qualification, it will be a great deal of *yt*oublе to get them, but I can have them gotten for you.

Q. I wish you would have some of the boys up there do it for me in the next day or two if you will. You have found Exhibit 18 have you?

A. Yes, I will bring it in in the morning.

Q. Who was your immediate predecessor in the management of the Des Moines Gas Co.?

A. E. G. Pratt.

Q. We call him Col. Pratt?

A. Col. Pratt.

Q. Do you remember when you were on the witness stand a good while ago at the beginning of this investigation or trial I asked you if there was any change in your salary because of the change
3581 in your title?

A. I don't recall the question, but you may have asked me that.

Q. Well there was a change in the salary wasn't there?

A. There was a change in the salary on the first of this year. Do you mean that? Change in the salary when?

Q. This summer, not the first of the year?

A. No, sir.

Q. When was the change?

A. January 1, 1911.

Q. Was it made then or made in July of thiss year to be entered as of date January 1?

A. I think that the minute book will show that it was made in January or February to date back a few weeks.

Q. Did you get that increase?

A. Certainly.

Q. That is not like the salary then of the Philadelphia gentlemen?

A. I don't know about the salary of the Philadelphia officers of the company. I get my salary and spent it.

Q. You know as a matter of fact that Douthirt's salary and Pearson's and Bodine's goes to the U. G. I., not to these individuals, do you know that?

A. Yes, I know it.

Q. That is not true as to any part of yours?

A. No, sir.

Q. You were to get me the contract, furnish me the contract with Brereton for the construction of one of these brick buildings down

here, will you have a jote made of that so it will be brought in in the morning.

A. Yes.

Q. In this defendant's Exhibit 27, Des Moines Gas Com-
3582 pany No. 1 stockholders and directors meetings on page 233 is recorded the following: "Expenditures made for additions to, extensions or betterments of plants of the Des Moines Gas Company or for acquiring other plants or property real or personal from March 1, 1906, to December 31, 1910, real estate $1,649.26, extensiojs and improvements at works $85,760.39, street lamp extensions, $2,039.65, extension of street mains $242,686.12, meters $68,364.93; services $72,493.28; total $472,993.63." Is that a correct record?

A. You are reading from the book?

Q. Yes.

A. Yes, sir.

Q. Now what real estate is that that is referred to there for which an expenditure of $1,649.26 was made?

A. I don't know, I will have to look it up on the books.

Q. Will you make a note of that and look it up for me?

A. Glad to, yes.

Q. Extensions and improvements at works $85,760.39, does that include improvements, extensions and improvements both here and in Valley Junction?

A. It would if there had been any made, but as a matter of fact I don't think there has been any made since that time.

Q. This is right up to January of this year?

A. I don't think any has been made since the first of March 1906 to works account at Valley Junction.

Q. What sort of works have you got over there?

A. We have a governor station there.

Q. So it would not be so very far wrong to mention works even at Valley Junction, of course I suppose that the works since the combination of the two plants practically all are at Des Moines.
3583 There are no street lamp extensions in Valley Junction?

A. No.

Q. So that would all be here. Now there have been extensions of the street mains over there since 1906?

A. Yes.

Q. In fact about all the mains you have over there were laid since March 1906?

A. No sir; I think nearly all laid prior to that. A few extensions since then.

Q. What have been are in this item?

A. I presume they are.

Q. Meters $68,364.93, that includes meters both here and Valley Junction?

A. Yes, that would include meters both here and Valley Junction.

Q. Would the same be true as to services?

A. Yes.

Q. I don't know whether it has ever went in the record and I want to make you our witness for that purpose, just what arrange-

ment you have for supplying Valley Junction—I wish you would tell us just how you reach Valley Junction with gas or mains and services?

A. We supply Valley Junction from our Des Moines distribution system on the end of it.

Q. So that whatever of the main that serves Valley Junction beginning at the dividing line between the Junction and Des Moines and the works is included in the distribution system of the city of Des Moines?

A. Yes.

Q. Do you have anything in the way of an additional aid to the services in the way of what might be termed Boosters and
3584 *and* high pressure mains, pushers, maybe that is a better word?

A. We have a high pressure distribution system in Des Moines and the connection to Valley Junction is made off that high pressure system.

Q. And where is that connection made?

A. Right at the line of Valley Junction.

Q. I understood Mr. Maul to say that the main served Valley Junction only served about a half dozen or dozen persons out in the west end of town and I wondered if that was correct?

A. That is not correct in quantity. The same main that serves Valley Junction serves 51st street and serves my recollection is, about 70 or 75 customers along the line.

Q. West of 51st street?

A. Some west and some east of 51st.

Q. How far east?

COURT: 63d street is the line?

A. Sixty third street would be, I think it is. It is called First street in Valley Junction. We supply high pressure service as far back as 44th street and one or two services this side of it, but I don't remember exactly where they are.

Q. When was the high pressure service put in?

A. The high pressure serivce was put in about the same time the Valley Junction system was put in.

Q. Was put in on account of the Valley Junction system?

A. Yes, put in because our supply was not adequate at that time to supply Valley Junction without high pressure.

Q. I don't know what pusher means in connection with gas, it was suggested I used a wrong term when I said booster. What are pushers?

A. Pushers are simply gas pumps at the works which are
3585 used to maintain a higher pressure on this line because of the fact that it supplies over the hill between what would be 46th street and 56th street.

Q. Forty-sixth street would be along about——

A. About Polk Boulevard.

Q. About the Park there, Greenwood park?

A. Greenwood park.

Q. Greenwood Park is higher than it is this side?

A. Greenwood Park is right where Ingersoll Park is on west Grand Avenue between 45th street and about 47th or 48th street the south side of Grand Avenue.

COURT: Valley Junction is north of the Coon river?

A. Yes, north of the Coon river and lies directly west of Greenwood Park, the west line of Greenwood Park I think is about 47th and Valley Junction's east line would be 63d.

Q. These pushers are pumps you use in forcing gas on beyond 36th street and to Valley Junction?

A. Yes.

Q. And those are located down here at the works?

A. We run those about twenty minutes or half an hour a day, something like that.

Q. Something has been said about a special deposit and I want to see if I have the right understanding about that. That seems where a residence is beyond the end of a main and the settlement not sufficiently dense to justify the company in putting in mains, you make some arrangement with the consumer by which he deposits the costs of the main and then later on as the business develops and other people settle in the money is returned, is that the idea?

A. That is the general idea. We have a standard form of
3586 contract with the consumer by which we will lay the main and he will pay us for the wages and material used and we will refund the money which he advances to us pro rated on the length of the main on a basis of one consumer for every ninety feet.

If he wants us to run 180 feet as soon as we have two consumers on that main, on that 180 feet we refund him the whole amount of money.

Q. So he finally does get it all back?

A. He gets his money back. It is done simply at the request of some of the real estate operators who want to develop their property.

Q. Do you know who took over the last issue of bonds of the Des Moines Gas Company?

A. I do not, no sir.

Q. Do you know who holds them now?

A. I have not the faintest idea.

Q. That sale was not made from this office?

A. No, sir.

Q. Made at Philadelphia?

A. Made by the treasurer.

Q. Mr. Lilley is treasurer?

A. Yes.

Q. Both companies?

A. He is treasurer for the United Gas Improvement Company and also for the Des Moines Gas Company.

Q. Was he treasurer when you first came here?

A. Yes, I believe he was.

Q. Mr. Walton Clark was Vice president of this company.

A. The minute book will show. I don't recall what changes there have been since I came here in the officers.

3587 Q. Under date of March 1, 1906, the records show the election of the following officers: President Samuel T. Bodine; 1st vice president Randall Morgan; second vice president Walton Clark; Treasurer, Lewis Lilley; assistant treasurer, W. B. Keffer. Secretary, W. A. McEwen; assistant secretary, W. B. Keffer. Mr. Lilley and Mr. Clark still retain the same relation to the company do they?

A. Yes, Mr. Lilley is treasurer and Mr. Clark vice president.

Q. Second vice president it is stated here. Do you know what Mr. Clark's official relation is to the U. G. I.?

A. He is third vice president and general superintendent.

Q. Was Mr. Clark vice president or second vice president of the company when you first came out here?

A. No, I think Mr. Albert B. Cummins was, Governor Cummins first vice president.

Q. I find from the records Mr. Clark was not an officer at that time, that is all I wanted to know. Now you don't know then I take it who made any of the purchases of bonds of the Des Moines Gas Company?

A. No, sir.

Q. Nor who holds them now?

A. No, sir; I do not. I have no way of getting that information.

Mr. BYERS: The defendant at this time offers from defendant's Exhibit 27, the record found on page- 233 and 234 under the head of betterment statement to December 31, 1910, and certification of $60,000 in bonds which reads as follows: The president submitted a statement prepared by the treasurer showing that the company had expended in making additions to or extensions or betterments of its plants or for acquiring other plants or property real or personal March 1, 1906, to December 31, 1910 the sum of

3588 $472,993.63 and showing the various items comprising this sum which statement was read and ordered spread upon the minutes and is as follows: Expenditures made for additions to extensions or betterments of plants of the Des Moines Gas Company or for acquiring other plants or property real or personal from March 1, 1906 to December 31, 1910, real estate $1,649.26 extensions and improvement at works $85,760.39, street lamp extensions $2,039.65, extension of street mains, $242,680.12, meters $68,364.92, services $72,493.28; total $472,993.63, less amount of bonds heretofore issued on account of same $412,000. Balance of amount for which bonds may be issued at par $60,993.62. Certification of $60,000 bonds. The president thereupon stated that it was proper to request the trustee under the company's first mortgage dated March 1, 1906, to certify and deliver bonds equal to the amount of the above balance of $60,993.63. The following was then unanimously adopted, whereas, this company has expended from March 1, 1906, to December 31, 1910, the sum of $472,993.63 for additions to, or extensions or betterments of its plants or to

acquire other plants or property real or personal and whereas, the Commercial Trust Company's trustee, under this company's first mortgage dated March 1, 1906, has heretofore certified and delivered on account of the above expenditures bonds of the par value of $412,000 leaving a balance of $60,993.63 to which amount the trustee may now properly be requested to certify and deliver additional bonds. Therefore, resolved that the trustee be, and it is hereby requested to certify $60,000 at par of bonds (leaving a balance of $993.63 on account of which certification and delivery of bonds may hereafter be requested) and to deliver the same to or upon the order in writing of the president of the company to be used by the company only for the purposes of making additions to or extensions or betterments of its plants or acquiring other plants or property real or personal as above set forth. Resolved further that the secretary be directed to deliver to the trustee a certified copy of this preamble and resolution. The board then adjourned. W. F. Louthirt, Secretary. Entered and compared by S. L. E. and W. H. R.

3589

Q. Is Day street in Des Moines or is that in Valley Junction?

A. I don't recall offhand.

Q. Hartford street, does that run to Valley Junction?

A. Get the map. I find Hartford Avenue on the Valley Junction map on the Des Moines side of the line between Valley Junction and Des Moines.

Q. I take it then it runs on through Valley Junction?

A. It is called Maple street on the Valley Junction side of the line.

COURT: The line is the center of the street?

A. Cuts across the line, Maple street on the west side of the line and Hartford Avenue on the Des Moines side.

Q. Day street, where is it?

A. Day street is a little street between Laurel and School streets and between Thirteen- and Fourteenth streets in west Des Moines.

Q. I have found a record here. It was in July that you were elected president was it not?

A. Yes, sir.

Q. I find this record here contained in defendant's exhibit No. 28 under date of July 10, 1911. The resignation of Mr. Samuel Bodine as president was presented. On motion duly made and seconded Mr. Bodine's resignation was accepted. Election of Mr. Jansen Haines as president. Mr. Jansen Haines was nominated for president to fill the vacancy caused by the resignation of Mr. Bodine. No other nominations were made. The ballot having been taken the chairman declared Mr. Jansen Haines duly elected president in place of Mr. Samuel T. Bodine resigned. Resignation of Mr. Randall Morgan as first vice president. The resignation of Mr. Randall Morgan as first vice president was presented. On motion duly made and seconded Mr. Morgan's resignation was *excepted*. Election of Mr. Samuel T. Bodine as first vice president. Mr. Samuel T. Bodine was nominated as first vice president to fill vacancy caused by the resignation of Mr. Morgan. No

3590

other nominations were made. The ballot having been taken the chairman declared Mr. Samuel T. Bodine elected as vice president in the place of Mr. Randall Morgan resigned. And then this entry marked in red ink with an arrow, says insert this record, salary of Mr. Jansen Haines president. On motion the salary of the president was fixed at $833.33 per month from this date. That is July 1910. That is a correct record isn't it?

A. It may be a correct record, but my salary was increased on the first of the year.

Q. To how much on the first of the year?

A. To the $833.33.

Q. Your salary was raised just a short time before was it not, before the first of January?

A. Before the first of January, no sir.

Q. What was your salary for the year 1910?

A. $7500 as shown on the record there.

Q. When did that salary begin?

A. January 1, 1910.

Q. And then this change from $7500 to $10,000, when was it made?

A. January 1, 1911.

3591 Q. So that this entry was not a change in any sense, but it simply made that salary apply to the president?

A. Yes.

Q. To which you had just been elected so you were correct the other day when you said there was no change in your salary after the election?

A. Yes.

Q. And your term as president began shortly after this July meeting?

A. Began on July 10, I believe the date was.

Mr. BYERS: That is all if you will bring me in that estimate and take this exhibit I will furnish you and be able to state or have somebody else do it about this account of the U. G. I. that I refer to. I want also a description of the real estate covered by this item $1,649.26 and the extensions and improvements made in Valley Junction.

Cross-examination by Hon. GEORGE H. CARR:

Q. Will you explain or state rather whether the pressure in gas in mains, whether the resistance I should say, whether the resistance of gas in mains is greater up hill or down hill at the works?

A. The pressure will increase with the elevation.

Q. That is to say as gas leaves the works if the main goes up hill does it require more to overcome resistance of the gas than it would if the main went down hill?

A. Requires less to overcome resistance of the main if it rises leaving the works.

Q. Assume that the point of manufacture is on the same level as

3592 the point of consumption, but that between those points there is an elevation. Now I ask you whether it is necessary to have pushers to carry the gas to the highest point midway between the point of origin and consumption or whether the pushers are required to carry it down the hill on the other side?

A. You refer particularly to this?

Q. This Valley Junction line?

A. Pushers are really required to push the gas over the hill to the west limits of the city and the people in the west limits of the city had been kicking for some time for gas and we could not afford to supply these people at the same time unless we had additional consumption *of* Valley Junction and the whole system required the construction of these pushers and the high pressure system. Otherwise it would have meant a very large increase in the investment in mains which would not be warranted by consumption.

COURT: When you say you have a governor there what is that?

A. It simply maintains a constant pressure on the outlet, no matter what the pressure is on the inlet so we can overcome the frictional resistance of the main to that point by a high pressure on the gas and then when it reaches that point the governor automatically reduces the pressure if it is too high to the proper pressure at which it should be distributed. It performs the same function that a governor on an engine or transformer on an electric current.

COURT: Changes the pressure in there to suit the distribution system of Valley Junction. That is on the Valley Junction side.

Q. I call your attention to page 233 of the minute book which was read into the record and particularly to the recital near the bottom of the page as follows, the president thereupon stated that

3593 it was proper to request the trustee under the company's first mortgage dated March 1, 1906, to certify and deliver bonds equal to the amount of the above balance or $60,993.63, and I ask you whether you know what is referred to there as the company's first mortgage dated March 1, 1906?

A. It is the first mortgage authorized the first meeting of the directors as shown on page 19 of the minute book.

Q. Now will you refer to article 1 of that mortgage as found on page 26 of the minute book and read into the record article 1, showing the authorization referred to in the minutes that was read in the evidence.

Complainant offers and reads in evidence article one of the first mortgage bond beginning on page 26 and found on page 27 and page 28 of the record as follows:

A. ARTICLE 1. The issue of bonds to be secured by this mortgage is fifteen hundred (1500) bonds, of the par value of One thousand dollars ($1000) each aggregating One million five hundred thousand dollars ($1,500,000) at par, dated March 1, 1906, payable March 1, 1926, and numbered consecutively from one (1) to fifteen hundred (1500) both inclusive. Upon the recording of this mortgage all of the bonds hereby secured shall be executed by the gas company and delivered to the trustee

(1) Two hundred eighty five thousand dollars ($285,000) at par, of said bond- shall be issued at once certified by the trustee and be delivered to or upon the order of the president or vice president of the gas company.

(2) Four hundred thousand dollars ($400,000) at par of said bonds shall be retained by the trustee and shall not be certified until required to purchase or pay for, take up, exchange or replace bonds outstanding of the Capital City Gas light company due January 1, 1907.

3594 It is hereby agreed that the foregoing Four hundred thousand dollars ($400,000) at par of underlying bonds shall be taken up at their maturity and that their time of payment shall not be extended. Upon the maturity of said underlying bonds the trustee (in the event that said underlying bonds are not exchanged for bonds hereby secured and reserved) shall sell Four hundred thousand dollars ($400,000) par value of the bonds hereby secured and reserved at public or private sale as an- when requested by the gas company and out of the proceeds of such sale shall pay off and discharge so far as same are sufficient the said underlying bonds and pay the balance over to the gas company; and if the proceeds of such bonds shall not be sufficient to pay in full said underlying bonds the gas company shall pay to said trustee in cash the amount of any such deficiency for application by said trustee to the payment of said underlying bonds. All the said underlying bonds constituting the above mentioned issue when received in exchange as -foresaid or when paid shall be surrendered to and canceled by the trustee it shall, if practicable cause the mortgage securing same to be satisfied and discharged of record.

(3) The balance being Eight hundred and fifteen thousand dollars ($815,000) at par of said bonds shall be retained by the trustee and shall be certified and delivered from time to time by the trustee and shall be used by the gas company only for the purposes of making additions to or extensions or betterments of its plant or acquiring other plants or property real or personal. The trustee shall not deliver any of the bonds in this subdivision three referred to except upon resolution of the board of directors of the gas company calling for such delivery and stating that the bonds then called for are

3595 required for such additions extensions, betterments, repairs or costs as aforesaid, and also stating that said bonds or the proceeds thereof are to be used for one or more of said purposes; and a certified copy of such resolution under the seal of the gas company shall be conclusive evidence to the trustee of the truth of the matters therein set forth and shall constitute full and sufficient authority to the trustee to certify and deliver said bonds in the amount stated therein to be so required; and the trustee shall thereupon certify and deliver such amount of bonds to or upon the order in writing of the president or vice president of the gas company.

(4) The trust shall not be in any wise responsible for the application of any bonds or the proceeds of any bonds which may be certified and delivered by it in accordance therewith.

(5) Before certifying and delivering any bonds the coupons

thereon then matured shall be cut off, canceled, and upon demand the same shall be delivered to the gas company.

Redirect examination by Hon. H. —. BYERS:

Q. What is the name of that trustee?
A. Commercial Trust Company trustee.
Q. Where is it located?
A. It does not say here, but I believe it is Philadelphia.
Q. Who is president of it?
A. I don't know.
Q. Know any of the officers?
A. No.
Q. Judge Carr asked you about a pusher, a pusher is required to pus- gas down hill and not up hill, gas goes up hill all right?
3596 A. It is required to overcome resistance in mains whether it be a difference in elevation or a distance from source of supply.
Q. Where your system is loaded down with services at a long distance you use the pusher too don't you?
A. Depends on the size of the pipe.
Q. The truth of the matter is Valley Junction is higher than Des Moines, higher than where your plant is?
A. I believe about eight or ten feet higher.
Q. So really a pusher for Valley Junction is needed because it is so far away.
A. Yes, it is l-rgely to overcome the resistance. That depends of course on the size of the pipe, if you put it through a large pipe you would not need a pusher.

Recross-examination by Hon. GEORGE H. CARR:

Q. Do you know Mr. Haines how much higher the elevation is between the plant and Valley Junction than it is at Valley Junction. In other words, what is the difference between the elevation at Valley Junction and along about Greenwood Park?
A. The height or elevation we have to push over and down the other side, I think it is about 180 to 210 feet, it is along in there.
Q. The fact that Valley Junction is really higher slightly than the elevation of your plant make any material difference or does it tend to overcome to any extent the fact that between here and there there is a hill that you must go over?
A. It would tend to overcome that to the extent of the difference in elevation.
Q. That is the difference of the down hill?
A. Yes. Be very little practical difference if any, would
3597 not be measurable.
COURT: Is Valley Junction on the Coon river?
A. Yes. Well not right on the Coon river. I think about 400 yards from the river.
COURT: On a hill by the river?
A. No, sir; on the flat, right on the Rock Island tracks.
COURT: You say 800 feet high?

A. No, sir; I said Valley Junction itself is about 8 or ten feet higher than our plant.

Mr. BYERS: The main of course is about two feet under the river, the main is two feet lower than the bottom of the river here?

A. We would not measure from there, measure from the outlet of the pusher as far as pressure goes.

Here the further hearing was adjourned until 9:30 a. m. tomorrow.

3598 Tuesday Forenoon Session.

SEPTEMBER 19, 1911—at 9:30 a. m.

Counsel for the respective parties present, except R. O. Brennan.

Testimony on part of defendants resumed as follows:

JANSEN HAINES, continuing his direct examination, examined by H. W. Byers, Esq., testified:

Q. Mr. Haines, did you bring in Exhibit 18, I think it was?

A. I did.

Q. Now Judge Carr informed me that you would not be able to give me the information on account of the U. G. I. this morning?

A. I had four or five men working all night on it, but it is not ready; we have not been able to get it finished. I have here some of the contracts.

Q. I wanted the Brereton contract?

A. I haven't got that here; I looked for it yesterday but could not find it.

Q. What contracts do you have?

A. These are street main deposit contracts.

Q. Your counsel the other day, Mr. Haines, Judge Read, introduced into the record what was marked Complainant's Exhibit 27. I wish you would look it over and state whether it is correct, as you remember it?

A. This copy, as I understand it, has been made from the one on file; it appears to be all right.

Q. You signed it and swore to it?

A. Yes.

The MASTER: What is Exhibit 27?

Mr. BYERS: The tax statement for 1911.

The WITNESS: It is a statement that was made after the
3599 inventory was practically completed. The general contracts are enclosed in these envelopes.

Q. The memorandum on the outside indicates it?

A. Yes, the contract is enclosed inside and gives the form of the contract.

Q. Well, I will pick out one here that will answer my purpose. I have had the reporter mark as an exhibit the Percival-Porter Company contract, No. 10, on the envelope, under date of June 5, I think it is, 1909, and I ask you if that contract in its terms is the usual contract made by the company for this class of work?

A. You will have to let me see it, General. They are not all exactly alike, but practically all the same; sometimes there is some change in the street.

(Witness examines contract.) Yes, it is.

Q. You brought in five or six of those contracts, now let me ask you if that method has not been pursued quite generally in the building of these additions to the city of Des Moines in the last four or five years?

A. Well, it is by certain parties.

Q. Well, take the additions like Gil Mar Park and Hyperion Park Additions and the additions worked out and promoted by Witmar & Kauffman and that class of real estate men; it has been customary to give them that sort of a contract, has it not?

A. I can answer it better by giving the names of the people with whom we made contracts.

Q. All right, give us the names of the people.

A. Looking over the package here you will find the name of the party with whom the contract is made.

Q. Just give us the names of as many as you can remember?

3600 A. The Interstate Realty Company, Harwood of Gil Mar Park, the Percival-Porter Company——

Q. Is that the name of that concern now?

A. Harvey Porter is agent.

Judge CARR: Mr. Haines while you are calling attention to those, will you also give the date?

Q. Contract #3 is Interstate Realty Company. It was made under date of September 8, 1908; No. 5, J. W. Witmer—that is Joel Witmer.

Q. That is not the Witmer that is in partnership with Frank Kauffman?

A. No.

Q. The old gentleman?

A. No, it is another Witmer; that is under date of September 26, 1908. No. 6 J. M. Munsinger, under date of August 28, 1908. No. 7 John A. Larson, under date of October 7, 1908. Here is No. 4, the Interstate Realty Company, under date of August 29, 1908. No. 10, Percival-Porter Company, Agents, under date of June 15, 1909.

Judge CARR: Is that the exhibit referred to?

A. Yes, it is; Exhibit 37. No. 12, Percival-Porter Company, Agents, under date of 6-5-'09. No. 17, Interstate Realty Company, under date of May 25, 1910. Now you will notice I skipped some numbers and those perhaps are live contracts which have not been paid.

Q. Not cleaned up yet?

A. There are among those, I think there is one of—well I will bring you a list of those; I haven't got them here.

Q. If you will bring me such a list, I will be obliged to you. Now, the Brereton contract for the building, you haven't that?

3601 A. I haven't got that. I will look that up again; that is an old contract.

The defendants at this time, in connection with the examination of Mr. Haines, offer in evidence Exhibit 37, which reads as follows:

"DEFENDANTS' EXHIBIT 37.

Original.

JUNE 15, 1909.

Des Moines Gas Company, Des Moines, Iowa.

GENTLEMEN: If you will, at your own expense, extend your gas mains in Private Roadway West of an- running about parallel to 20th street from Washington to what would be Franklin Ave. and legally described as follows:

Commencing at a point 66.66 — South and 110 feet East of the North-west Corner of Lot Two (2) of the Official Plat of Section 33, Township 79, Range 24, West of the 5th P. M. in Des Moines, Iowa, there beginning: thence south 741.35 feet to the North line of Washington Street, thence East along said North line of Washington street 40 feet; thence North 741.35 feet; thence West 40 feet to the place of beginning (and bring connecting pipes for consumers inside of curb line in front of each lot on said streets) I will pay you the sum of Three Hundred Sixty and no 100 ($360.00) Dollars.

I make this payment solely that I may have the convenience of the use of the gas and for the improvement of my property, and clearly understand that by such payment I acquire no interest whatever in the mains (and connecting pipes) which you may lay in pursuance of this requesy.

Yours truly,

PERCIVAL-PORTER CO., *Ag't,*
By H. M. PORTER, *Sec'y.*

It is agreed upon the part of the Des Moines Gas Company that as each residence on the line of the mains above specifically described is completed, and said Gas Company commences to supply the occupant thereof with gas, that said Gas Company will return to Percival-Porter Co. Agent the sum of Forty-four and no/100 ($44.00) Dollars, until the whole said Three Hundred Sixty and no/100 ($360.00) Dollars is returned, provided that as soon as eight connections shall have been made, the balance remaining shall thereupon be refunded in full, and provided further that the agreement to return any balance that may then be unpaid shall cease after five (5) years from the day of the date thereof.

DES MOINES GAS COMPANY.
JANSEN HAINES, *Manager.*"

3602 Cross-examination by Judge CARR:

Q Now, Mr. Haines, will you explain to the Master the circumstances under which these contracts are made and the object and purpose of the contracts?

A. Well, these real estate men who are developing city property, platting ground, in order to sell their lots, find it desirable to have the gas mains extended in front of them before there are any buildings on the lots, and they make the request and make the offer to pay for the extension of those mains in front of their lots in the form of this contract to me, and we take the money and refund it to them on the basis of the proportion of one consumer for every 90 feet that is secured within a specified time, generally three *of* five years.

The MASTER: In other words, they are taking the risk of getting sufficient inhabitants there instead of you?

A. Yes, sir; if we undertook to put these mains in without any return, I think we would be called upon for 500 or 600 miles in Des Moines. Now if they want to put up their money, we are very glad to accommodate them to that extent. We do not encourage it, but are willing to do it if they want to invest their own money in the improvement for the sake of selling their lots; and when we do get a consumer for every 90 feet, we refund the money.

The MASTER: That is about the average distance of consumers in the outlying district?

A. That 90 feet is the distance required in our franchise; it is specified we shall run a main where a consumer can be secured for each 90 feet.

Q. You spoke, Mr. Haines, of this sum being paid to you. It is in fact simply deposited by these promoters as a guaranty that
3603 the Company will get the business?

A. That is in fact it.

Q. Then that deposit is returned to the promoter according to the terms of the contract.

A. Yes, sir.

Q. After a certain number of connections, a certain portion is paid back until there are connections enough to cover the terms of the contract, and the money is all paid back.

A. Yes, sir.

Q. Now your attention has been called to these other contracts and you say, while the terms vary slightly in principle, they are all the same?

A. Yes, in the contracts which we make now, we found it necessary to put in a little clause, by which if the grade of the street is changed before the termination of the contract we will withhold sufficient money to relay our pipe to the new grade.

Q. Mr. Haines, how long has this practice been in vogue?

A. About four years, I think; we have made some contracts in previous years, but hardly to the same extent they have been, because there have been more real estate additions laid out in late years than formerly.

Q. You spoke of a number of contracts you had made besides those that you have brought in some of them, were still live contracts?

A. Yes, sir.

Q. Do you remember making a contract of this character with a Mr. Walker, the man who was a witness here for the city on real

estate values; do you recall making a contract with him of this character?

A. I don't remember whether I personally made a contract with him, but a number of contracts were made with him in former
3604 years, when he developed this south Des Moines property.

Q. Just such contracts as these?

A. Similar to these, on the same principle. We make these contracts with anybody that insists on paying their money for the privilege of having the mains laid.

Q. Now, Mr. Haines, you were asked by General Byers whether the salary which you received from the Des Moines Gas Company for services rendered to the Des Moines Gas Company was paid over by you to the United Gas Improvement Company, and you said no; Now, I inquire whether the salary which you received from the Des Moines Gas Company is in full compensation for the services rendered by you to the Des Moines Gas Company?

A. Yes sir, if I understand what you mean.

Q. That is to say, now, the Des Moines Gas Company pays you for your services and pays you in full of your services for all your time rendered to the Des Moines Gas Company?

A. Oh yes.

Q. Now, are you under salary from the United Gas Improvement Co., for services rendered to the Des Moines Gas Company?

A. No sir; the only salary I draw is from the Des Moines Gas Co., and the only service which I render is to the Des Moines Gas Company.

Q. That being true, you receiving no salary from the United Gas Improvement Company for the services which you are rendering to the Des Moines Gas Company, is there any reason which occurs to you why you should pay over any part of your salary to the United Gas Improvement Company?

A. No sir, there is not.

3605 Redirect examination by H. W. Byers:

Q. I suppose you do not know really how bad they migh- need a little money, the United Gas Improvement Company,—I wanted to carry that joke a little further. If I understand this contract business, Mr. Haines, the Gas Company does not extend its mains unless the population of the consumers in sight are sufficient to at once bring a fair return for the cost of laying the mains, is that it?

A. Well, we do not determine the question whether it is a fair return or not; we are required to lay our mains where there is a consumer for every ninety feet; that is, we have construed our franchise in that way.

Q. That is under that socalled fifty year arrangement?

A. No sir.

Q. Before that?

A. Before that.

Q. As I said you now, you do not extend the mains unless there is a consumer within ninety feet of the end of the old one?

A. Yes sir.

Q. In order to extend them beyond that, or if a man wanted to secure gas service beyond ninety feet, you are willing to put it in and do put in the mains if the person interested, or a number of persons, as the case may be, if they will deposit with you the money to carry the original cost of putting in the mains with a contract, that will later on when a certain number of connections are made, he will get his money back.

A. It simply covers the cost of wages and material used in the laying of the main, that we may estimate is sufficient for
3506 the consumer to deposit.

Q. In other words, the company is not out any actual money for the laying of the additional main, if I understand you right?

A. Well, the company is out all the services incident to the cost of the main exclusive of the wages and material of simply laying the pipe in the street.

Q. What cost would there be?

A. Superintendence, engineering, and construction charges.

Q. You mean overhead charges?

A. Yes.

Q. The actual expense of the material itself, putting the mains in the ground, is covered by the deposit of the real estate man promoting the addition, or the individual who wants gas service beyond ninety feet.

A. Yes, wages and material.

Q. That you have been doing for about four years?

A. We have been doing it for a number of years in that way.

Q. The last four or five years there have been more additions added to Des Moines than in ten or fifteen years before.

A. There has probably been more of a gross in the city.

Q. How many consumers must be on a line to get the main?

A. In proportion of one to ninety feet.

Q. What is the average now in town?

A. I would have to figure that out General.

Q. I wondered if you knew?

A. No I do not keep track of that.

Q. That is the way that the extensions have been made under the contract similar to Exhibit 37 for the last four or five years

A. Not all the extensions; just simply extensions for the
3507 development of these real estate speculations.

Q. Of course that is what I am talking about, not the extensions in general which are made because of the necessities of your business; but with respect to all these additions where the real estate agents wanted gas at once before the addition was settled up, and filled up with consumers?

A. Yes, that is the idea.

Q. Now, Mr. Haines, what real estate has your company purchased since 1906 that they now own and use in the gas business?

A. I do not think there has been any additional real estate purchased since that time in the name of the Des Moines Gas Company. You are now referring to that $1,600.00 you noticed yesterday.

Q. I am just trying to find out now what real estate, if any, the

Company has purchased since 1906, or anybody else has purchased for them, which is now used in the Gas business.

A. None that I know of. I will say that $1,600.00, while I haven't got the details here, I think is to cover improvements to real estate and goes into the real estate account.

Q. I know Mr. Douthirt explained that to me last night.

Recross-examination by Judge CARR:

Q. Now, Mr. Haines, you were asked whether the extensions of these mains we have been talking about covered by these *con*contracts cost the company anything, and you pointed out that it cost them for expenses beyond the productive labor and material. Now, is that an accurate statement, doesn't when the money is paid back, after the promoter performs the terms of his contract, the Company is paid, are they not, for the extensions paying for the productive labor and material?

3608 A. Oh yes.

Q. So that it is not accurate to say that these extensions do not cost the company anything for the productive labor and material?

A. My understanding of the question was that it did not cost them anything at the time.

Q. So it is strictly accurate to say that this money paid in is simply deposited and goes back to the man who deposited it?

A. Yes. The total amount of these contracts do not exceed Two Thousand dollars for that street main deposit: the account will amount to less than Two Thousand Dollars at any one time and generally is very much less than that.

The MASTER: You simply are relieved of interest on the money.

A. Yes sir.

Redirect examination by H. W. BYER:

Q. You don't mean all of the contracts of that kind that have been made only amount to Two Thousand Dollars?

A. No, the amount in the open account of street main deposits. Some have been paid for, and more made.

Q. What you mean is that you probably haven't more than *Two* Two Thousand Dollars in money on hand on such contracts at any one time.

A. Not only probably, but actually.

Q. But the total amount of that class of contracts would far exceed Two Thousand Dollars.

A. Oh, I suppose it might run Three or Four Thousand Dollars.

Recross-examination by Judge CARR:

Q. You mean to say you have an average of Two Thousand Dollars of this fund in open account, or that Two Thousand Dol-

3609 lars is your estimate of the maximum which you had at any one time?

A. I think the figure is about $1,980.00, which is the maximum at any one time, which we have at present.

Q. At times it will be materially less than that?

A. Yes, particularly in the winter time, it will naturally run below that.

Q. The average for the entire period will be considerably below that?

A. Very much.

The MASTER: You spoke of some contracts that were not there; I don't know whether you meant to say whether the parties did not comply with the contracts, or what was said?

A. These contracts are made for periods from three to five years; that is to say, if the number of consumers required in the contract will be secured on that particular extension, are secured within that period, the money will be refunded, so much for each consumer. Now, the contracts are numbered from the first contract which was executed consecutively on down, and on some the total number of consumers required have already been secured, and the contract is paid off, and on others only a part has been secured and are not fully paid off.

The MASTER: Then there is still some money coming to them?

A. Yes, still money coming to the contractor.

Excused.

Mr. BYERS: The defendants now offer in evidence Exhibit
3610 39, being an affidavit of Edward T. Pratt, former manager of the gas company and filed in this court in the case entitled Capital City Gas Light Company, complainant, vs. City of Des Moines.

Objected to on part of complainant as being irrelevant, immaterial, and does not purport to show the value at any time, but merely an investment. It is also objected to because it does not purport to be a complete copy of the affidavit, but is in fact a copy of only one exhibit attached to the affidavit. It is objected to for the further reason that it is incompetent as going to the question of value, for the reason that you cannot prove value by the evidence of witness, or copies of them, relating to different matters made many years ago and where the witness is not produced for cross examination.

The defendants offer in evidence Exhibit 38, in connection with Exhibit 39.

The complainant interposes the same objection as last above made to Exhibit 39.

The defendants offer in evidence Exhibit 40, which is also offered in connection with Exhibit 39, and is a part of the affidavit
3611 and statement of Edward G. Pratt filed in this court in the same case above referred to, and certified by the Clerk of the Court.

The complainant interposes the same objection as last above.

The defendants also offer in evidence in connection with Exhibit 39, defendant's exhibit 41, which is the transcript of the *the* evidence attached to the affidavit of Edward G. Pratt, and shows or purports to set forth extracts of the evidence of Walton Clark, Wm. H. White,

as certified by the Clerk of the Court from pages 421 to 459 inclusive.

Complainant interposes the same objection as last above.

The defendants also offer in evidence, Exhibit 42, being the affidavit of Edward G. Cowdrey, filed in this court in the case entitled Capital City Gas Light Company vs. City of Des Moines, and certified to by Wm. C. McArthur, Clerk of the Court.

3612 Complainant interposes the same objection as last above.

The complainant moves to strike out each of the exhibits offered by the defendants, from 38 to 42 inclusive, for the reasons urged against the exhibits, and also because it appears from the exhibits, that they are exhibits filed in a suit, not between the same parties and to which the complainant was not a party.

W. F. DOUTHIRT, re-called on part of defendants, examined by H. W. Byers, and testified as follows:

Q. I am calling you now because you suggested to me yesterday on one or two occasions when Mr. Haines was on the stand, you could give me the information I was seeking at that time. Council for the complainant introduced and had read into the record as a part of the cross-examination of Mr. Haines, a certain mortgage executed by the Des Moines Gas Company in 1906, naming the Commercial Trust Company as trustee; where is that institution located, where is its headquarters?

A. In Philadelphia.

Q. What is its business generally?

A. It is a Trust Company and does a banking business; also acts as trustee under mortgages, trustee of estates, acts as registrar of stocks, and performs generally the functions of a trust company as they are understood in New York and Philadelphia.

Q. Do you have any connection with the Company?

A. None whatever.

3613 Q. Does it have any relation to the U. G. I.

A. None.

Q. Who is its President?

A. Mr. T. DeWitt Cuyler.

Q. Does he have any connection with the U. G. I.

A. No sir.

Q. This trustee, as I understand it, simply has the custody of the bonds of $1,500,000.00 in bonds that were authorized to be issued at the commencement of the business of the Des Moines Gas Company.

A. The mortgage is the best evidence on that subject; that is in the record.

Q. Well, aside from the mortgage, you know that to be the case do you not.

A. The mortgage fully describes the duties of the trustee with respect to the bonds.

Q. Well, but it does not state, at least not so that I get the information, just the method of handling these bonds.

A. Yes, it fully states the method.

Q. The trustee holds the bonds.

A. I prefer to answer these questions from the mortgage itself. The mortgage is the contract under which the trustee proceeds and it fully describes and defines the powers and duties of the trustee.

Q. I simply want to get at, if I can in my own way, the method of taking care of these bonds?

A. You want me to construe the mortgage.

Q. Well, the trustee has nothing to do with the mortgage, except that the mortgage limits the trustee's powers with respect to the bonds.

3614 A. The trustee has very much to do with the mortgage; the mortgage is the document under which the trustee acts, and the trustee must look to the mortgage for every step the trustee takes.

Q. The trustee begins by having possession of that $1,500,000.00 of bonds, is that correct?

A. The trustee begins by taking a copy of the mortgage before it is executed, and referring it to its counsel to determine whether the mortgage is in such form as to make the trustee willing to accept the trust.

Q. Then what is done?

A. If the mortgage is in form, satisfactory to the trustee, and the trustee's counsel so advises, then the mortgage is authorized by the mortgagor and executed both by the mortgagor and the trustee.

Q. And what becomes of the bonds?

A. The powers and duties of the trustee with respect to the bonds are fully set forth in Article I of the mortgage, which was read into the record by Mr. Haines yesterday, and which I shall be glad to read again, or if you prefer, construe it for you.

Q. What I want to know, were the bonds issued at the same time of the mortgage?

A. No sir; the bonds have not all been issued yet.

The MASTER: He wants to know if they were executed?

A. Yes, Article one of the mortgage provides as follows: Upon the recording of this mortgage, (which I understand means recording of it in the office of the recording officer, of the County where the property is located, in Polk County, Iowa) upon the recording of this mortgage all of the bonds hereby secured shall be ex-

3615 ecuted by the Gas Company and delivered to the trustee.

Q. So that at the beginning then, these $1,500,000.00 authorized issue- were delivered to the Commercial Trust Company at Philadelphia?

A. They were executed by the Des Moines Gas Company and delivered to the Commercial Trust Company, Trustee; but you will note that the bond itself contains this clause. This bond shall not be valid until it shall have been authenticated by a certificate hereon duly signed by the Trustee under the mortgage.

Q. That is all right. I simply wanted to find out how the business is done. Now, beginning then with the issue of $1,500,000.00 bonds of the Des Moines Gas Company, in the hands of the Com-

mercial Trust Company of Philadelphia, as Trustee, just what method does the Des Moines Gas Company pursue in directing and delivering the issuance and delivery of the bonds?

A. I think you will lead us into a misapprehension on the word "issue." These bonds although they were signed by the Gas Company at the time of the recording of the mortgage, and delivery to the trustee, signed by the Gas Company, are not a valid obligation until authenticated by the Trustee.

Q. And delivered for the proper purpose?

A. Yes. And they are not issued, as I understand the meaning of the word issue, until they have been so authenticated, by the trustee, and delivered back to the Gas Company, and further until the Gas Company for a proper consideration has parted with the title.

The MASTER: Then the Treasurer of the Gas Company disposes of them in the market.

3616 A. Yes, sir.

Q. This $1,500,000.00 in bonds, as I understand your testimony, and the terms of the mortgage, was authorized for the purpose of covering the extensions and improvements upon the Des Moines Gas plant.

A. In part; that is part of them were authorized for that purpose.

Q. What were not authorized for that purpose were authorized to pick up the then outstanding bonds of the Capital City Gas Light Company, which had been assumed by the Des Moines Gas Company.

A. In part.

Q. What do you say as to the purpose in making the mortgage at the time it was made and authorizing the issuance of the bonds, being to make it possible—in other words, to provide the means for the Des Moines Gas Company to pay for its extensions and improvements as they were made by the sale of these bonds?

A. It was the purpose and intention to provide bonds, which, if they could be sold, would provide the means to make these extensions.

Q. That was the purpose for which the Company had executed the mortgage in the first place, to provide bonds?

A. To provide for the future issue of bonds which if it could sell them would furnish funds for extensions.

Q. All the extensions and improvements that have been made by the Des Moines Gas Company in the last four years, and a fraction, since March 1906, have been taken care of by the sale of a portion of these bonds, is that true or not?

A. No, that is not true.

3617 Q. What is the fact about that?

A. The fact is, that the Company has not been able to sell the bonds for enough money to take care of its extensions and improvements.

Q. Who purchased the last issue of bonds?

A. The United Gas Improvement Co.

Q. Who purchased the issue just prior to the last issue?
A. The same company.
Q. Who purchased the first issue?
A. The same company.
Q. The truth is, that all of the bonds of the Des Moines Gas Company represented by that mortgage that has been read into the record, were sold by the Treasurer of the Des Moines Gas Company to the United Gas Improvement Company.
A. Yes.
Q. And the United Gas Improvement Company still holds them?
A. No, it does not hold all of them.
Q. What has become of them?
A. It sold some of them, or exchanged them for other securities.
Q. You say it has sold some of them?
A. Yes.
Q. What part?
A. I can't tell you exactly; I think something like Three or Four Hundred Thousand Dollars.
Q. When?
A. As much as two or three years ago.
Q. Does the United Gas Improvement Co. operate any gas plant anywhere except the Philadelphia plant, under lease?
A. Yes.
Q. Where?
3618 A. One at West Waterbury, Conn.
Q. Any other?
A. One at Vicksburg, Mississippi.
Q. Any others?
A. No, not that I remember.
Q. All of the other concerns you were interrogated about on a former occasion of this trial, the U. G. I. simply owns stock in them.
A. I wouldn't like to make such an inclusive answer as that. I will say generally speaking, the United Gas Improvement Co. occupies the relation of stockholder to most of the companies in which it is interested.
Q. I want to get back to this bond proposition, until I clear it up to my own satisfaction. On page 233 of this record that has been referred to several times as the Des Moines Gas Company, No. 1 stockholders' and directors' minutes, is set out what purports to be a statement prepared by the treasurer of the Des Moines Gas Company, which in substance states—that since March 1, 1906, to December 31, 1910, $472,993.63 has been expended for additions, extensions, betterments of the plant of the Des Moines Gas Company. Now, the statement also indicates that of that amount $412,000. has been absorbed or taken care of by the issue of bonds. The bonds referred to are the same bonds we are talking about now, and covered by the mortgage just referred to in your testimony.
A. Yes.

Q. Now, that left a balance as the treasurer states here, for which bonds may be issued at par of $60,993.63.

A. Does it say issued there?

3619 Q. Yes, it uses these very words. If I have studied this book to any purpose at all, what little time I had to look it over, I get this notion from it, and from these regular annual statements of your treasurer, Mr. Lilly, who, I understand, is also treasurer of the U. G. I., that during the year, whatever extensions, improvements and betterments are made, whatever money is needed for that purpose, the U. G. I., aside from what the local company has on hand, furnishes the money to the Des Moines Gas Company, and takes its obligation bearing interest at six per cent, and covering in addition to the money advanced for this purpose, such open account as the company may have, that is the U. G. I. may have, with the local company, and that paper is carried until the end of the year, the end of the year that Mr. Lilly has chosen in which to make his annual statement, and then upon his statement as to the amount that has been put into the property in the way of extensions, betterments and improvements, and whatever the U. G. I. has furnished in money and service, as the case may be, is taken care of by an issue of bonds and the sale of bonds to the U. G. I.; is not that about right?

A. No that isn't right at all.

Q. What is wrong with it?

A. If the reporter will write out for me a copy of that very long and involved question I will undertake to dissect it and show where it is wrong.

Q. Well, I will put it in another way; maybe we can get at it without going to that trouble. Going back in this defendant's exhibit 27, it is true, is it not, that the beginning with the first year of the operation of the Des Moines Gas Company, under

3620 that name, down to and including the year 1910, the treasurer of the company has made regular annual statements covering the expenditure of the Des Moines Gas Company.

A. No, I think that is not true; I think those statements are not made annually.

Q. How often are they made?

A. If you will let me have the record, I will pick them out for you.

Q. Can't you tell in a general way?

A. Yes, I can tell you for the last two years or so the statements have been made semi-annually and prior to that time I think the record will disclose they were made at irregular periods.

Q. Just find the last one before the one on page 233.

A. Wouldn't it be better to take the first one and go right through.

Q. If you want to take the time to do that, and if you prefer to do it that way—I want to know all you know about this business, just exactly how this property is handled, what is done with these bonds, what is paid for them, how they are gotten out of the hands of the trustee, upon whose order or direction they are turned

over, if at all, to the United Gas Improvement Company. I don't intend to leave anything under cover if I can get to it in any way.

A. The mortgage of March 1, 1906 with respect to the $815,000.00 of bonds which were reserved for the purpose of making additions, extensions and betterments, provides: That the trustee shall not authenticate and deliver any of these bonds except upon a resolution of the Board of Directors of the mortgagor calling for such delivery, and stating that the bonds at the time called for are required for the purpose of extensions, additions or better-
3621 ments, and stating also that the bonds or proceeds thereof are to be used for this purpose.

Q. Then, right there now, if I understand that, all that was necessary at any time for the U. G. I. to secure the delivery to it from this trustee of bonds to cover expenses, and improvements that were actually made, was to have a resolution passed by the Board of Directors of the Des Moines Gas Company setting forth the fact that the money had been expended or was needed for that purpose and directing the treasurer to certify the resolution and that fact to the trustee, and upon that certification the bonds would be turned over to the U. G. I.

A. That is not right. In my answer to the question preceding that, I was going on to describe the whole process.

Q. I beg your pardon for interrupting you; go ahead and do it in your own way.

A. Well, I will refer back again to my answer to the question preceding the last one, in which I stated the provisions of the mortgage with respect to the certification and delivery by the trustee of any part of the $815,000.00 bonds mentioned in Article I of the mortgage as reserved for the purpose of additions, extensions, and betterments. The provision is that the trustee shall not certify and deliver any of the bonds mentioned, except upon resolution of the Board of Directors of the Des Moines Gas Company, calling for the delivery and stating that the bonds are required for additions extensions and betterments and also stating that the bonds or the proceeds thereof are to be used for the purposes mentioned.

Q. I wanted to understand a word you read there. I do
3622 not have the mortgage before me. Does that say or required for extensions?

A. Stating that the bonds then called for are required for such extensions, etc., and also stating that said bonds, or the proceeds thereof are to be used for such purposes, and a certified copy of such resolutions under the seal of the Gas Company, shall be conclusive evidence to the Trustee of the truth of the matters therein set forth, and shall constitute full and sufficient the authority to the trustee to certify and deliver said bonds in the amounts stated therein to be so required. That is a provision which is quite customary in mortgages of this sort, and is intended for the protection of the bond holder, so that no bonds may be certified and delivered by the trustee unless the mortgagor has actually spent in extensions and betterments the money.

Q. That does not say it must be actually spent does it?

A. Well, it says the bonds which are required for that purpose and the course which has been follo-ed under this mortgage, is that the money has actually been spent before the trustee is asked to certify and deliver bonds.

Q. In the meantime, the Company has paid six per cent interest on the money?

A. Oh no, not at all.

Q. That is the way it looks to me.

A. Well, it looks wrong to you, I am sorry to say. Now you will note the date of that mortgage was March 1, 1906. On June 30 1906, the minutes on page 68 show that a statement was presented to the Board of Directors——

Q. What is the date of that?

A. This was presented to the Board at a meeting
3623 August 16, 1906, and appears on page 68 of the records. This statement shows from March 1, 1906 to June 30, 1906 the Company had expended the sum of $58,730.77 in making extensions, betterments, etc. The Board at that meeting passed a resolution certifying to the trustee that the sum of $58,730.77 had been expended for the purposes mentioned, and requested the trustee to certify and deliver $58,000.00 of bonds, leaving the odd amount out.

Q. Take up that case as a concrete case. Now, where had the Company gotten the money, the $58,000.00 it had spent up to that time?

A. I couldn't tell you without referring to the books which cover that period of operation.

Q. Part of it was gotten from the U. G. I.

A. I cannot tell you without referring to the books covering that period of operation.

Q. At any rate, the money expended up to that time had been provided in some way to the Des Moines Gas Company, either borrowed it here or it came out of the receipts, or the U. G. I. loaned it to them.

A. The money had been either the result of their operations; it had either been receipts from operations or borrowed from somebody.

Q. Now right at that point, this $58,000.00 that the record shows had been invested in the plant, all that was necessary to get bonds enough to cover that, was for the directors of the Des Moines Gas Company to pass a resolution setting forth the fact of the expenditures for the purpose for which they were made, and directing the treasurer to certify the resolution to the trustee, and upon that certification, the trustee would deliver the bonds to the U. G. I.
3624 A. No.

Q. Isn't that right?

A. No.

Q. What is the matter with it?

A. The U. G. I. had nothing to do with it.

Q. Let me put it in another way; of course I can see how you might answer that no and be right. Mr. Lilly was the treasurer of both companies.

A. Yes.

Q. He did the certifying to the trustee.
A. No.
Q. Who did?
A. The Secretary.
Q. Who was the Secretary?
A. At that time, Mr. W. A. McEwen.
Q. He would certify the resolution and the trustee would turn the bonds over to Mr. Lilly who was treasurer of the Des Moines Company, and was treasurer of the U. G. I.
A. The trustee would follow the directions of the resolution and the resolution I am now reading from the record authorizes the trustee to deliver the same to or upon the order in writing to the President of the Des Moines Gas Company.
Q. Who was president of the Des Moines Gas Company at that time?
A. I think Mr. Bodine was.
Q. What relation did he have with the U. G. I.
A. First Vice President.
Q. Then Mr. Bodine when these bonds were delivered to Mr. Bodine went through the form of selling them to the U. G. I.
A. I would say he sold them.
Q. He sold them to the U. G. I., the company you say took the bonds.
3625 A. Yes.
Q. Then the U. G. I. when the money was received, the treasurer of *of* the Des Moines company who was the treasurer of the U. G. I., would simply enter upon the books the credit to the Des Moines Gas Company, whatever it should be.
A. No, he wouldn't do that; he would collect the money, and deposit it in the Des Moines Gas Company's bank account.
Q. He would actually collect the money already spent, even though the U. G. I. had furnished part of it, is that the idea?
A. Why, he would carry out the transaction just as if the bonds were sold to you.
Q. Well that is to say, then that particular issue, Mr. Bodine would sell the bonds to the U. G. I., who would act for the U. G. I.
A. Probably Mr. Lilly, or perhaps the Board of Directors of the U. G. I., or one of its committees.
Q. And the U. G. I. then would pay him in cash the amount of the bonds less whatever discount might be agreed upon.
A. Yes.
Q. And then Mr. Bodine would turn that over to Lilly, the treasurer of both companies, the agency.
A. Yes.
Q. And Lilly would make an entry of it in the books that he keeps in Philadelphia.
A. Lilly would deposit it in the bank to the credit of the Des Moines Gas Company, and make the proper entries.
Q. That is the way it is done is it?
A. Yes.
Q. What was the discount on these bonds?

A. On that particular lot, I couldn't tell you without referring to the books covering the operations of that period.

3626 Q. No trouble about selling them; did they have to coax the U. G. I. to take them.

A. Yes, I have seen the U. G. I. very reluctant.

Q. It was the U. G. I.'s own obligation was it?

A. No.

Q. The U. G. I. owned the Des Moines Gas Company.

A Yes,—no.

Q. You came pretty nearly going wrong on that question?

A. You very nearly mislead me.

Q. The books show and you know it to be a fact that the U. G. I. held all the stock of the Des Moines Gas Company.

A. Yes.

Q. Nobody else had any financial interest in the property of the Des Moines Gas Company except the U. G. I.

A. No, I wouldn't say that was so.

Q. Can you think of anybody else?

A. Yes; at that time there was $400,000.00 bonds of the Capital City Gas Light Company outstanding at that time. Those bond holders certainly had a financial interest in the property.

Q. That is what you thought I was getting at.

A. I didn't know what you meant by financial interest.

Q. I meant financial interest in the property as owners or part owners of the property.

A. Nobody else held any stock.

Q. Except the U. G. I.

A. That is right.

Q. So that the bonds that the U. G. I. was taking was simply the obligation of the company in which it owned all of the stock?

A. That is right.

3627 Q. And they discounted the bonds ten per cent at that time.

A. I can't tell you that without referring to the books covering that period. I know we discounted some bonds ten per cent; Whether this particular lot or not, I couldn't tell you.

Q. Is this a correct statement Mr. Douthrit; Mr. Haines on the witness stand yesterday said, whenever he had to have money here for the purpose of making extensions and improvements, and so on, and he didn't have the money, he got the money from the U. G. I. and paid 6% interest on it and that the open account of the U. G. I. after thirty or sixty days, interest was figured on that at 6%. Now, from some time, say from the beginning of the life of this corporation, the Des Moines Gas Company, the business has been carried on just as Mr. Haines said, the U. G. I. furnishing the money, taking 6% interest on it until such time as it desired to have the bonds disposed of and then they were disposed of, is that right?

A. If I should answer that question, yes or no, it would lead to misapprehension.

Q. Is there any question but what the U. G. I. determined origin-

ally just when a bond sale should be made,—I use the *the* word originally there to get away from your resolution and getting back to the actual direction of the making up of the record of the disposition of the bonds.

A. No.

The MASTER: Right here I would like to ask a question. I notice by the report of Mr. Hagenah that between February 28, 1906 and February 28, 1907, there was $418,914.28 for total extensions and improvements to that time. I find there was only authorized bonds of $58,000.00 on extensions and improvements that were issued under the resolution dated August 15, 1906.

3628 A. Yes sir.

The MASTER: How do you account now for the difference between that $58,000.00 and $418,000.00?

A. $418,000.00 was the amount spent up to February 28, 1906.

The MASTER: No; Between February 28, 1906 and February 28, 1907 this amount $58,730.77 is the expenditure from March 1, 1906 to June 30, 1906.

A. There is a difference in the dates there.

The MASTER: But there is no other bond issue and there is a difference of over $360,000.00.

A. I don't get just what you are getting at.

Mr. GUERNSEY: Mr. Hagenah says the $418,000.00 includes that $285,000.00 bond item that went for the holder and that sort of thing.

The WITNESS: Does that answer you?

The MASTER: I don't know; I am asking you the question; I don't know whether it does or not.

A. At the directors meeting March 20, 1907, there was a statement presented to the board showing the total expenditures for additions etc., from March 1, 1906 to December 31, 1906 amounting to a total of $129,282.11.

Mr. BYERS: Is that the second?

A. That is the second.

The MASTER: In 1906?

A. Yes, December 31, 1906, the total from March 1 1906 which is the date of the mortgage, to December 31, 1906, was $129,282.11 from which is deducted the $58,000.00 certified under the resolution of August 15, 1906, leaving a balance of $71,282.11 at that time.

3629 The MASTER: That makes a difference still of something over $4000.00.

A. So there would be; Mr. Hagenah covers two months more than is covered here. We are working on different scales; That would undoubtedly explain the difference. No doubt the difference between this figure which you have here and Mr. Hagenah's figure which amounts to about $4000.00 is covered by the extra two months which Mr. Hagenah has included in his statement as he has made it up.

The MASTER: It is $4,622.17.

A. Yes sir that is covered by the extra two months which Mr.

Hagenah has in his statement. Under the resolution adopted by the Board on March 20, 1907, which appears on pages 87, 88, and 89 of the record, the trustee certified $71 000.00 in bonds.

Q. Well now, without taking the time to go through that all, that issue was disposed of in the same way as the former one was, that is, the resolution was certified by the Secretary, and the trustee in response to the certification would deliver the bonds to the President of the Des Moines Gas Company, who was an officer in the U. G. I., and then the bonds were sold by that officer to the U. G. I. at whatever discount was agreed upon at the time.

A. Yes.

Q. And the money or credit or whatever it was, actual money, that would be in the bank and credited to the Des Moines Company and whatever obligations or accounts there was between the *the* U. G. I. and the Des Moines Company, would be adjusted either at the end of the year, or at that time.

A. Adjusted, yes.

3630 Q. When the President of the Des Moines Company negotiated the sale of the bonds to the U. G. I. and receiver the money for them, if the U. G. I. at that time was holding the obligation of the Des Moines Gas Company, in the form of a promissory note, then that note would be paid out of that money; is that the way it is done?

A. Yes, the Des Moines Gas Company would want to stop interest on that note.

Q. All that class of obligations between the Des Moines Gas Company and the U. G. I., where they drew interest at all, was at the rate of 6%?

A. Yes.

Q. And these bonds drew interest at 5%.

A. Yes.

Q. So that every time the Des Moines Gas Company made extensions and improvements with money furnished by the U. G. I., at 6% interest, instead of disposing of the bonds and using the money from the bonds to make that extension and improvement, would be just one per cent short, wouldn't they?

A. I don't understand that.

Q. The mortgage provides that bonds may be issued before the extensions and improvements be made after certification.

A. It was never done.

Q. When you didn't do it and adopted the other method, it was more expensive to the Des Moines Company?

A. You assume the Des Moines Company could have sold the bonds at par.

Q. Certainly, or at least the same rate they finally did sell them.

A. That is unwarranteed.

3631 Q. The MASTER: After paying the interest on the bonds that is about the only fixed charge there is.

A. That and the interest on the preferred stock contracts.

The MASTER: What becomes of the balance of the profits?

A. They have always gone into the property. I want to modify

that; any cash remaining over has been used to retire preferred stock contracts.

Q. These preferred stock contracts are held by the U. G. I.

A. Yes.

Cross-examination, Mr. GUERNSEY:

Q. Now pursuing the same line of General Byer's examination, if the U. G. I. Company held all of the stock in the Des Moines Gas Company, as you say it did, can you imagine any profit the U. G. I. Company could derive, assuming there was one, by charging six per cent on these advances instead of taking five per cent bonds?

A. No.

Q. In the ultimate result?

A. Not in the final windup.

The MASTER: If I understand the question of interest here, so far as the cost of gas is concerned, the question of interest on extensions or notes or bonds, and all those things, don't enter into it at all.

Mr. GUERNSEY: That is right.

Mr. BYERS: That is not our understanding of it; we do not concede that at all.

Mr. GUERNSEY: I understood your Honor to be talking of our actual figures; the actual figures introduced on *on* both sides
3632 do not include the items of interest on the bonds and things of that kind at all.

Mr. BYERS: Does not include items of interest on bonds, but does include interest on these obligations.

Mr. GUERNSEY: That I am advised is an error. You will remember there cannot be any difference between us. These adjustments of their operating accounts with ours does not show anything of any consequence and could not affect the results at all.

Q. Now, to go back—Counsel ask whether the U. G. I. was coaxed to buy these bonds, or did the fact that the U. G. I. was stockholder and had to put up this money to enable it to do business coax it to take the bonds.

A. That helped, yes.

Q. In other words, a public utility in a place like Des Moines, growing rapidly contemplates not only the original investment but continual additions to it.

A. Exactly.

Q. So that the man who puts his money in it must expect that he cannot make an investment of a million dollars or two million dollars, but that he must constantly add to that investment.

A. He must face the certainty that fresh capital is going to be required every year, almost every day, and Exhibit 18 which is now in General Byer's possession will show the estimates that are made.

Q. So that if he makes this investment, he don't make the investment under circumstances where he knows if he is sick of it he can retire, but he makes it and he knows that he must continually add to it whether he likes it or not.

A. Yes sir.

Q. It he doesn't add to it, he is going to lose his original
3633 investment.

A. Yes.

Q. Was it this fact that the Des Moines Gas Company had to have money in order to protect the investment of the U. G. I. Company in its stock, that coaxed the U. G. I. Company to buy these bonds?

A. That was it.

Q. Now then, Counsel said nobody else held stock but the U. G. I. Company in view of that fact was there anybody else on whom the U. G. I. Company could call to advance this money.

A. Nobody.

Q. So that one benefit the Des Moines Gas Company has derived from the fact that the U. G. I. Company owned this stock was that it had somebody constantly to put up this money that it needed in connection with its business.

A. To perform its obligation to the public, yes.

Q. You said the U. G. I. Company bought these bonds. I want to ask you whether the U. G. I. Company tried to sell the bonds to *to* others.

A. It has.

Q. Has it found others to buy them on as favorable terms it gave itself?

A. It has not.

Q. Is it willing to sell the bonds it has now to our friends on the other side at par?

A. They can have them all if they want them.

Q. In other words, the reason they are carrying them, there isn't anybody else that will carry them on as favorable terms.

A. No.

Q. Is there any other reason than that?

3634 A. No.

Q. If the U. G. I. wouldn't put this money up what would be the alternative that would confront the Gas Company?

A. It would have to sell its bonds for whatever it could get for them, or it would have to go without making extensions and improvements.

Q. That would mean wrecking it ultimately?

A. Ultimately. I do not suppose the public of Des Moines would stand for that very long.

Q. So that if this stockholder had not advanced the money, the Des Moines Gas Company would have had to buy that service for whatever it had to pay for it in the market.

A. It would.

Q. In the meantime, assuming the fact that the U. G. I. Company was the sole stockholder and proposed to continue the sole stockholder, could it make any profit out of the transaction whatever ultimately.

Objected to on part of defendants as not proper cross-examination.

A. No it could not.

Q. The U. G. I. Company would get interest on the bonds as long

as it owns them, in return for that interest would have to put up its money to buy them.

A. Yes.

Q. And buy them at a price higher than the bonds were salable in *in* the market.

A. I think so.

Q. This also relieves the local people from all the work and anxiety that would be incident to trying to finance this proposi-
3635 tion if the U. G. I. Company did not furnish this financial backing.

A. Yes.

Mr. BYERS: Who do you mean by the local people,—the employees.

Mr. GUERNSEY: Yes, somebody would have to do the work of selling bonds.

Q. And it also assures the Des Moines Gas Company that whatever the financial situation is, it will have what money it needs without paying exorbitant prices for it.

A. Yes.

Q. Now then, I want to go for a moment to Counsel's proposition as to the way in which he would finance improvements and issue bonds at first. Of course a part of the improvements is paid for out of the earnings.

A. Yes.

Q. So that until it is completed, you wouldn't know how many bonds would be required?

A. Yes.

Q. In the next place if you issued the bonds, first sold them, your interest on the total amount would begin then.

A. Yes.

Q. The bonds also would have to be sold at a discount unless sold to the U. G. I. Company?

A. I think that is true, yes. I don't think a five percent bond on this gas property would sell at par, or I don't think that it would sell at the price the U. G. I. Company paid this company for them. That is, however, a matter of opinion largely.

Q. It would be necessary to emply a broker to sell them.

3636 A. Necessary to employ someone who knew how to sell securities.

Q. There would be some expense there?

A. Yes.

Q. So that it won't do in order to compare these two methods of doing the business to merely compare the rate of interest that a short time note bears with the interest rate of the bond.

A. No.

Redirect examination by H. W. BYERS:

Q. What do you mean by a man wouldn't put his money in; the U. G. I. is the sole owner of the stock in this company?

A. Yes.

Q. Have they ever put any money into this plant at all except the money that is represented by what they have taken these bonds for.

A. Oh yes.
Q. What other money did they put in?
A. Well, when they made the original purchase of stock.
Q. What did they put into it then?
A. Of the Capital City Gas Light Company, back in '86.
Q. What money, how much money?
A. I don't know.
Q. Did they put in a dollar except what was then represented by bonds.
A. I would have to investigate the accounts.
Q. The truth is, all there is to this whole proposition Mr. Guernsey has been inquiring about, is the fact that the U. G. I. has financed its own property, property in which it is the sole stockholder,
3637 by the purchase of these bonds, so called purchase of these bonds and the money that it has credited to this Des Moines Gas Company in exchange for bonds.
A. If you will cut that question off after the word bonds, where it first occurs, I will answer yes.
Q. The truth is that every dollar that has gone into this Des Moines Gas plant is represented by the indebtedness that stands against it today.
A. I wouldn't say that.
Q. What other money has gone into it except the earnings?
A. Well,——
Q. What other money, original investment, has gone into this plant, except what is represented by the outstanding indebtedness of the company today?
A. That requires an analyzation of the whole situation.
Q. Has any gone into it at all?
A. I would say yes.
Q. From the U. G. I.?
A. What difference does it make?
Q. Has the U. G. I. put in any other money into the Des Moines Gas plant than what is represented by the outstanding indebtedness, unless it would be what is represented by what has already been cancelled by the earnings.
A. As I understand it, some of these six percent contracts have been retired; some of these six percent preferred stock contracts have been retired.
A. Aside from that all the money the U. G. I. has ever put into this property is represented by outstanding indebtedness, is it not?
A. I could not answer that without analyzing the whole situation from the beginning.

Excused.

3638 At this time, 12 m. an adjournment was taken until 9:30 a. m. September 20, 1911.

Wednesday Forenoon Session.

SEPTEMBER 20, 1911, at 9:30 a. m.

Counsel for the respective parties all present.
Testimony on part of defendants resumed as follows:

Prof. EDWARD W. BEMIS, being first duly sworn on part of defendants, examined in chief by Hon. H. W. BYERS, testified:

Q. Give the reporter your name and residence?
A. Edward W. Bemis; residence, New York City.
Q. How long have you been a resident of New York City?
A. Since January 1910.
Q. What is your profession or business?
A. I have been a statistician and student, an investigator of these municipal questions—monopolies, as I call them—public utilities, for a good many years.
—. I wish you would state just what your training has been along the line of public utilities, your general training?
A. After graduating at Amherst in 1880, and taking four years at the Johns Hopkins University in special studies, economics and history and political science, I went into college work. For five years I had charge of history and political economy at Vanderbilt University at Nashville, Tennessee; that was up to 1892. During the next three years, from 1892 to the summer of 1895 I was Associate Professor of economics and sociology in the University of
3639 Chicago; then fro two years I was doing general statistical work for the state of Illinois and the United States Government, and for several cities.
Q. I wish, as you go along, Professor, you would state the character of the work, beginning now with Illinois, the character, and the scope and so on of the work and investigation?
A. First let me finish the teaching period. From 1897, the summer of 1897, until the summer of 1899, two years, I had charge of economics and history at the State Agricultural College, Manhattan, Kansas, making in all ten years of college teaching. I had been always interested, and a student of public utilities, but my attention was especially directed to the subject by Professor Seligman, of Columbia University, in 1890, when he asked me to prepare a paper on the subject of municipal gas works in the United States for the American Economic Association. This I did and it led to a request that I enlarge it into a monograph or what might be called a small treatment of the subject, 150 pages perhaps, which was printed by the American Economic Association in 1891, I think. In 1892, while still at Vanderbilt University, I was interested in a movement for cheaper gas in Nashville, which led to our employing expert engineers from R. D. Wood & Company and Bartlett, Haywood & Company to investigate the subject. I forget whether we employed men from both companies or from one. We corresponded with both. Then I was employed in the first gas case I ever was on here at Des Moines, in the spring, I think it was, or late winter of 1892.
Q. 1892?

A. 1892, nineteen years ago?

Q. What was the character of that investigation which was on in that suit?

A. It related to a reasonable price for gas here in Des Moines?

3640 Q. What, if anything, did it have to do with the value of the property of the gas plant and apparatus and so on?

A. The value of the property and the operating costs were as usual two vital points in the matter.

Q. Both involved in that controversy?

A. Yes. The deposition was taken from me on the same subject, in the case in 1895, but the deposition was taken in Chicago, I think, and I did not go on to Des Moines at that time. In 1896, immediately after leaving the University of Chicago, I was employed by the state of Illinois to make a report upon the gas and street railway franchises of Chicago, which was published as a part of the report of the Bureau of Labor Statistics of Illinois for the year 1896.

Q. What was involved in the preparation of the material for that report?

A. I had to go through all the financial reports of the Company, all the documents of the companies, street railway and gas, and all the reports that had been filed, both in connection with various litigation, running through many years; in fact all the data that could be secured, of a financial or engineering character. I did not attempt to make an appraisal of the property, except that I did secure some important evidence on the subject which I used in my report.

Q. And what purpose or conclusion was sought to be reached from the report, or because of the report?

A. The report was not made with respect to any pending litigation, but there was a great interest at that time in Chicago on the subject, because of legislation that was pending at Springfield, Illinois, with reference to giving street railways fifty year franchises and with reference to giving gas companies perpetual fran-

3641 chises, and of the right to keep out competitors by requiring every competitor should have the consent of the majority of property owners on every mile of street, and so the public interest in the matter led to the request, I suppose, for the report. Then I went to Kansas, to the State Agricultural College, as already mentioned, and there wrote a book on municipal monopolies, which was published by Crowell & Company in 1899. I wrote about half of the volume and edited the rest, giving full credit to the others who assisted. This book passed through four editions and is now out of print. It has been extensively used in the colleges of the country as a text book for graduate students, I am told by Professors of political investigation.

Q. What investigation was made and used by you in making up the material and matter for that publication?

A. Data, so far as I could get it, upon the question of investment, operating expenses, rates of charges, franchise values, suc-

cess or the opposite of municipal plants in this country. It attempted to treat on almost all the sides — public economists were interested with respect to municipal utilities. In the spring of 1899 I was called to Detroit on leave of absence from Kansas, to appraise the franchise values of the Detroit Street Railways for a Commission consisting of Governor Pingree, who was then mayor, I believe, yet he may have been Governor at that time, and two business men of the city. This commission was desirous of a valuation with reference to a possible municipal purchase, and the Street Railway Company agreed with the City to leave to me the valuation of the franchises. The question had never been undertaken before in that form, and this was the first valuation of a franchise ever made, as I know of, in this country. Some of the principles
I adopted were followed by Professor Henry C. Adams in
3642 his appraisals of franchise values for the Interstate Commerce Commission. Professor Cooley, of the State University, had charge of the physical valuations and I of the other; that was made first and then I was called on to discuss the question of franchise values. At that time some of them were about expired and some of them had many years to run yet, making it a very technical question as to what to do with it.

Q. How long were you engaged in that work?

A. Well, in the neighborhood of two months. I gave to it, not all the time in Detroit, some of it back in Kansas. The report I made was accepted by both sides, but the purchase fell through, owing to a decision of the State Supreme Court that under the constitution the state could not have municipal ownership of street railways.

Q. That was a pioneer case in the state of Michigan?

A. Yes, sir. Since then the law has been changed. Immediately afterwards I went to New York and opened an office for a sort of a clearing house on municipal matters, particularly public utility questions. I called it Bureau of Economic Research, and there were two other men prominently identified with it, Professor John W. Commons, now of the University of Wisconsin, and Mr. George H. Shibley, largely at the head of the direct legislation movement to-day in the city of Washington. The chief supporters of the movement were Mr. Shibley, myself, and Mr. R. Fulton Cutting, leading citizens of New York, and Tom L. Johnson of Cleveland, the present Mayor Gaynor, of New York, B. Everett Macey, head of one of the largest gas companies to-day on Long Island, and some few others. It was the precursor of the present bureau of
recent research of New York City which has been carried
3643 on by Mr. Cutting and others recently. While I was in the
work, the United States Government asked me to go to Europe to study technical education in Great Britain, and I spent the summer of 1900 in that work in Great Britain for the United States Department of Labor. The report was published in a large volume, devoted to technical education throughout Europe. I had the British portion. While there, I took occasion, in all the cities I visited, to get acquainted with the managers of public utilities,

street railways, water enterprises, electric light and gas, getting all the information I could. I was favored in this by Mr. Livecy, at that time a recognized authority on gas and at present connected with one of the largest London companies. In connection with the work of the Bureau in New York, during the years 1900 and 1901, I was employed by the City of Haverhill, Massachusetts and Springfield, Massachusetts, in gas cases before the Massachusetts Gas Commission, and was the only one they did employ outside of the attorneys.

Q. What did that investigation include and cover?

A. The question of reasonable rates.

Q. What other questions were necessarily involved in that?

A. The question of their profits, the question of the reasonableness of the profits, the question of operating expenses, the value of the plant, and everything connected with it. In both cases the Commission gave a decision favorable to the city. In 1901, in the spring, Mr. Johnson was elected Mayor of Cleveland and urged me to come to help him——

Q. That was Tom L. Johnson?

A. Tom L. Johnson. I had for a few months in the early spring been at Columbus, Ohio, in an investigation of the
3644 street railways of that city, having been invited to do that by a paper, the Press-Post, at that time of Columbus, at their special request, and by Rev. Washington Gladden, an old friend of mine. Then Mayor Johnson asked me to come to Cleveland and assist, in fact take charge of representing the City's interest in the appraisal of the street railway and electric light and gas companies of Cleveland before the taxing boards, and to represent the City also in the assessment of steam railroads of the State of Ohio, because of the fact that the cities obtained a portion of the revenue of the state tax, they were interested in a proper assessment. I did that for a while, for several months, and issued a report on the subject of steam railroad assessments.

Q. With respect to these several public utilities, this investigation or examination covered and included what part of the business of the operation of these companies?

A. Those investigations very largely included a careful study of their reports, everything that the financial journals gave, and the engineering journals gave about them; and they were obliged to submit to cross examination, or examination before the taxing boards in which I sometimes helped, with regard to the valuation of their property, or improvements during the year.

Q. Covering operating expenses?

A. Yes.

Q. And cost of operating?

A. Yes, and their renewals, maintenance, depreciation, all these items had to be taken up. Then Mr. Johnson urged me to leave the Bureau in New York and take charge for him of the water department of Cleveland. He was one of the supporters of the Bureau in New York. After consulting with Mr. Cutting and others
3645 of his associates, it developed that Professor Commons had a flattering offer also, and Mr. Shibley had very important

work he wanted to do, and it seemed perhaps well for us to accept these various new fields of work and discontinue the New York office. So I went to Cleveland and took charge of the water department about the 20th of September, 1901.

Q. Now, give us a statement as to the scope of that water department, what it was and how large a field it covered, and what you did with respect to it.

A. I was in charge from September, 1901, until the end of December 1909, somewhat over eight years. The department had a physical value that was carefully appraised, not only by our own men but by a Mr. —— the head of the Peoria Water Company, I have forgotten his name—who was a prominent engineer of a private water company. I recall now his name is Dabney H. Mowry, and acting in behalf of a national organization, organized to investigate municipal and private plants on a nonpartisan basis, that appraisal showed the physical property, without any allowance for anything except the investment cost was over 11 million dollars. During the time I was there we put in more miles of street mains than all the street mains of the Gas Company of Des Moines, and averaging much larger in size for we had many mains 36 and 42 inches, a good deal of 30 inch. We had occasion to build a large pumping station at a cost of over a million dollars. The contractor had failed in an attempt to give us pure water by building a tunnel nine feet interior diameter, five miles under Lake Erie, and we took hold and finished the job directly, the Water Department. The work that I took special pride in was the metering of the city.

Q. I wish you would explain that?

3646 A. Hitherto there had been no universal metering of large municipal water works in this country. From my studies of the gas question, I was convinced that it was very desirable to know accurately the measurements of all quantities sent out and used, and the result was that I undertook what was said to be an impossible job in a municipal plant, to meter everything and make it popular while you were doing it and get the support of the city council in the process. For a while there was opposition, but with the support of the Mayor during the critical period it was finally carried through to a successful determination and it became so popular that appropriations for it were given unanimously during the last few years. I put in more water meters than ever had been put in up to this time by any man in America—put in over 70,000 and reduced the per capita consumption about one half in Cleveland.

Q. That resulted in saving about one half of the water used to the consumer?

A. Yes, sir; at the same time everybody had all the water they wanted; simply the waste was stopped, and the plumbing leaks. Then I took great interest in introducing accounting reforms and helped the Mayor a great deal in the Street Railway controversy that was going on, which finally resulted in a settlement by Judge Taylor in the United States District Court. In fact I devoted a large amount of time to that work the last five years I was there. I also represented the City in the negotiations frequently carried on

as to the natural gas and artificial gas companies of Cleveland. Natural gas was introduced while I was there. I helped write the ordinance which was passed.

Q. During that nine years, or eight years, of your service with the City, how much of the field of the operations of the
3647 water plant did you personally cover?

A. I visited frequently all the branches of the work from the laying of the mains and services and meters and construction of the pumping stations; they had three stations; but I devoted my special attention to the financial results and accounting end.

Q. How much attention if any, did you give to the question of increasing the efficiency of the apparatus and the economy of operations?

A. I devoted a great deal — attention to the economy of operation and efficiency and believed that the work could be made, what I think it was recognized as being towards the close, quite on a par with any water works, public or private.

Q. Was this a municipally owned plant?

A. Yes.

Q. Belonged to the city?

A. Yes. I took special pains to seeing that it could be as well managed as the U. G. I. managed its gas works and their other plants and took a great deal of pride trying to do it. Then I had some gas investigations on yet outside of Cleveland.

Q. Tell us about that.

A. I was employed in gas cases by the cities of Saginaw, Cedar Rapids, Lincoln, Syracuse, Buffalo, in rate cases, and by Boston and New York. I did some work on a gas tax case for the city of Baltimore. I did a large amount of work for Boston and an amount of work equal to an equivalent of a year for the city of New York while I was in Cleveland during the four year controversy. I used to get a leave of absence for two or three weeks and go to New York a week or two at a time. Professor Marks and I were the only men employed continuously, first by the old State Gas Commissions, to the final preparation of the briefs for the United States
3648 Supreme Court.

Q. In these several cities which you named, leaving Boston and New York for the moment, were they all rate cases?

A. Yes.

Q. And involved what sort of investigation and examination?

A. An examination of the books of the company so far as possible; the preparation of information called for by the cities, which I generally helped prepare; furnishing such data as I thought ought to be called for; it consisted in engineering investigation so far as it could be made. I did not attempt to do a great deal of engineering work, except sometimes in the matter of the distribution system. Of course, I had accumulated more or less information on all phases.

Q. Your engineering experience, however, is entirely field work?

A. Yes; I never claimed to be a gas engineer.

Q. You claim no technical knowledge?

A. No technical knowledge, but I had a very large amount of data available as time went on. Of course the distribution system problems were very analagous to those I was handling in Cleveland.

Q. And during the Cleveland experience I suppose you had something to do with the engineering and water end during all those years?

A. I suppose there is no industrial plant like water or electric light, revenue producing plant of any large city in the country in which the head of it was so completely the monarch as I was. I ignored politics entirely; boasted that I had no politics; I didn't recognize the politics of anybody that I appointed or removed among the 900 employes. And I had to do with the general policies of the pipe-laying and constructing of the reservoirs and
3649 and the location of the improvements, more or less.

Q. And the soil?

A. The questions of where pressure needed to be improved and what should be done for it. Of course, I called for engineering reports all along the line constantly, and frequently called in experts from other cities.

Q. Now, then, barring Boston and New York for the moment, what if anything was involved in these cases in the way of ascertaining the cost of manufacture in a general way, operating expenses, and the construction cost of the property and all that sort of thing?

A. Always the attempt was made to get all that information.

Q. Now in Boston, I wish you would tell us what that work involved there, give us a good, broad description?

Mr. GUERNSEY: Let us have the date.

A. My recollection of it is it was 1905. The people of the city of Boston were paying a dollar for gas. The attempt was made to secure a reduction. The hearings were before the State Gas Commission and lasted for many weeks. There was some engineering data furnished by others and I analyzed the accounts and reports of the companies that had been made for years; that company and other plants in the state to the State Commission. It resulted in the Company claiming they could not possibly sell gas at hardly anything below a dollar, but the matter was thrown into the legislature and resulted finally in the adoption of a sliding scale under which within two years the Company was furnishing gas at the price of eighty cents, which was what we were asking for before the commission.

Q. How much is the field covered by you during that investigation, the part that you put in most of your time on?

3650 A. The time I devoted on the subject was mostly in an analysis of the reports for a great many years, not only the Boston company, but there was several companies—Dorchester, Roxbury, the old Boston company, the Bay State and two or three others, Brooklyne; they all had their own systems and reports to the State Commission, and I compared them and analyzed them in connection with the reports of the other larger Massachusetts cities, such as Lowell, Lynn, Lawrence, Fall River, Cambridge etc.

Q. During these hearings, what if anything did you do in the way of being present and hearing the reports and testimony and evidence as to the valuation of apparatus and the distribution system and all that sort of thing?

A. Oh, yes; I was present during nearly all of the hearings and it was my duty to read all the evidence during the days I was not there. I was given an opportunity to visit all the works and plants as far as I had time to do.

Q. And examined the testimony of the engineers and other persons who placed valuations upon apparatus and so on?

A. Yes.

Q. In the New York matter, I wish you would give us more of a detail of what you did there

A. The state legislature, acting on the advice of Mr. Hughes, I think he had become Governor at the time, had passed an 80 cent gas ordinance; but the matter came up for further investigation before the State Gas Commission, and I think on their recommendations the law was going to be revised perhaps it had not been passed at all; I am not quite sure as to that. The State Gas Commission heard the testimony for three or four months and made
3651 their report. Then the law went into effect fixing absolutely 80 cent gas for private consumers, and 75 cents for city, public use. Then an injunction was issued by Judge Lacomb of the United States Court and a Master appointed to hear the testimony as to whether the rate was confiscatory or not. So the case again came up before Mr. Arthur H. Masten, who was the Master, and those hearings lasted through a good share of 1906, and part of 1907, and his report was followed by briefs and arguments by counsel before Judge Huff, who reviewed and reversed in some respects the Master's opinion, and then further briefs were prepared taking the case to the Supreme Court. I assisted in the preparation of the briefs, the facts of the case, but all the work previously had consisted in attending the hearing and testifying for twelve or fourteen days on the witness stand and in studying the testimony and getting all the data available on the cost of construction and operation and comparing with the other gas companies, New York, Brooklyn, Boston, Chicago, and wherever data could be secured. Very much as had been done in the other cases.

Q. During that time were you in touch with the men who were making up the inventory of the property and the physical valuation of the property?

A. Yes.

Q. And heard their testimony?

A. Yes.

Q. And read it?

A. Yes.

Q. Analyzed it?

A. Yes.

Q. Now, down to the end of your service at Cleveland——

3652 A. There is one matter I omitted. I might say, I probably omitted several cities with which I have been identified. I

recall for example, I was engaged by Montreal to make a report on municipal gas works; they had some idea of establishing, which they never did.

Q. Did you put in some time in making that report?

A. Yes.

Q. What did your report include?

A. It covered the items of cost, both construction and operation; but the conditions were very difficult in Montreal, for the reason that the pipe had to be buried very deep on account of frost and there was rock there.

Q. To make up the report for the city of Montreal, what if anything did you do for the purpose of informing yourself, in addition to the general information that you had secured from all these former hearings?

A. Applying the unit costs to holders I thought necessary; to the coal gas and water gas plants; to the sizes of the mains; to the meters and services which I had thought necessary to cover the entire city.

Q. From what sources did you get all this information, that is the information that you thought was sufficient upon which you were willing to rest your judgment and make a report?

A. I got it from the accumulated data in the many cases I had been in, not only that, but I had access to all the data filed from time to time by every gas company in Massachusetts with the State Gas Commision. Whenever they wanted to issue stock or bonds they would have to put in all the extensions they made.

Q. Is that information helpful?

3653 A. Very helpful. Of course I had no data with conditions as they were in Montreal and I made a large allowance.

Q. Of course, I assume there were some conditions involved in Montreal that were local and peculiar to that place?

A. Yes.

Q. What if any examination and investigation did you make?

A. I visited the city and had a long conference with the city engineer, went over the territory some with one or two other engineers connected with the city, so as to get all the data I possibly could and the character of the soil and the conditions of the city generally.

Q. And the cost of labor and material?

A. Yes.

Q. And the character of the country or city in which the plant was?

A. I also paid a good deal of attention to the character of the administration, how efficiently or inefficiently they were doing their lines of work.

Q. In other words, you covered the entire field you thought necessary to make up an intelligent report for the purpose of advising the city as to whether or not it should go into the enterprise?

A. Yes. Then during the same period the National Civic Federation desired to have an investigation of the relative conditions of

municipal and private management of all public utilities in this country and Great Britian——

Q. What National Civic League was that?

A. The National Civic Federation of which Senator Hanna for a long time was president and Seth Lowe and I think August Belmont was president at the time this work was undertaken. The Secretary
of it was Mr. Easley, formerly of Kansas, and for many
3654 years in Chicago and New York. A large fund was raised, about $100,000 for the investigation and a committee of about twenty-one members——

Q. I wish you would name the committee?

A. It was some time ago and I shall probably omit many, but Mr Ingalls, President of the Big Four Railroad, was head of the Commission. Mr. Walton Clark of the United Gas Improvement Company was a member; Mr. Egdar, President of the Boston Edison Electric Light Company; another Mr. Clark, William G., I think; John Ferrán, Sales Agent of the General Electric at that time—I am not sure what position he holds now; Professor John R. Commons, I mentioned before, of the University of Wisconsin at present; Professor John H. Gray, of the University of Minnesota.

Q. Was Lewis Lilley on the committee?

A. No. And Professor Goodnough of Columbia University.

Q. Marwick Mitchell?

A. No. There were four or five men connected with labor organizations on the committee.

Q. You were a member of the committee?

A. I was a member of the committee. Then there was Mr. Winchester, head of the Municipal Electric Light plant of South Norwalk, Connecticut. A sub-committee was formed by the full committee, of five members.

Q. Who were they?

A. Mr. Walton Clark, Professor Goodnough, Dr. Milo Maltby, now one of the members of the Public Service Commission of New York City, First District, they call it; and a labor member, Sullivan, and myself, and we constituted the committee until at one time through one illness of one of the members, I believe Mr. Edgar
for a while was on the committee. We were the executive
3655 committee that carried on the investigation and employed the experts.

Q. What was the investigation; what did you do?

A. We had an engineer connected with private plants and an engineer connected with the municipal plants to go together and investigate the character of municipal gas works and private gas works, selected ones in this country; the same of electric light, and the same of water. We did not touch street railways in this country. In Great Britain we did include street railways, but did not include water; we included street railways, gas and electric light. We also agreed on an accountant. Marwick-Mitchell & Company was employed to do all the accounting in this country. In Great Britain another firm was employed and other engineers in Great Britain avoid expense. We had appraisals made of properties and we went

into their accounts fully and made an exhaustive report in over three volumes. After the general report of only two or three pages was adopted by a vote of about 20 to 1, then the evidence was summed up more fully from the municipal side and private side by five men—Maltby, Parsons and myself summarized the public side and Mr. Walton Clark and Mr. Edgar, and I think somebody else some of the time assisting, summarized on the private side. I should have stated, on this commission was Mr. Walter Fisher of Chicago, very prominent, now Secretary of the Interior. He did not go to Europe with us but took a very active part in all the meetings in this country. There were fifteen of the twenty-one of us went to Europe.

Q. How long were you over there?

A. About three months.

Q. What did you do, if anything, in the way of personally going over the field with the experts?

3656 A. We did that in this country and Europe. We visited every plant together as a commission, and the sub-committee of five made visits that the general committee did not make, constantly studying the work.

Q. The report of that work is bound in three volumes, and what is it called?

A. I forget the exact title, but it is probably called Public Utilities or Municipal Ownership or something like that, of the Investigation by the National Civic Federation.

Q. Is that the three volumes I have here on the table a week or so ago?

A. I think you got that from Mr. Hall, perhaps.

Q. Now, have you had any other employment covering this same field that you can now think of and have not mentioned, if so, I would be glad for you to do so before we start on this plant?

A. Perhaps I should say that in December, 1909, when Mr. Gaynor was elected Mayor of New York, whom I had known for some years, he wanted me to come to New York to put in effect the same policies in the Water Department I had carried out in Cleveland. I understood this to mean movement towards the universal metering and having meters and services put it and owned by the city, with city labor, and introducing other economies, and accounting methods and so on. I went to New York with that idea and found very soon great antagonism in the department and outside of it; the meters all privately owned; they were soldered into place; they had not been tested since they were put in; many of them had been in twenty or thirty years; they were all put in and repaired by private plumbers at enormous charges, and in general matters were about in as

3657 chaotic a state as possible; prices for meters generally were so high, about two-thirds more than any individual could buy a meter for in any other city in the United States. I started in to change that and we was making considerable progress, despite the opposition, until the Mayor was shot. Then my support was falling off. The interests that didn't like this work insisted on my leaving, and I did not care to resign and insisted I would not resign unless I

could first see the Mayor and I thought I would be able to as he was gradually gaining in strength.

Q. Now, next after that, did you have some further employment with some large cities?

A. Yes, I left the department then at the end of October, 1910.

Q. In New York City?

A. Yes, I was Deputy Commissioner of the Department of Water Supply, gas and electricity. Then after leaving the Department at the close of October, I did considerable writing for engineering journals and was engaged by the City of Toledo to take charge, represent the City in the entire charge of the appraisal of the street railways of Toledo, and began work on it. But the company insisted that they had no objection to my representing the city but they thought there should be a third man chosen as an arbitrator and the city refused to do that at first, but finally insisted that all questions of dispute should be threshed out between the Mayor and President Lange of the street Railway, as it had been in Cleveland between the Mayor and the President of the Street Railway Company there. Finally, however, the City said that they would recommend Judge Killis of the United States District Court, living at Toledo, as the third arbitrator. The Company said, no there must be a street rail-
3658 way expert, and the case has hung fire ever since, the City refusing to go on. I was engaged in Chicago about the same time to investigate the Peoples Gas Light & Coke Company with respect to what should be a reasonable price for gas.

Q. That is still on?

A. Yes, I made a report, and the council took action following very largely the recommendations of the report, and then it was taken into court and is still pending.

Q. That is the ordinance by which the price of gas was fixed at 75 cents for the first two years?

A. 75 cents for the first year and 70 cents for the next two years and 68 cents for the last two of the five years. Following that report I was engaged to take charge for the City of Chicago of a report, telephone reports, which I am engaged in now.

Q. That you are at work on now?

A. Yes.

Q. That Chicago gas situation, as I understand it, the Gas Company now is furnishing gas under the order of Judge Gibbons at 80 cents?

A. Yes.

Q. The price before the passage of the ordinance based to some extent on your report was how much?

A. 85 cents. I forgot to say when that price was fixed five years before, in 1906, or December 1905, and January 1906, I was called in by the City and advised with it in regard to the matter at the special request of Mayor Dunne. The price was a dollar at that time and was reduced to 85 cents.

Q. There was an abrupt reduction of 15 cents?

A. Yes; the council was considering a larger reduction.
3659 The Company has some claims against the City for lights, I believe furnished for the streets, etc., which had been a large question of litigation for some time, and other questions were at issue. Finally a compromise was reached by which the whole matter was settled and for five years the price fixed at 85 cents.

Q. When did that five year period expire?

A. It expired, as I recall, about the middle or some time in the spring of this year.

Q. Anyway, before the passage of this last ordinance?

A. Yes, either the spring of this year or some time near the latter part of last year.

Q. Did you have anything to do with the adjustment of the traction difficulties in Chicago?

A. No, I was not engaged on that.

Q. And this work that involved the charge of the Chicago Peoples Gas Light & Coke Company, was your field about the same for your investigation and examination, about the same as in these other cities you have already told about, or was it limited?

A. It was far more limited, because I had not access to the books and records of the company. But I have at various times had Occasion to go quite fully into certain phases of the financial history of the Chicago companies, running back to the first gas company in 1894, following the various sworn statements they made from time to time in the courts and other places in connection with litigation and reports made public and to their own stockholders, etc.

Q. In all these years you covered so far in your testimony have you devoted any time to the examination and investigation of financial matters that involved the selling prices and quoting prices of bonds, stock and other securities?

3660 A. Yes, I have had occasion to devote a great deal of attention to that.

Q. In a general way, tell us about your experience?

A. I have had occasion to follow the weekly quotations and daily, and more often though weekly and monthly summaries in the Commercial and Financial Chronicle of New York for the last 25 years; perhaps more fully the last 15 years.

Q. How broad a field does that Chronicle cover?

A. It covers all the securities listed in any big stock exchanges of the country. Also includes reports of the companies and listings of the stocks for exchange wherever they have to make sworn statements of that condition. I did not mean to confine my suggestion of sources to that alone. Of course there is a great deal which appears in the technical gas journals.

Q. Have you devoted some time and attention to those?

A. Yes.

Q. How much?

A. I tried to keep in touch with the Progressive Age particularly, which I have taken for twenty years or more, since way back in 1890, and I get a good many English reports every month.

Q. How old are you, Professor?

A. I was fifty-one last April.

Q. Now, in your work, what do you have to say, as to whether you have devoted time and attention to informing yourself right along as to the prices of the materials and apparatus, etc. that is involved in and used by these public service corporations you have been testifying about?

A. I have devoted a good deal of attention to gathering such data. I have not used very much of it, however, in my report, as that was being covered in other ways and I have not had time to
3661 utilize most of it.

Q. Now, you know something about the Des Moines Gas plant?

A. Yes.

Q. As I understand you up to this point in your testimony, your first acquaintance with the property, or part of it was in 1892?

A. Yes.

Q. Now, at that time, did you have occasion to examine the statements of the officers of the Company as to valuation investment and operating costs and so on?

A. Yes.

Q. And did you hear any evidence or testimony that was given in that case?

A. I heard a little of it, I believe, and I have read all of it since I came here.

Q. Then your next acquaintance with the gas plant here, if I understand your testimony up to date, was in 1894?

A. The hearings were in 1894 or 1895; I thought most of them were in 1895, in the spring.

Q. Anyhow, in 1894 or '95.

A. Yes. It was in connection with that case that I have read more evidence than in connection with the 1892 case. I find very little now bearing on the 1892 case on the flood below, except a few affidavits.

Q. Was Mr. Walton Clark a witness in one of those cases?

A. Yes, he was in the 1892 case and the 1895 case too.

Q. And Col. E. C. Pratt?

A. I think he was in both cases.

Q. Mr. Lewis Lilley?

A. He was in the second case; whether he was in the 1892
3662 case, I don't know.

Q. Have you devoted some time and attention to the Des Moines gas plant recently?

A. I have, yes.

Q. When were you first interviewed with respect to any employment that involved the Des Moines gas plant and by whom?

A. A letter came to me in New York, I think from Mr. Brennan, the first I heard there was a case, I think it was early in the year.

Q. Early what year?

A. Early this year, asking me if I would help or come out and serve the city in the case.

Q. And when did you first respond with your presence here, if you did respond in that way to that letter?

A. Well, the testimony had been going on about a week or two, I should think, somewhere in the neighborhood of the 20th of July perhaps. As soon as I could get away from the Chicago case I came here.

Q. Was that your first visit to Des Moines following your experience here in 1892 and 1894?

A. Yes.

Q. You think it was about the 20th of July?

A. I think it was.

Q. You say some testimony had been taken when you came here?

A. Yes.

Q. Anything other than the testimony covering the real estate?

A. Very little. I know that neither Mr. Lea nor Mr. Baehr, nor Randolph had testified, but I think Mr. Haines had testified and some experts on real estate. Mr. Moul, I think, was on the witness stand when I came into court.

Q. Mr. Moul was one of the men at the works, either foreman or in charge of some department at the works?

3663

A. I won't undertake to say what his position is.

Q. He was testifying about the distribution system?

A. Yes.

Q. Were you present during the taking of the testimony of Mr. Lea, Mr. Baehr, Mr. Hagenah and Mr. Randolph?

A. Yes, during nearly all of it, not perhaps every day, but nearly every day.

Q. I wish you would tell the Master in your own way just what efforts you made to inform yourself and qualify yourself to testify with respect to the operations of the Des Moines gas plant and cost of its property and the price at which gas can be manufactured here in Des Moines and delivered to the consumer, and so on; state in a general way how you have covered the field since the 20th of July, without going into the report?

A. Aside from one visit to the works to get some general idea of the situation there and following some studies I had made of the inventory, blue prints and maps, and aside from several trips around the city getting the lay of the land, I devoted most of my time to a study of the exhibits and testimony and gathering further data that I thought illustrative of the situation here.

Q. Now, you referred to the inventory, that document has been marked in this case Complainant's Exhibit 15, did you look that over?

A. Yes.

Q. Who had it when you first examined it?

A. I did not look it over with the care that I looked over and specially studied the summary that Mr. Lea and Mr. Baehr used in their evidence.

3664

Q. But you did look it over?

A. Oh, yes.

Q. And Exhibit 15, was the part of the inventory that covered the

items of property and there is another exhibit, Exhibit 16 which contains certain sheets and photographs and other information with respect to the plant?

A. Yes.

Q. Now in looking over the inventory as it was prepared by the complainant, did you observe anything about it that indicated any unusual situation with respect to any part of the property? What I mean by that, whether there was anything about the inventory that indicated different conditions here with respect to the gas property than is observable generally in gas properties of this character and towns of this size?

A. No, the only thing I specially missed in it was any attempt to inventory the Valley Junction property; but aside from that I did not see anything in the inventory that I thought at all out of the ordinary.

Q. You did, however, did you not, observe either from the inventory or some other papers or records you found that the Des Moines plant was serving a plant outside of the city?

A. Yes, that was in the testimony.

Q. Aside from that, there was nothing that indicated it was necessary to make any special study of the apparatus or works or distribution system or anything of that kind?

A. That is right. There appeared to be no dispute in regard to the inventory and no particular controversy as to its omitting anything and it was a pretty complete and good inventory.

Q. There was nothing about Exhibit 16, the maps and
3665 sketches and photographs that indicated any unusual or extraordinary conditions with respect to soil or the lay of the land or any thing of that kind?

A. No, I watched particularly the testimony and exhibits and other data to see whether there were exceptional difficulties in laying mains here or foundations for buildings and I didn't discover there were.

Q. Now, in addition to the examination that you made of the inventory as furnished by the Company, I wish you would state in a general way now how you devoted your time since with respect to the record in order to inform yourself fully as to the situation?

A. Why, I have made special study, first of the exhibits and of the testimony, and then I have studied the stock and bond quotations I refer to in my report. Also the Massachusetts experience of several cities seemed to be comparable in a measure with the situation here, and have drawn on my previous studies. I may say I have neglected one line of investigation which I forgot to mention and that is, the study of the rate decisions and rulings of commissions and courts on rate cases. Of course, I have not been admitted to the bar, but have had occasion during the last fifteen years to follow up the studies of constitutional law, or at least constitutional history in its various forms and to go right into the decisions and rate case decisions. I suppose I have read most of those decisions, both with respect to steam railroads and municipal utilities for a good many years.

Q. What have you done—for instance, we will start with Mr. Lea's testimony and Mr. Lea's report—have you examined or thoroughly analyzed it?

3666 A. Yes.

Q. What have you done in the way of reading what testimony has been given here that you did not hear from the witness?

A. I have endeavored to do that and I think I have done so, except perhaps the last two days I have been so busy I have not read much or known much of what has occurred; other than that I have kept pretty well posted.

Q. The testimony largely the last few days of the hearing was given by Mr. Sangster and covered the details that were furnished to Mr. Hall for the purpose of making up his tabulation and report. Now, Mr. Baehr, have you analyzed his report and read his testimony?

A. Yes.

Q. Examined the tables and schedules furnished by him?

A. Yes.

Q. And Mr. Randolph's?

A. Yes.

Q. Gone over his testimony carefully?

A. Yes.

Q. And his report carefully?

A. Yes.

Q. Examined all the tables and schedules and comparisons that were made?

A. Yes.

Q. And Mr. Hagenah, have you gone over his work carefully?

A. Yes.

Q. And informed yourself with respect to the theory upon which his conclusions were worked out and finally reduced to typewriting?

A. Yes.

Q. And the same is true as to Mr. Baehr's and Lea's theory

3667 of arriving at valuations, have you gone over that carefully?

A. Yes; and I know Mr. Alvord very well and talked with him in months past; he has been called the parrot of the theory of going value sometimes.

Q. He is not in this case.

A. No.

Q. I am referring particularly to the men who have appeared here. What have you done to inform yourself of the prices of material so far as possible?

A. I have tried to inform myself to some extent on that, more particularly with regard to the distribution system.

Q. Which involved the cast iron pipe, the laying and ditching and specials?

A. Yes.

Q. And the paving question and all that sort of thing?

A. Yes, but I have not studied the paving very carefully.

Q. What have you done, if anything, in the way of going over the records and books of the Company, either in their original form or abstracts from them or reports made up from the books?

A. I have specially interested myself in that; everything in Mr. Hall's exhibits and testimony for example, and wherever data was given by the witnesses for the Company on these lines, I followed them.

Q. Have you fully informed yourself as to the facts that are set out in Mr. Hall's report?

A. Well, I have not gone back of his report to the vouchers at all, but I have assumed that his report was correct.

Q. You examined the report carefully?

A. Yes.

Q. And checked it up?

3668 A. Yes.

Q. Now at any time since you came here have you made an investigation to ascertain just the beginning of the Des Moines Gas plant, that is, how it was acquired first by the old Des Moines Gas Company?

A. Yes.

Q. And where did you find the information with respect to that?

A. In the testimony by the witnesses for the Company in 1895, and particularly by Mr. Lilley the accountant of the Company, and now I believe secretary.

Q. What was he then?

A. He said at that time he was employed by the United Gas Improvement Company to come out here and spend a few weeks studying their accounts and history for the purpose of testifying.

Q. That is, he was an accountant?

A. Yes.

Q. You said he was now secretary, I think he is treasurer?

A. Treasurer, yes.

Q. Did you find from an examination of the records here anywhere just how this property came into the possession of the old Des Moines Gas Company?

A. Yes, and I should have added to the answer to your previous question, from the testimony also of Mr. Pratt at the same time.

Q. Col. E. G. Pratt?

A. And other witnesses, Mr. Clark.

Q. How did you find the property was acquired in the first place?

Objected to on part of the complainant as being hearsay, secondary and incompetent. The copies of the testimony of these witnesses themselves would not be competent in this case and much less are the inferences drawn by witness from the copies of this testimony.

3669 A. It was bought, according to Mr. Lilly, at sheriff's sale for about $38,000 in about 1876, a little before the first closing of the books of the Capital City Gas Light Company, January 26, 1878.

Q. Did you get that information when you were here before also or at this time?

A. I don't remember whether I did before or not.

Q. That purchase at $38,000 at sheriff's sale as you found it from the examination of the records was just preceding the closing of the books in the year 1878?

A. The year ending January 26, 1878.

Q. Have you so far as it was possible for you to do in the time followed the history of the Company from that time down to this and noted the transfers and changes in at least the name of the owner?

A. Yes.

Q. How much time have you devoted to this work, Professor?

A. When I have been in the city, all my time. When I was in Chicago probably half of my time during the interim here of a couple of weeks.

Q. How much of the time during the early part of this trial, in the long ago, were you in touch with Professor Marks while he was making up his report of the valuation of the physical property?

A. I had not seen him or had no information about his work during the weeks that he was here, three or four weeks, or all the time in fact that he was here prior to my arrival about the 20th of July, or thereabouts.

Q. When did you first have an opportunity to examine Professor Marks' report?

3670 A. When he had reached his total of $1,700,000 he called me into his room and he said he had something interesting he wanted to show me and he showed me that table just in the form it appears on page 75 of his report; that portion of the page which contains two columns of figures, but I never did see or care to see or had time to see his detailed appraisals until after he had begun to testify.

Q. Then you were furnished with a complete copy of his report and what do you have to say as to what you have done in the way of studying that report carefully and verifying it in so far as it was possible, his conclusions?

A. I have heard all the testimony I think that he gave, both direct and cross, except possibly the last day and that I read and I went through his exhibits more or less, and I have had occasion to refer to it a few times in connection with the report that is here.

Q. And after the report was delivered to you and you had an opportunity to examine it, what if any talk did you have with professor Marks during the days that he was being examined, and other witnesses being examined, with respect to prices of materials and labor as he had worked them out here?

A. I don't remember any concrete figures. I asked him how he had secured his figures of prices.

Q. That is what I wanted to know. You were informed with respect to the manner in which he ascertained the information in regard to local prices?

A. Yes, I particularly asked him about that, and in a measure he told me, but I do not suppose he told me some things he did on the witness stand afterwards.

Complainant moves to strike the answer as being hearsay
3671 and incompetent.

Mr. BYERS: Yes, that may go out.

Q. Now, Professor Bemis, during the time that you have been going over the situation here at Des Moines, I wish you would state

what your purpose was in all the work that you have carried on here, what you were trying to ascertain?

A. What the facts were as closely as I could learn them, as to the cost of investment, the cost of duplication on the basis of recent extensions, of the earnings, the questions raised in the trial, the depreciation, the overhead charges, going value, etc.

Q. Investment value?

A. Yes.

Q. Investment in the property and business?

A. Yes, land and paving, duplication, costs.

Q. And for the purpose of finally determining what question, in so far as it was possible to do?

A. Determining the probable effect of the ordinance passed last December.

Q. Reducing the price of gas to 90 cents?

A. Yes.

At this time an adjournment was taken until 1:30 P. M.

3672 1:30 P. M., WEDNESDAY, *September* 20, 1911.

EDWARD W. BEMIS being continued on direct examination by Hon. H. W. Byers, testified as follows:

Q. Prof. Bemis have you reduced your calculations and findings to writing?

A. Yes, sir.

Q. What do you say as to whether or not you have made up a complete report covering the investigation of the matters about which you have been so far interrogated?

A. So far as I have had time to do.

Q. Do you have a copy of your report and conclusions?

A. Yes, sir.

Q. I wish you would hand the original copy to the reporter and have him mark it as defendant's exhibit No. 43.

(Report here marked defendant's Exhibit No. 43.)

Q. I wish you would state first in a general way the several heads or subheads you use in making up your report?

A. Well as shown by the index at the beginning, I take up the cost of the property first. The amounts that should be allowed for depreciation. The net investment after deducting the depreciation. The working capital. The amount inclusive of the working capital. I discuss the question of overhead charges, discount on bonds, rise in the value of the land, the question of paving over the mains. The question of going value and claims for appreciation, then the matter of operations, the cost of reconstruction as shown by the books, the investment theory versus the question of duplication and the
3673 facts as shown by the books of the company, by the books of the company and by Prof. Marks' testimony. Then I take up the question of operating expenses, manufacturing or in the holder, putting gas in the holder, the question then of leakage in connection with it or unaccounted for gas, then the other operating

expenses such as distribution and general new business, etc., donations, bad debts and the question of increased cost of collection by virtue of not having any penalty, the rate litigation expense and what should be done with it, taxes, the abnormal character of the operating expenses, particularly distribution and general in 1910 indicating that it is fairer to take the previous four or five or six years. Profits at 90 cents, what they would be on a basis that I use in the previous part of the report, what rate of return is necessary to secure stocks and bonds at part in a city situated like Des Moines, Qrospects of future growth and the bearing of these prospects on costs and profits. Finally gives some experience from Massachusetts relative to some of these points.

Q. Now taking this exhibit up more in detail, beginning with your report on page 6, I wish you would cover the matter that is included in page- 6 and 7, as briefly as you can and still give a fair explanation of it?

A. One method of determining the cost of the property I thought to be the cost to the present company, the Des Moines Gas Company, as shown by what they paid for it March 1, 1906, together with increase of surplus since then.

Q. How did you work that out?

A. The evidence shows——

Mr. GUERNSEY: We object to this testimony in the first place as irrelevant, immaterial because value and not cost is the ma-
3674 terial question and next because it is purely argumentative and quoting from the testimony of other witnesses and not the expression of any opinion or statement of any fact by this witness, but as an argument under oath.

Q. Go ahead Professor.

A. It shows that the Des Moines Gas Company on the first of March 1906 assumed outstanding bonds of $400,000 of the Capital City Gas Company and a debt of $240,000 to the parent company, the United Gas Improvement Company for property in the city of Des Moines, and also a debt of $45,000 for property at Valley Junction. Aside from the holder and the amount at Valley Junction the bonds were $640,000, these were five per cent bonds, then there were preferred stock contracts of $800,000 paying six per cent which were issued at the time of purchase by the Des Moines Gas Company and that total of the two is $1,440,000 of interest bearing securities. Then the $2,250,000 common stock issued but that has never paid a dividend and the stock that it displaced $600,000 of the Capital City Gas Company had paid very little in the line of dividends, consequently it is right to say that the payment that was really made was represented entirely it seemed to me by the interest bearing securities, bonds and preferred stock contracts. Now beginning with March 1, 1906, with $1,440,000 that was paid for the property there has been since in extensions $484,000 odd dollars, according to Mr. Hall's or defendant's Exhibit 30, page 21. This brings the total present cost of the property to the Des Moines Gas Company practically $1,925,000, less the depreciation of say $75,000 since the purchase of the property five years ago.

Q. Do you explain that item just at that point how you arrived at the $75,000?

3675 A. It is based on an amount substantially that I find it necessary in my later computations to put into a sinking fund covering three years.

Q. To take care of the depreciation of the property?

A. Yes. So that leaves in round numbers $1,850,000 as the cost of the property to the present company. That I do not accept as my theory as the value of the property, but it would appear to have been the view taken at the time by the Des Moines Gas Co.

Complainant moves to strike out the last statement commencing it would appear as a mere conclusion and incompetent on that account and also as contrary to the record that as a matter of fact has been introduced.

A. That I would have to take as to this $1,925,000 before the deduction of the $75,000 represents the securities as shown by the books as abstracted by Mr. Hall.

Objected to because it is not competent for one witness to testify as to the testimony of another witness, the testimony of the second witness being predicated upon some books of account that is as to the contents of the books.

A. From both the data introduced by Mr. Hall and also introduced by Mr. Hagenah I discover no conflict with regard to these figures. Apparently the only question I can see at issue would be whether that stock was supposed to represent any value, the common stock or non dividend securities.

Q. Now if you will, proceed and explain anything further that you care to with respect to these two pages.

A. I think that has been covered sufficiently.

Q. Now page 8 gives what plan?

A. I have divided that into four periods, the first preceding the year 1876, the second from that time until December 31,

3676 1894, third from that time until the change of the nominal ownership February 28th or March first as you may call it, 1906, the fourth period from March 1st, 1906, until the close of 1910. I see in my copy, I don't know whether it is just this one that it is until December 1, it should be of course December 31, 1910. If it is December 1st, it should be changed to December 31st, 1910.

Q. Go right ahead and explain how you arrive at that conclusion.

Mr. GUERNSEY: I want to object to the testimony set out commencing with the words "with respect to the first period which the witness is about to read, and which purports to be copies quoted from the testimony of witnesses in some other suit to which the complainant was not a party or to the statements of the results of the testimony there as being evidently incompetent as hearsay and secondary.

Q. Go ahead, I don't care to have you state anything more than is necessary to make your explanation clear.

COURT: Let it be understood that these objections apply to each and all testimony and each and every part thereof with the same force and effect as though made at the time.

Mr. GUERNSEY: I have no objection to that, of course we will have other objections to other parts of the testimony.

A. For the period prior to 1876 I have no evidence except the testimony of Mr. Lewis Lilley, the accountant of the United Gas Improvement Company at that time, now its treasurer, who testified under oath in 1895 as quoted here in substance that the property was brought at Sheriff's sale by the Capital City Gas Light Company for $38,828.36, a little before 1878. He testified that the first closing of the books was on January 26, 1878, and at that time the purchase had been made only a short time so the first period contains merely that reference to that purchase.

3677 Q. The second period, how did you work that out?

A. The second period from the time of that purchase until the close of 1894 is again based upo nthe testimony of Mr. Lilley where *e* he again refers to this $38,828.36. I see one copy is $39,000 it should be thirty eight in that second reference to it near the bottom of the page, Commencing with that purchase Mr. Lilley and Mr. Pratt give the amount that went into the property from that time until the close of 1894. They reach a figure given on page 10 of $466,532.93 as the total amount that had gone into the plant in cash by the close of 1894. They also refer to about $200,000 a little over that, that went into the plant in the shape of electric light property and water gas patents, or gas patents, I don't know as they were all water gas. Mr. Pratt as shown on page 11 considered that the amount of $449,500.77 up to the close of 1891 was a fair and reasonable prese-tation of the cost of the property having reference to the time at which the investment appeared to have been made according to the books as quoted and then he went on and gave the corresponding cash investment for December 1, 1894, as $466,532.93, the same figure that Mr. Lilley had used for December 31, 1894.

Q. Now you take that do you, as the figure for that period.

A. Yes. On my next page 12, I refer more fully to what I was just mentioning about the total investment, December 31, 1894, of 681,000 odd dollars and Mr. Pratt's statement that $215,000 of it was made *yp* as shown in this table. He again refers to the cash investment as $466,532.93 of which the material and supplies was $11,559.49 and cash and bills payable $25,546.61. This left as the plant account for the gas business, aside from the electric light $429,426.83. That is the figure Mr. Hall started with.

3678 Q. That is the figure you took for the figure covered?

A. Yes. Now in connec- with that that affidavit of Mr. Pratt there are two long sheets and wide sheets purporting to be copied from the Auditor's statements of the company, giving the investment for each year since 1877 and under each item, fifty or seventh five items covering two pages, showing investment each year under each item. There are five or six items marked with a red cross in several columns and in the right hand which is similar

to these items here, the one given here on page 12. Mr. Pratt in his affidavit said the cash investment consisted of $681,000 less the items marked with the red cross representing as he stated the exact figure which I use here and the statements that appear opposite figures on page 12 are quoted from that Auditor's sheet.

Q. The third period from January 1, 1895 to March 1, 1906, How do you get that period, how do you work it out?

A. Perhaps I should add before leaving the previous page that the reason it seems to have appeared in the mind of Mr. Pratt——

Complainant objects to the statement of the reason that appearing in the mind of somebody else eighteen years ago by the witness as incompetent on any theory whatever.

Q. What is it you want to state?

A. The facts was that it was stated——

Objected to as a conclusion and quotation of the testimony of somebody else.

A. It showed this $172,096.94 was part of the payment of $200,000 in bonds to the United Gas Improvement Company by the Capital Gas Light Company for water gas apparatus and patents. It was stated that $27,903.06 was for the water gas apparatus and $172,096.94 was for patents. It was a payment to the parent 3679 company by the Capital City.

Q. Now the next period?

A. That runs from January 1, 1895 to the sale *to* the Des Moines Gas Company February 28, 1906. During that time the new construction was $648,760.90 as shown in defendant's exhibit No. 30. The books of the company agreeing with this except that they show a writing up of the value of the property without any corresponding new construction of $131,744.44 on May 1, 1897, as explained on page 30 of defendant's Exhibit No. 30, and in defendant's Exhibit 35. A little was written off during that time I might say for depreciation, except what they wrote off in connection with repairs and renewals, charg- operating expense.

Q. Your information with respect to that, you got from the testimony here and Mr. Hall's report.

A. From the testimony of Mr. Hagenah and others and the testimony of Mr. Hall, Exhibits and testimony.

Q. The period March 1, 1906, to December 31, 1910, give us your analysis of that period.

A. During that time the books of the company in Des Moines shows an expenditure of $529,487.94 for construction including $45,000 in Valley Junction and my calculations and additional amount of $120,000 not reported on the books of the company here to pay for the new holder, the 1,132,000 feet capacity.

Q. You include that?

A. I include that although I have been unable to find any testimony from anyone connected with the company that they knew of its costing that amount and seems to me that vouchers should be produced. Now as to the $120,000 which has been accepted and

is given in this statement as having cost fully that much. The holder, however, appears in the inventory as having been
3680 built in 1903.

Q. That is the holder for which this $120,000 was allowed by Mr. Hall?

A. Yes, sir.

Q. Seems to have been built in 1903?

A. It is so stated in the inventory. It is also so stated in Mr. Hall's exhibit, but it did not come into the testimony directly except in connection with the transfer March 1, 1906, Mr. Hall put it in at that place. I have probably done so in this report but in my thought of it since I wrote those pages I have felt it should go in in 1903 and 1904, if that were done it would very greatly change the diagram of Mr. Hall with reference to the relation of net investment to earnings. There would not be as big a peak or jump of net investment relative to earnings March 1, 1906.

Q. In other words as Mr. Hall shows that item in his report it is more advantageous to the company.

A. It shows a greater irregularity and fluctuation of the ratio between earnings and investment than I believe would be shown if this were placed between the three previous years when according to the inventory it was constructed.

Q. But you have treated it as in at the time Mr. Hall put it in?

A. Yes. Now there are two items appearing on the books of the company as construction during this period which are excluded. One is bond discount of $33,950.00 and the other reorganization expense of $6,922.82.

Q. Why did you exclude those?

A. I excluded the bond discount because in the case of a company in a city of this size either the present company or a
3681 new company starting in with a practical monopoly bond or stock discount for that matter has nothing to it but a function of the rate of return. In other words whether your bonds shall have a discount or not does not depend at all on the cost of construction, depends only on what rate you are willing to pay for your bonds. A five per cent bond at 85 or 90 has a discount while the same bond at six per cent would not have any. The question has got to be taken into account, but I think the place to take it in- account is on the rate of return. It is perhaps a little better to have a low interest bond even at a discount, rather than a bond a litle higher rate at par. I — refer to that again later.

Q. Another item you took out here is re-organization expense, why do you think that should go out?

A. It does not seem to me that that enters into the cost of the property, only a transfer and whatever organization expense had been met in the plant first had been carried into construction account if the books had been properly kept previously, and if you would put it in the account now you would be duplicating the item unless you assume that the mer- cost of transfer should be charged up. It does not seem to me, however, that the mere transfer of

ownership from one company to another, both owned by the same parent company should mean an increase of capital account.

Q. As I understand this situation it was a mere change of the name of the company so far as the real ownership of the property was concerned?

A. Yes, sir.

Q. Where you say here both being entirely owned by a third company I wish you would explain that?

A. The testimony shows, states positively that all the
3682 stock of the Capital City Gas Light Company was owned by the United Gas Improvement Company and the same is true of the Des Moines Gas Co.

Q. That among other things is the reason you exclude—you may state whether that is one of the reasons why you exclude that item?

A. It is.

Q. And is there any other or further reason now you think of?

A. I question whether it should be included in any event. The courts have frequently ruled——

Complainants object to the witness testifying as to the rulings of courts as incompetent and argumentative.

A. That when one company buys out another and pays for franchise that franchise can't be capitalized for the fixing of rates and if a payment for franchise cannot be capitalized I don't see why a payment in a mere organization transfer expense can be.

Complainant moves to strike out the answer as argumentative.

Q. What is your judgment about the item as to whether or not it should be included?

A. It should not be.

Q. On page 15, under the subhead summary of construction cost I wish you would go through that table on page 16 and explain it.

A. Page 15 merely gives a combination of what has been given before, combines what has been given before in the introduction to the table on the next page and explains how the table does give that.

Q. Go over the table briefly and explain it.

A. The chief point brought out on page 15 is that $25,000
3683 known in the early accounts as old gas works, $25,000 out of $38,000 as old gas works consisted principally more of mains and services than old gas plant, but was retained on page 16 under total to works and has been so classified.

Q. What difference does it make in the final outcome?

A. Does not make any practical difference. A little difference in apportionment is all. On page 16 I place in the first column the amount that the books show had been put into the property as a cash investment prior to 1895, in other words how the $429,426.83 was apportioned. I might say that first column is the testimony of Mr. Pratt and Mr. Lilley.

Q. Taken from Mr. Pratt's statement?

A. Yes. The next column is taken from Mr. Hall's testimony shows the apportionment from January 1, 1895, to the sale February 28, 1906. The third column the subsequent period and the last column combines it all into the total of $1,727,675.67 which is construction cost at the close of December 1910, aside from working capital and without any allowance for depreciation or for appreciation and that is not in the cost item, that would be in another form.

Q. Now page 17, I wish you would enlighten us as to the matters shown on that page as far as you deem it to be necessary to understand your report?

A. In order to apportion the $45,000 an arbitrary division was made which is not of any special importance but is mentioned here.

Q. You make it how, on your own judgment?

A. Done without very much careful study. I felt that the amounts would be very much larger proportioned and the meters and services charged there than they would be in the city limits and the distance- that have to be traversed by the mains to
3684 reach the consumers and that raises the total investment of mains, meters and service as indicated in the second table on page 17. It cannot be but very little out of the way. Then -eferring again to the $45,000 I state that some subsequent investments of the company have undoubtedly gone into the business at Valley Junction in which case the investment in the city has been correspondingly reduced, that is correspondingly less out of the total which is obtained by giving the investment in the city everything but the $45,000 by as much as the investment in Valley Junction has been increased to an amount over $45,000 by so much, must that in the city be reduced as the total is in fact $1,727,675.67 given on the previous page and referred to again here. The working capital was given by the company December 31, 1894 as $37,-106.10. Mr. Hall takes it at $50,000 from then until January 1, 1910, when he made it $68,952.91. The company claims $150,000. I pos-pone that to later.

Q. Cover that in a later part of your report?

A. Yes.

Q. Now, appreciation, before you start in on that page I wish you would state how much study if any you have given to that branch or the different methods of determining value of property that is used for public service and how definite a rule there is if any as to what figure should be used or how that item should be worked out in any given case.

A. In principle I don't differ very much from the position taken by Mr. Lea and Mr. Baehr in their testimony as to method to reach depreciation, only I think they started with too high a figure on which to base it. They use the sinking fund method.

Q. What do you have to say about using the figure they
3685 took as to how you would come out in the end as to whether or not the final amount would be larger than was necessary under your notion of proper depreciation?

A. Their method of application would be about the same as I

have always urged, the sinking fund method, only I believe in taking straight four per cent sinking fund which I believe one witness did while the other had a slightly different rate for long investment or property of great age, but the difference there is very slight and hardly need be referred to perhaps, but I think the sinking fund method that the straight line method is the one because what we are after in depreciation is not at all to determine the actual depreciation from year to year, but to determine how to finance the depreciation, that is the real issue. If you were determining the depreciation from year to year most of the depreciation would come the last year or two, that is if you take depreciation to mean the real decline in the service to the company of a given piece of property. That property being kept in good repair will be about as useful the next to the last year of its life as previously, but it will come to a period, not exactly next to the last year of course but approaching that period when its utility to the company will fail rapidly and it will be scrapped up. Of course if you were to look at depreciation as merely what you could sell the property for you would have a depreciation which was tremendous the first day after installation because after it has been put in the place it could not be taken out and sold for very much value, it would be a difficult thing to do and cost a great deal. On that method of course a tooth brush would depreciate to nothing after one person had used it for one minute, but that is not the kind of depreciation sensible to use in any case of this kind. Neither
3686 do I think it is safe for a company really to wait until they — actually about to throw their property away before they take care of loss in the investment. The question then is one between the straight line depreciation and the sinking fund method and the difference might be illustrated in this way, suppose a building had 41 years' life and cost $100,000. Call it for short, however, 40 years of life and cost $100,000. It is about as useful the thirty eighth and thirty ninth years we will assume as the first, but the 40th year it is going to be torn down. You must have your $100,000 in hand. Now if you're going to set aside as both Mr. Hall and Prof. Marks did, a straight line depreciation fund without giving any interest on it, the company or the owner of the building would have to take 1/40 of that $100,000 and set it aside every year or $2,500 put into a sinming fund and invested anywhere would become worth $250,000 at the end of the forty years in a four per cent investment and five per cent it would be worth a good deal more than that. But $1,000 a net one per cent of the investment put into a four per cent sinking fund will amount to $100,000 at the end of forty years. Put it in another way, suppose at the end of twenty years a person wants to buy the building, and is willing to pay for it just what it is worth on the basis of investment, say he paid $65,000 on the ground that one half the life is gone that shows he paid what would have been in the sinking fund at that time towards the hundred thousand to cancel it at the end of the fortieth year, it probably would not be more than $30,000 in the sinking fund. In other words, would not the building be worth $60,000 or $70,000 rather than $50,000 at the end of half. Seems to me it would. I believe the sinking fund

method is the method for financing that and that does not
3687 mean the company should put the depreciation fund into a sinking fund, they can put it back into the property and earn that four per cent or five or six or seven or whatever they are able to, very presumably more than four, probably more than five. If you ask them to put aside enough to earn say, four per cent, on the amount in the property and they agree and earn more than that I should say there should be no reason why they should not keep the extra balance as a reward for their enterprise in investment of it in their own property. The consumer should grant them enough in rates so that in the most unprofitable method of investigating a depreciation fund, namely a four per cent sinking fund they would cover their costs. If they can make more than that that is their gain which I should say they should be entitled to.

Q. On page 18 you deal with depreciation, I wish you would make such explanation as may be necessary?

A. In general I take the position I think I have just been referring to although not so fully. I do make a point there that I think it would be fair to invest say, in a five per cent sinking fund in order to give the company rates sufficient to redeem the property on a five per cent sinking fund, cost of their plant or funds now in use and the company can invest and be secured at five per cent for example in its own bonds or in the bonds of other approved public service or railroad company. While I urge that I do not adopt it in this case, but use the most conservative figure of four per cent.

Q. With your experience what has been your observation or what do you have to say as to the effect of the company using what ought to be set aside for depreciation in say dividends or securities
3688 of the company and not carrying it in a depreciation fund to take care of the wearing out of the property.

A. If they did not carry it in a depreciation reserve or in a sinking fund, then they are in the situation of a capitalist who is earning we will say for convenience six per cent and appears to be earning seven, but the extra per cent should be devoted to depreciation reserve. Suppose, however, getting his seven per cent he treats it as all profit and distributes it, divides it as dividend or in any other way then what he is doing is withdrawing his capital to the extent of one per cent a year and if he does that then at the end of the time he is in the position of having used up all his capital.

Q. Now you take a plant like the Des Moines Gas Company plant where it has been in operation for a number of years such as this one has and no depreciation fund has been set aside there on the basis you think it ought to be or any other way and the plant is found to be in say 85 to 95 per cent condition, what would that indicate to you with respect to the manner in which the plant had been kept up to its highest point of efficiency, how it had been done.

A. It would indicate repairs, renewals and maintenance had been sufficient to keep the plant in excellent working order and to have covered therefore most of the depreciation, but not entirely. Anything short of 100 per cent would indicate to that extent an impairment.

Q. In this case what have you found if anything about the present

condition of the property as stated by the company itself or its witnesses?

A. As stated by the company and illustrated by their small leakage account, and in other ways like lack of complaint as to
3689 service rendered and the appearance of the plant I should consider that it was kept up in a good state of efficiency and no dispute with the witnesses that have already testified to that effect.

Q. The fund to do that has been charged to what account?

A. It has gone into operating expense although by reason of not having written off any depreciation the company having used any of the profits and meeting depreciation by putting some of them into their books as a depreciation reserve part of what has gone into capital account would be really an investment of the depreciation reserve.

Q. In the property?

A. Yes.

COURT: To what do you refer there?

A. There appears to have gone into property $1,700,000 we will say in round numbers. That really does not all represent new capital. The capital has depreciated. If they had covered the matter as I think it could have been done more scientifically they would have called part of that investment, not capital investment at all, but investment of depreciation reserve. It is merely a method perhaps of acounting for a thing on the books and it perhaps might result in confusing the matter for me to go into it in that way. Perhaps to take the books as it is that fund charged as investment of $1,700,000 and then consider you had property as depreciated is better than to go into these refinements as it really does not make any difference in the end.

Q. Comes out the same place in the end?

A. I think so.

Q. On page 19 what does that first table represent and how do you get at it?

3690 A. The first table on page 19 shows the amount of depreciation that has accrued and not been met by repairs according to the testimony of the various witnesses quoted. Mr. Lea for example has $380,000 of accrued depreciation. Mr. Baehr $310,000.

Q. These figures were worked out from their report?

A. Yes, at the page quoted in the right hand column.

Q. They are here for comparison?

A. Here for comparison. Mr. Randolph's was $282,331. Prof. Marks 364,363 before taking out appreciation on the land. Mr. Hall $245,862.00 which was arrived at arbitrarily by a six cent allowance per thousand feet of sales since 1894.

Q. You have an analysis here on part of page 19 with respect to Mr. Lea, Mr. Baehr, and Mr. Randolph, I wish you would explain that?

A. Take first Mr. Lea's estimate. He estimated the cost new of the property aside from the part that had no depreciation, the going value part and the land and perhaps one or two other things as $2,580,140 and the annual investment necessary to meet this in a

four per cent sinking fund as $37,385. These are his figures. This implies according to sinking fund tables an average life of 34¼ years and an average payment into the sinking fund of 1.41 per cent. per cent of the investment. In other words on every hundred dollars of investment you put in $1.41 a year for 34¼ years and you get the thousand principal. So the figures he uses are just the same as if he had said he reckoned the average life as 34¼ years which he would meet in this way. Similarly Mr. Baehr estimated in his sinking fund at $33,359.00 or 1.262 per cent of his cost reproduction now on the depreciable property which was $2,642,467.

Q. That was the amount he worked out in his report.

3691 A. Yes, and that implied an average life of 36¼ years.

I turn next to Mr. Randolph whose figures in a similar way imply an average life of 39 years.

Q. And is still smaller than either of the other two?

A. Yes. I think under the circumstances thirty six years is a fair average of these three witnesses and is certainly very conservative for it is rather shorter than the usual figures of average life of a gas plant of this character, rather nearer forty years or over. For example I think it would have been safe to say forty one years and the payment of one per cent a year into a four per cent sinking fund or if it only had been thirty eight years the payment of one per cent into a five per cent sinking fund to cover the depreciation. But I have adopted the four per cent sinking table and that required 1.289 per cent a year on the investment and further that sinking fund really should be reckoned on the average investment which would mean the investment—the cost of the land to be excluded because that is not depreciable as a matter of fact, but it was rather difficult to exclude that as the data on the cost of the land was not very clear to me in the evidence so I left it all in there as the books had it $35,000.

Q. Turning to page 21 under the sub head, if that is a correct term, valuation at the beginning of each year with one half the additions of the year. I wish you would explain what that tabulation indicates.

A. Beginning with January 1, 1895, 429,000 odd dollars without the working capital which is put in later, but it is not supposedly depreciated any more than the land, starting with that it takes depreciation——

Q. Right at that point if you were — put in working capital as an addition to the value of the property and then work out the
3692 depreciation method would that be to the advantage of the company and disadvantage of the consumer or the opposite?

A. It is thought, I believe, it is about as broad as it is long, you would get a little larger requirement or yearly fund from the operating expense, you would have to add a little more operating expense, on the other hand, you would get a little greater depreciation at the end to deduct from the investment. Capital account therefore a little less and operating expenses a little more. I don't think there would be much difference.

Q. If you will, go through the first line there.

A. Take the investment as January 1895, as sworn to by Mr. Pratt and Mr. Lilley at $429,426.83, adding one half of the additional investment of that year as *tes* testified to by Mr. Hall on the theory that the investment is more or less uniform through the year, an investment in the whole year is equivalent to half of it, as a matter of fact for the year, the whole of it, for half of the year as the whole exceeds half, then we come to the next column average investment aside from working capital by taking the other two columns, then apply depreciation 1.289 per cent and the last column gives what the proceeds in the sinking fund would be, the first year it would be merely this depreciation, the second year it would be four per cent interest on that fund together with the new depreciation of 1.289 per cent applied to the average investment of the second year and so on down.

Q. Then down at the bottom of the page what does that last row of figures represent then?

A. That shows that the average investment at the end of the year aside from working capital was $1,667,000.

3693 Q. The average investment, is that you call it?

A. Yes.

Q. The value of the investment at that time?

A. It is the nominal investment on the books of the company and proceeds that should have been in a sinking fund and which I in another table charge to operating expense which it may be said would be $241,000 in round numbers. In other words, the plant items is not really worth the $1,667,000 which appears on the books, but $241,000 less which might have been accumulated by this small amount in the sinking fund.

Q. For each year?

A. Yes.

Q. Now page 22, explain that as rapidly as you can.

A. There I take the last year, taking the year 1910 which more directly concerns the future in the matter of what it means to operate in for and that $21,490.00 used on the previous page is again necessary to set aside last year and is equivalent to 4 cents per thousand feet of sales of 1910.

COURT: Mr. Marks made it six cents.

A. Both Mr. Hall and Mr. Marks made it six, but they did not assume that the investment put into sinking fund drew any interest and if you are going to use operating expense in an amount sufficient for the depreciation, that depreciation must be set up somewhere it seems to me. The plant in other words has depreciated some amount between $200,000 and $400,000, that is the agreement of all the witnesses. Now what I am trying to find out, I attempt to base it typical of the future, for that is what seems to me the important thing is the future under the new rate ordinance, for example beginning the first of January, 1911. The thing to do is to try to determine from the history of the past how much it would

3694 be necessary to set aside to meet depreciation, that is one of the problems. Now the amount that had been necessary to

meet depreciation in the past has not been more than 1.289 per cent of the investment which is now right around or about 4 cents per thousand feet of sale. Therefore, I assume that it won't exceed that in the future, the immediate future at least. Then another important point from the study of this past is what has the company got of value in its investment today. It has not got the $1,667,000, that is what it has put in. I am now leaving out working capital, it has put in that amount, but that is depreciated. All the witnesses say it is depreciated from $200,000 to $400,000. The company has not charged that up in any way and it must be deducted from their investment. They have an actual investment today of 1,600,000 odd thousand dollars less depreciation. In other words they can't have the cake and eat it too. They have really withdrawn the fund or put it into the plant under the name of capital when it is not there properly as capital, but part of it is there as depreciation reserve, if at all. The actual depreciation being taken at a little over $240,000 we must start with the value of the depreciated property. Of course if it could be shown that the company had made no money whatever in the past, and I refer to that later, if it could be shown that it made very little money or a very unreasonably low amount of money so that it could not have taken care of this depreciation, then as the Massachusetts gas and electric commission has always held special consideration should be given in fixing the rates to that fact and if it should appear as I thin- it will later that the profits of the company have been sufficient to have allowed it to have set aside a sufficient depreciation fund and still have
3695 had good profits then that need not bother us now.

Q. Now beginning right there with the year 1910, the figure you work out in your table there of $21,490 which you say is equivalent to four cents per thousand feet of the sales of that year, am I to understand from what you have just stated and what appears here on page 22 that an investment of that amount in say four or five per cent bonds, say five per cent bonds or five per cent sinking fund would take care of the depreciation to the property in your judgment?

A. I say that four per cent will take care of it to the extent of $241,000 which I think is probably all the depreciation.

Q. Up to that time?

A. Yes, sir.

Q. You say something here about investing that in their own bonds. The bonds of the company as you understand it draw five per cent interest.

A. Yes. Furthermore, there are two points to be observed on this. While Mr. Lea and Mr. Baehr as shown on page 19 took a depreciation of between $300,000 and $400,000 and Mr. Randolph $282,000 they based that on a duplication cost or a cost new or a very much larger amount than the books show to have been the cost of the investment. And their percentage and their method of reasoning seems to me all right, it is only that their base figure, the figure to which they apply depreciation is on an investment greater than has taken place.

Q. What do you say as to whether or not that is accounted for in the fact that both Mr. Lea and Mr. Baehr were working out a valuation based wholly on a reproduction theory.

A. Yes.

Q. And without reference to book cost of the property?

3696 Objected to in the first place as leading and in the second place as incompetent because purely argument and nothing else the witness being asked to argue the effect of the testimony of other witnesses and not being asked to state any fact or any opinion as to any matter of expert knowledge.

A. They have rec-osed the depreciation as it seems to me upon a proper method upon what they think it would cost to duplicate the property and not upon what it has cost the company. They would therefore have the consumer pay to them a fund sufficient to finance the depreciation and give them back 100 per cent of the property as it would cost to duplicate today and not on what it ever cost the stockholder.

Q. Why do you figure interest on the appreciation reserve as you set it out?

A. Because the amount must either lie idle that we set aside to meet depreciation or it must be profitably employed. It is absurd to think that a company having set aside a certain fund to meet depreciation would allow it to lie uninvested and bring no return. It would naturally and the least profitable thing it could do with it would be to put in a four per cent sinking fund.

Q. What about the situation or liability to be drawn at any time for renewals or repairs?

A. That I meet in a large measure by saying that not a cent of it has been drawn. This is in addition to every cent that has been spent by the company. Now a cent has ever been drawn. This is purely and absolutely additional to any and all repair and renewal account. And furthermore in fixing upon an average life for the plant in determining a sinking fund, no matter what average you take, assume for a moment you take 37 years and I think Mr. Baehr at one time testified in this case 37½ average years which is
3697 a little longer than he really used in his table, suppose you took thirty seven years as the average life and you see that before that thirty seven years was up some of the investment in the depreciation reserve must be withdrawn to meet some property that has to be renewed at the end of twenty years. There are other parts of the property like most of the mains that won't have to be renewed for seventy five or a hundred years and that was all taken into account supposedly in fixing thirty five years. When Mr. Lea and Mr. Baehr and all the men who attempt to work that theory of a sinking fund they reach an average age only at the end of a long series of computation.

Q. What is there about the life if it has ever been determined or wearing out of the mains and services?

A. Where electrolosys is not present any more than the testimony shows has been present here, practically not at all, and where the

soil has not any particular assets, principally ashes and salts to corrode and injure the mains, there appears to be no known life. Mains are in existence today in some parts of Versailles and Paris and elsewhere that have been in much over two centuries. There appears to be no limit to the life, yet it is customary in getting a sinkind fund and in questions of age to give a life of seventy five to a hundred years.

Q. About what portion of this plant for instance speaking of the value of the property or the investment is covered by the mains as distinguished from the rest of the property?

A. That is given on page 16 where I use that $650,000 approximately out of $1,727,000 or some what over one third is in the mains.

COURT: That don't include services.

A. Oh services will not last anything like that. They won't last more than fifteen to twenty five years generally. Of course
3698 that depends a good deal on local conditions.

Q. You are speaking more particularly of the mains?

A. Yes.

Q. In this matter of depreciation, Professor, this reserve fund as you have figured it out on page 21 defendant's Exhibit 43, while that fund has been accumulating, what do you have to say under your method and plan of carrying on the operation of the plant could be done in the way of maintaining the efficiency of the plant aside from piling up this reserve?

A. If a plant is kept to such point of efficiency as this plant has been which has been testified variously from 85 per cent to 90, along in there it is sufficient.

Q. How is that to be done?

A. It has been done from the repair and maintenance account here. This is the depreciation which Prof. Marks referred to as residual depreciation, it is over and above what was taken care of.

Q. In other words this fund, $241,117.06 as accumulated under your table here at the end of the year 1910, is to cover that residual decay or depreciation that goes on, notwithstanding repairs.

A. I want to add that I think that the figure $429,426.83 taken as the valuation January 1, 1895, for it was given by several witnesses like Mr. Walton Clark and Mr. White and others, Mr. Cowdry and others is about the same Mr. Pratt had given as the investment January 1, 1895, and I believe that there was some depreciation in there which had not been accounted for. That the nominal investment was $429,000 as shown by the books or cost about that amount to duplicate it is the testimony of Mr. Cowdry, now manager of the Peoples Gas Company of Chicago, and Mr. Pratt, as I recall it and
Mr. William Henry White, a big gas engineer of that time and
3699 Mr. Walton Clark of the parent company. And I believe that in its then condition there was a depreciation there and that it would have been proper to have started with a lower figure than is taken here, but as this was the testimony of all those witnesses at that time, I believed it was certainly not unfavorable to the company to start with what their witnesses had at that time testified.

Q. Accept that as a basis?

A. Yes.

COURT: When was that?

A. 1895.

Q. On page 24, is another table following the statement that it shows the investment at the end of each year as found by Mr. Hall. I wish you would explain what that table indicates.

A. You are referring to what table?

Q. On page 24.

A. It takes the investment starting with 429,000 odd dollars at the close of 1894 adds to it the new investment of each year as given by Mr. Hall from the books of the company, in the next column it shows the proceeds of the sinking fund, the last column shows the investment less that depreciation fund.

Q. So that the last three columns or last line of figures in the three columns opposite the year 1910, indicate, what?

A. They indicate that assuming there has been a depreciation of over $240,000 in the property and therefore that it is not worth today the investment of $1,727,000. It is an attempt to show how that depreciation could have been financed in a sinking fund and that an investment, therefore, less the proceeds or cumulations of the sinking fund would be this figure.

3700 Q. In other words, if I understand the table correctly it indicates how the investment could have been maintained at 100 per cent.

A. If they had placed an additional amount to operating expense which I refer to later, they would have had a sinking fund of this amount to take care of the depreciation.

Q. You mean an operating expense?

A. Yes, if they had charged operating expense the depreciation fund of 1.289 per cent a year on this investment in the first column they would have had enough to take care of this depreciation and they would not have to face the fact today of a depreciated investment.

Q. Mr. Brennan suggests that he finds a mistake in the subtraction there. Will you subtract the last line of figures in the first column, the last line in the second column from the last line in the first column and see if you get exactly the result that is shown here.

A. I get $1,486,540.61 instead of 558.

Q. That is an error there of $18, that should be 540.

A. I think so. The last line, last column page 24, instead of $1,486,558.61, it seems should be $540.61.

Q. On page 25 you take up working capital. I wish you would give us whatever explanation on that subject you think is necessary to make clear what you think about it.

A. I first call attention to the recent decision of the Wisconsin railroad commission of last year.

Objected to as argumentative, really it would come with more propriety from counsel than witness.

A. Well I didn't dwell upon this to any extent, but just on that

page I refer to their setting aside a little less than fifteen per cent for working capital in a company, a gas company of about two thirds the size of this one and the reasons they give for not setting
3701 aside a large amount.

Q. Now give us your own conclusions about it?

A. Then I state that two months of operating expenses is I believe all that is necessary to have in hand to meet the needs of working capital.

Q. Why?

A. Because in a gas company the receipts come in every month, and in fact a good deal all through the month and the bills——

Q. Right at that point, why do you say all through the month?

A. Because they are not all paid on one day, but the month may be taken as the unit and every month they get paid for the gas sent out and that means that in that month's receipts they must have enough to meet that month's expenditures, the expenditures of the previous month since the receipts are larger than the expenditures. The laborer has to be met every month, twice a month I think they pay here. The larger bills for coal and oil are met every month, but need not I believe be met more largely than one or two months' supply at a time or three months say at the most for while coal may be delivered along under a contract made to cover three or four years duration as is done in such cases and is done here, the deliver-s of course are not all at once for three years, but deliveries are largely as needed along from time to time and therefore two months' supply —to supply a working capital sufficient to meet operating expenses for two months would appear ot me o be sufficient and I have given a slightly larger amount, an amou-t equal to the fifteen per cent of the gross income allowed in the recent Wisconsin decision or $80,000.

Q. Before leaving this question of working capital, this figure of $80,000, what period was it your judgment that that amount
3702 of working capital for the business, or that that would be sufficient working capital for this company under this present condition or for the future.

A. The $80,000 was the estimate I assume as fair for the year 1910. If you will notice page 27 it is gradually increased, the amount from 1894 on. It is for 1910 15 per cent of the gross income. It is more than two months, it is nearly three months. That $80,000 is in reality nearly three months' expense account as shown on page 26, the page before. During the following year I should assume it would be increased somewhat just as it had been increased in the previous years.

Q. Passing from pages 25 and 26, working capital, you may state enough with regard to the table on page 27 to show what it is intended to indicate, what it does in fact indicate?

A. The first column on page 27 indicates a net investment after deducting depreciation or after deducting the amount necessary to finance the depreciation. After deducting in other words, the sinking fund that we have been talking about. The next column gives the working capital which is to be added to the net investment.

Q. Then the three last lines of figures in the table indicate what?

A. The last column indicates the net investment with the working capital given as it should be so that at the close this is the net investment after deducting the amount necessary to be in the depreciation fund, $1,486,000, add the $80,000 for working capital and get $1,566,865.

Q. Am I to understand from that statement and explanation you have just made that upon your method of working out the investment, the net investment in the business, that at the end of December 1910, the total net investment or the total amount of money used
3703 in the business at that time was $1,566,865.

A. That represents the investment that is put in. It is does not mean a question of whether the land is worth more now or not, but takes account of what has gone in as investment, less depreciation.

Q. And with no appreciation for real estate?

A. No.

Q. On page 28 you deal with overhead charges. In a general way what do you include in that term, what do you cover by overhead charges.

A. As stated in the first paragraph I refer to engineering and to supervision during construction, drafting, interest charges, legal expenses and contingencies casualties, and omissions, there are all sorts of items which you perhaps do not see in the finished plant, but which must — existed.

Q. In the examination and investigation you have made here and information you have gathered during this trial what do you have to say as to where in the accounts of the company if at all the money used for the purposes just mentioned has been charged.

A. It has been charged I believe so far as spent to operating expenses.

Q. Why do you refer in your statement there as one of the overhead charges to omissions and contingencies?

A. Because the claim is always made that there are omissions, and cases differ greatly as to the extent of omissions. In an inventory of the kind that has been prepared here omissions have been shown to be very slight.

Q. Have you gone carefully through the reports of Mr. Lea and Mr. Baehr and Mr. Randolph for the purpose of analyzing those overhead charges and working out the amounts that they have carried into their final figures and their conclusions?

A. I have I think except Mr. Randolph, I think he did not give opportunity for the consideration.

3704 COURT: He added 20 per cent, so if you divide by 120 you will get it.

A. The other two witnesses, Mr. Lea and Mr. Baehr gave figures from which I have tried to compute the overhead on all the property except the paving because their overhead on paving I think should be included with the whole question of paving and the problem of overhead on the cost of the property could be taken out by finding

total overhead. I tried to do that, if I did not succeed exactly, I think I am very near to the figure.

Q. What result did you reach?

A. I have the result on Mr. Lea's overhead on all property except paving was $387,739 and Mr. Baehr's $443,839. In other words they were both in the neighborhood of $100,000.

Q. Now what was their original figure of overhead before you tried to work out these final figures.

A. You will see the figure in the table practically by adding for Mr. Lea the first and third lines.

Q. Up in the body of the page there?

A. Yes, I use it there too, $567,780 for Mr. Lea beginning the second paragraph and Mr. Baehr $615,603.

Q. From these figures what was it you deduct?

A. I deduct overhead on paving, overhead on the rest of the property and I do that on the basis that the overhead on paving—the overhead on the cost of the property could be taken out by finding what proportion the paving bore to that class of property.

Q. What were you trying to ascertain as these overhead charges, just the amount that was included by these gentlemen in the property?

A. In the property now.

Q. Of the plant?

3705 A. Of the plant.

Q. Without reference to paving.

A. And when I gave you figures a minute ago of how much they had in the overhead after deducting paving, it was the latter figures of the last two lines of the table on page 28 which was aft- I had the property depreciated as they depreciated it. If you take it on property in the third and fourth lines shown in the table, Mr. Lea had apparent overhead aside from that on paving of $455,892 and Mr. Baehr $502,934.

Q. Then you make some further reduction from these figures?

A. Yes.

Q. For what reason?

A. I was trying to get to some extent the present depreciated value of the overhead. I do not have to use the figure in any direct computations afterwards and did not go into the matter quite as fully and minutely as I should have done if I had needed to use it in any later computation. This was intended as a rough approximation of those items.

Q. Did you figure out the proportion or per cent that Mr. Lea and Mr. Baehr had included in their overhead, the per cent of the whole?

A. Yes, I gave that on that last line of that page. It was 26⅔ in the case of Mr. Lea and about 28⅔ in the case of Mr. Baehr.

Q. On page 29 you deal with the book cost of the property and the investment and the increase of the property. I wish you would make whatever explanation of that page you think necessary?

A. I first call attention to the fact at the top of page 29 that — repeated investigations of the subject only 12 per cent has been allowed in all Wisconsin rate cases.

3706 Q. What was the per cent allowed here by Mr. Baehr and Mr. Lea?

A. About twice that, little more than twice. As I stated here at the top of page 29 Mr. Lea raised the property aside from land to 28 per cent and Mr. Baehr about 30 per cent for overhead charges.

Q. That covers any omissions and engineering?

A. There is no difference between page 29 and the figures on page 28 are the figures of value of the property only at the top of page 29 the per centage is added to get the total.

COURT: On new paving, according to Mr. Lea, it is $112,000?

A. That is overhead charges. These overhead charges alone I refer to on a later page. In other words while the fund was paid in by the city they get an overhead on it as a credit.

COURT: The total amount of that overhead by Mr. Lea is a little over $120,000, that is about one third.

A. May be.

Mr. BYERS: It was $567,780.

COURT: No the total amount of his paving, replacing paving.

A. I think if you would turn while you are on it, to page 33, give exactly the figures on pacing with overhead in it of both Mr. Lea and Mr. Baehr and you will find that the overhead on the paving, the base figures of Mr. Lea $419,685 new, $375,098 present value. Mr. Baehr $393,000 new and $344,890 present value.

Q. Is there any further explanation to be made of pages 29 and 30?

A. Page 29, the last paragraph points out a new thought.

Q. Tell us about it please?

Objected to as purely argumentative, not the statement of any fact or of any expert opinion and purely an argument on a ques-
3707 tion of law as to whether this paving charges should be allowed.

A. First the consumers as a part of the taxes have paid for the paving. They are now asked in the price of gas to pay interest on it to the gas company on the theory that a new company would have to cut into the paving and duplicate the system. The other point that I make is still more important and is that if the company is to receive an ingrease of value from year to year through an unearned increment or unearned benefit from the city in paving, it is likely to continue to receive such favors for only half of the mains are now under paving, according to the testimony and the paving now over mains is not as good as it will be 20 years hence as an improvement in the character of the paving always follows growth of a city. Now then in the past this paving has amounted to $300,000 to $400,000 and this divided over the entire sales for the last twenty years amounts to over 8 cents a thousand feet. That should be cents instead of per cent, the second line on page 30. If there has been an unearned revenue to the company to be capitalized in fixing the rates of 8 cents a thousand feet in the past it is likely to be something like that figure in the future, anyway several cents per thousand feet and I think that should be taken into account in fixing the rates as a further revenue if the theory is adopted that the company

has the right to increase its capital with the increase of pavement over the mains paid for by the consumer or tax payer then that also becomes a revenue of the company, that increase becomes a revenue of the company which they realize on in the capital on which they charge a return for gas.

Q. It was not quite accurate was it to say that the pavement had been paid for already by the tax payers.

3708 A. Well bonds may have issued for it or the abutting property owners may have paid, but the gas company did not pay for it, does not claim to own it, never returns it for taxation, don't keep it in repair. The main point is there is an unearned increment there is allowed to figure that. It is so broad and as long one way as another and whatever you put one place you have got to take off another.

COURT: Twenty five per cent of the mains were laid under pavement and about 21.1 per cent as I figure it have been paved over since according to the evidence. In other words, twenty five per cent according to the testimony of Henry Moul, and that is the only testimony on it, of the mains that were laid were laid under pavement and the whole amount of pavement now I think is 46.1 per cent so that they stand in the relation of 25 and 21.1 per cent. I call your attention to that so if you want to make any statement, you may.

A. The amount, 25 per cent was put in you und-rstood from Mr. Moul after the paving was laid.

COURT: That is his testimony and that is the only testimony I think on the subject. That was in response to a question put by Mr. Brennan or Mr. Byers, I don't know which. I figured it myself taking Mr. Lea's statement, I figured it myself as 46.1 per cent of the whole amount of mains are under pavement, that makes 21.1 per cent that was laid before the pavement was put down.

A. Of course all the cost of laying mains that were laid after the pavement is included in this investment already used.

Q. Then with these figures stated by the Master your statement that half of the mains are now covered by pavement is not quite correct.

3709 I knew it was not exactly. I used half as nearly 50 per cent, his figure is 46.1 as I understood. I knew it was not quite half. I have the figures in my room. But I should believe from my knowledge of the city and all other such cities that the paving now laid is more expensive than the paving originally there in many cases, in the case where mains were laid without paving. In other words the figures Mr. Lea and Mr. Baehr give here as cost of paving over mains is a larger item with respect to those mains that have paving over them,—that had to be laid through paving than the original cost of cutting through that paving because the paving then in many cases, I can be morally sure was not as good paving as they are now because the whole tendency of paving is to increase in value, in costliness, poor paving being extensively replaced by better and more expensive paving.

COURT: That is of course something you don't know one way nor the other.

A. No not a thing. Simply the general tendency.

Q. As far as their figures are concerned they base them on the character of the pavement as it existed at the time and as shown by the inventory do they not?

A. They base their figures on the paving as it was January 1, 1911 or in November, 1910, as it was in the inventory and not on the paving that was there when the mains were laid.

Q. Are you sure about that?

A. I am talking about Mr. Lea and Mr. Baehr. They were putting a price on the inventory made last November.

Q. For pavement at that time?

A. Yes. That is certainly the time I read the inventory and their testimony.

3710 Q. On page 31 of your report under the subhead of total discount on bonds, I wish you would tell us what you work out there if you will and what importance if any it has in connection with this matter?

A. It has a reference to what I stated a little while ago that discount on bonds is a question of the rate of return and not a question of the cost of property and a bond, five per cent bond bearing a ten per cent discount is not very different from a five and a half per cent bond at par. I worked that out very precisely in a later point in the report. But the entire point is not very important in this case since the entire bond discount shown by the books is only $53,950.

Q. Now on page 32 you deal with the rise in the value of land. Let me ask you about that before taking up your report just as you work it out here. You were down at the plant and looked over the property were you?

A. Yes.

Q. Did you observe anything about the real estate that indicated to you any increased value for the purpose of manufacturing gas in the real estate itself or anything about it from its original character?

A. It would not appear to me so no. It had the same advantages then that it has now.

Q. What change if any is noticeable down there in the ch-racter of that real property now from what it was evidently twenty five or thirty years ago.

Mr. GUERNSEY: Allow me to ask the witness to state whether he saw it twenty five or thirty years ago, that might be material to the question?

Mr. BYERS: You can ask him that later on, you are going to have a lot of time.

3711 A. There are few new improvements that I notice in that neighborhood.

Q. I don't mean that, is there anything about this land itself that in any way has changed the value of its use, I don't mean the value of the property itself, but has anything about the land itself in the way of a change of its surface or conditions of the surface that has changed the value of its use for manufacturing gas?

A. No.

Q. So that whatever increase if any there is in the value of the

land itself, is an increase in the market value of the property for general purposes, real estate for general purposes, is that so?

A. Yes.

Q. With your experience and the information you have gathered during all the years of your busy life, how would you deal with that kind of real estate in a rate case if you dealt with it at all, that is the increase in the value of the real estate.

A. Until a property is sold when the increased value would be subject to division as surplus I don't think it should be capitalized at all.

Q. What difference is there between the increased value of the real estate and the surplus or earnings on deposit and subject to division among the stockholders.

A. It is a surplus of the same general character perhaps, I have thought it would be more similar to the surplus over paving. It is a surplus of course not directly earned by the company. I hold that in a regulated and more or less protected monopoly the investment is the sole question, we give the right to earn a depreciation fund, the right to develop and promote business out of oper-
3712 ating expenses and having done that we have the right to restrict the possibility of speculative earnings more than is ever attempted under competitive business.

Q. What do you have to say for a company now for the purpose of fixing a fair charge or rate for services is to be allowed to capitalize the appreciation on real estate, increased value of the real estat where there has been no increase in the value of the use of the real estate, in cases where they are allowed to consider that increase for the purpose of rate making, then wha do you have to say as to what should be done on the other side of that question with that increase.

A. It should be considered just as I explained in the case of paving. It should be considered as an increase likely to continue, certain to continue and that probable yearly increase should be considered a revenue of the company as has just been decided to be the case in two decisions by the New York Public Service Commission of the 1st district.

Q. That is to say the average annual increase in the real estate over and above its original cost is carried into the revenue of the company?

A. Yes. But I don't know how much the land here cost for while I used the figure and thought at the time when I wrote that that it was $35,000 basing it on some exhibit of Mr. Hagenah's I think since then that I learned that some further purchases were made, but I believe $50,000 would perhaps be an estimate of the increased value of the land on the city's witnesses and the company claims much more than that, but even $50,000 increase in the value of the land is over 1.10 cents on every thousand feet of sales from the starting of the company and there is no reason to doubt
3713 that such increase will continue in the future and if more than $50,000 increase has been had in the past it might be reasonable to say more than that would occur in the sales in the future.

Q. If that theory was carried out rigidly and the increase in the value of the real estate was large enough it would after awhile absorb the entire rate that was charged for gas would it not?

A. What is that question.

Q. Suppose a large manufacturing plant was located within a block and a half or a block of this land down here and would increase its value several hundred per cent over what the company now claims, what effect would that have on the consumer if the rate for gas was to be based on the increased value of the land?

A. Would have to be a very big increase in the price of gas. If a great railroad terminal was established next to it, or a big oil well discovered near the land, natural gas wells.

Q. Or a civic center like has been built over here?

A. Yes.

Q. Even gold mine?

A. Perhaps a coal mine.

Q. Returning to page 32 you may state if there is anything further you wish to add with reference to the matter that appears on that page. That summarizes what I have just bee- saying. Calls attention to the decision in New York state which has taken that position.

Q. Is that the district in New York that the complainant referred to here during the taking of the testimony of one of the witnesses, I think Mr. Randolph perhaps, but one of them anyhow referred to some method of the first district in New York, is that the same district?

A. I don't recall what you refer to, but it is the district
3714 that *that* covers Great New York City. The state of New York is divided into two districts, one called the first district having New York City or Greater New York and the other in the rest of the state.

Q. This district is the district from which the gas case went to the supreme court?

A. Yes.

Q. The Wilcox case?

A. Yes. And this decision was made in the district where that decision was rendered.

Q. Just recently?

A. This decision was rendered in 1908 I believe.

Q. This decision of the commission?

A. The decision of the commission was rendered this summer, rendered in August I believe, rendered last month, one decision last month and one a -onth or two earl-er of the same character, two decisions. Both since this case opened.

Q. What I had reference to as being offered by the other side was some publication showing the system of bookkeeping that had been adopted in that district especially with reference to donations and that class of operating expenses?

A. I think a reference was made to the classification of accounts that was adopted by both commissions of New York state in some joint conference.

Q. Now page 33, have you covered that as fully as you care to in your testimony up to this time?

A. I think so. It shows how much is allowed for paving by the witnesses new and upon depreciated value.

Q. I wish you would explain that a little more fully if you will.

3715 A. On the lower part of the page is shown the mains and services as a whole, Mr. Lea gave a value new of $1,963,027 and a present value of $1,732,963 a depreciation of 11.72 per cent. If there was that depreciation on the mains and services including the paving, there must have been from the way they testified I judge the same depreciation on the paving alone for they testified they did not take the depreciated value of the paving as paving, but how much it had depreciated as part of the system of mains and therefore applying these percentages of depreciation to the value they give for paving new as shown in the first table on page 33 I get what appears in that table and last column as present value of paving.

COURT: If they use both the pavement, cost of replacing pavement and cost of laying mains and cost of mains, if they depreciate all of it that would be the depreciated value of payment and that would not depreciate at all as far as they are concerned.

A. Pavement depreciates much faster than street mains?

COURT: They don't have to keep it in repair?

A. No. By assuming that the paving had equal depreciation to the extent that the mains depreciated they retain a larger value than if they had assumed the paving had depreciated as much as it actually has for paving has a shorter life than street mains.

COURT: To my mind that is an advantage rather than a disadvantage in other words the same proportion of depreciation is there used.

A. Yes. I am trying here merely to see how much is involved in the pavement question.

COURT: I understand that, but while we were on that point I wanted to call attention to it and get your idea of it.

3716 A. My idea is that the paving has depreciated as a matter of paving much more than the mains have depreciated and if the court allows the pavement theory as they have given it and deducts that you may have to deduct annually that same percentage on the pavement as on the mains. But the point that strikes me as necessary is that the same amount of increase in the value of the property by virtue of the paving becomes also a probable revenue in the future, there is a probable increase in paving in value.

COURT: Prof. Marks said I believe, he said the dry ground under a pavement where mains would be *made* them practically last always, that is to say there was nothing that would deteriorate them. I just want to call your attention to that, if that was true then does it affect the question of depreciation quite materially.

A. I have not understood from all the evidence I have ever come across that paving affected the life of the main one way or the other.

COURT: That is his testimony I think that made it so they practically last always, that is not the exact language.

A. I heard his testimony but the thought I understood him as meaning is that all mains were practically without limit of life, I didn't understand that he meant the paving would increase the probable life. If he did say that it is a new point to me.

COURT: Paving has to keep a dry foun*b*ation?

A. That does not affect the life of a main, dry foundation.

COURT: That is what I am calling attention to as to what he said.

A. I will have to look that up but there is as long life to water mains as gas mains and water mains of course are full of
3717 water. The mere presence of water along or about a main is not what affects the life, it is acids or electrolysis.

COURT: There would be less electrolysis with dry ground than there would be with wet?

A. That is true, yes. Does not seem to be much of it any way here.

Q. On page 34 you say something there about what would follow if next year the paving to the extent of $300,000 should be made over these mains.

A. Of course that would not affect this matter in any way unless it was necessary to make a new rate.

Q. Then it would that is your notion of it?

A. Yes. Well it would be my notion tha- if the theory is maintained that the company is entitled to a return on the paving that such increase of paving they could go to the court and say we can no longer have this o-dinance for our capital has been increased by this paving, and we must have more return on our investment.

Q. It is your notion that readily follows this paving theory?

A. Yes. In a perfectly stationary town and perfectly stationary sales and stationary expense, but nevertheless with an increase in its interest, if pavements have been greatly increased the price of gas would increase under the system of regulation of rates where you attempt to have the regulation always just enough to give a reasonable return on the investment.

Here the further hearing was adj-urned until 9:30 A. M. tomorrow.

3718 Thursday Forenoon Session.

SEPTEMBER 21, 1911—at 9.30 a. m.

Counsel for the respective parties all present.

Testimony on part of defendants resumed as follows:

Prof. EDWARD W. BEMIS, continuing his direct examination, examined by Hon. H. W. Byers, testified:

Q. Professor Bemis, in arriving at your conclusions as to values and operating costs and in making up your tables of figures and

conclusions, did you consider or allow in any way the element called going value?

A. No.

Q. I wish you would explain the reason why—what if anything you did do about it.

A. Going value may represent either one of two different things. According to one theory it represents the cost of getting the business, or the difference between the profits of a going company and the profits that a new company would make during the years assumed necessary for construction and for securing the same amount of business. According to another theory, which has been used to some extent in Wisconsin, it represents the losses, or early losses of a company—the failure to make at least what is assumed to be some reasonable rate of return. According to that theory the more unprofitable the company has been, provided ordinary good management can be shown, the more going value it is entitled to.

Q. That is, the more unprofitable the business?

A. Yes. According to the other theory, the more profitable the company and the larger the company, the more going value it is entitled to; but the theories in a measure contradict each other.

3719 Q. Now the first theory, the one arriving at the going value by taking the difference between hypothetical operation and the existing plant, in the theory adopted, as I understand it, by Mr. Baehr and Mr. Lea?

A. That is right.

Q. And the other theory, the — of arriving at going value by capitalizing early losses, is the theory adopted by Mr. Hagenah?

A. Yes.

Q. Now, is there any other method that you know of that has been used?

A. There is a third method—which also should have been mentioned—adopted by Mr. Randolph, which, as he explained it on the witness stand, consists of studying the history of the last year, or last few years, finding a certain increase in the number of meters and noticing what percentage of increase there would have been to have kept pace merely with the increase of population—assume that to be an increase that would have cost the company nothing in the line of solicitation and new business expense. The other increase *increase* would be assumed as due to some special efforts on the part of the company, provided the price remained the same; find what that total expense of solicitation has been or of trying to get new business and dividing that over this amount of what might be called extraordinary increase assumed to be due to the special efforts of the company; find the ratio per meter between the two and in that way get the figure of cost per consumer or per meter; that cost due to special effort. Then I would understand that would have to be applied not to all of the meters in use, as I rather think Mr. Randolph did, but to that proportion of the meters in use due to those exceptional

3720 efforts. A figure is arbitrarily reached of $20 to $30 a meter—Mr. Randolph reached such figure himself by that method.

Q. As a matter of fact, is it not true that all three of these methods in a way are arbitrary and the result reached rests entirely upon the judgment of the particular person who is making up the computation as to the base figures or the foundation of the final result?

A. I have never understood any claim made that it rested on anything more than the judgment of the witness.

Q. Now you worked out from the reports of these several gentlemen the amount included in their final figures as going value, did you?

A. I gave the figures that they allow for going value on page 37 of my report; that is not based upon any computation of mine—that is based on their direct testimony.

Q. As to the amount that they included for that element?

A. Yes.

Q. Now you go over that quite fully and give your views and judgment about it, do you not, on page 37, 38, 39, 40 and 41 of your report?

A. That is true.

Q. Now, resting your answer upon your own experience and judgment in matters of this kind and what you know about the operation of gas plants and the method of carrying on the work of manufacturing gas, what have you to say about that question of going value; what relation, if any, or what consideration, if any, it ought to have in a rate case?

Mr. GUERNSEY: Of course our objections go to all of this testimony——

3721 The MASTER: The objection applies to each and every answer of the witness, to each and every question and to each and every part of the same as fully as though repeated to each.

A. I do not think that in a rate case going value should be included as a basis for fixing rates. As between the various theories, I think that the idea back of the Wisconsin theory has some validity, but I think the application of it made by the Massachusetts Commission is a better application.

Q. And that is fully explained here?

A. Yes.

Q. The matter found on page 42 of your report, I wish you would explain that briefly—what reference, if any, that has to the going value question?

A. I attempted to show that the profits of the company had been on the physical investment, or the book investment, during the entire period of its life.

Q. And how did you attempt to show that; what items if any were included or excluded?

A. The next page, page 43, shows part of the process.

Q. I wish you would explain that quite fully, that table on page 43.

A. Beginning with 1893, with the gross revenue as reported by Mr. Hall, and the operating expenses also as reported by him, that

I think I included—I intended to; and I think I did included in the operating expenses an accident or series of accident claims.

Q. Amounting to $3,689?

A. Yes, which Mr. Hall by mistake had omitted. The deduction of the operating expenses from the gross income for each year gave the nominal net income, which is in the third column,—that income would be as it appears on the books of the company, with
3722 slight amendments and changes that Mr. Hall had made in them to cover the deduction of certain payments for interest charges which are no part of operating expenses, and adjustment of the federal tax and a few things of that kind; but this is substantially as the books show the income which they treated as income. But since their witnesses, as well as the City's, indicate a depreciation so that the *the* amount that has nominally gone into construction has not a value to it equal to that nominal amount by over $200,000 I built up in the fourth column a sufficient allowance to take care of that depreciation. In other words, I assumed that the Company's income was really not as great as appears in the third column and as would appear from their books, provided they had met the depreciation from year to year.

Q. As they went along?

A. Yes, as they went along. Therefore I have to take out from the income in order to get the last column the true net income, the amount that would be added to operating expenses and taken from the net income in order to get into the sinking fund at four per cent. Now it would not be necessary to deduct as much as this income if we assume that they find a more profitable investment for their depreciation reserve than four per cent, and they probably would; they could either put it in a five per cent of their own or other good companies or into a plant where they could earn this; so that it would as a matter of actual business history and common experience, it would not be necessary to set aside as much for depreciation yearly, I think, in order to reach the same total of $240,000 at the close. But since there can be no dispute that it could earn 4% anyway without trouble, I have adopted the 4%, although I
3723 believe I would have been justified in taking 5%.

Q. What would have been the effect of the final outcome of the fourth column here if you had accepted a higher rate?

A. I have not computed it.

Q. Would it have resulted in a larger net income?

A. It would. The additions that go into the sinking fund each year are the 1.289 per cent of the net investment which was explained in a previous table and work out there, on page 27 the net investment was given, including depreciation, and on page 24 the net investment was treated further, and on page 21 perhaps appears the table most important in interpreting page 43.

Q. Now, if I understand you correctly, if I understand this table correctly as it appears on page 43, beginning under date March 1, 1906, the gross revenue from the business of the Des Moines Gas Company was $390,833?

A. Yes.

Q. The gross operating expenses for the same period were $252,218?

A. Yes.

Q. Income over operating expenses $138,615?

A. Yes.

Q. Deduction for sinking fund purposes to cover depreciation $13,186.95.

A. Yes.

Q. Net income $125,428.05?

A. Yes.

Q. Then pursuing the same method the table, if I understand it, shows a net income for the year ending with 1908, of $147,607.16; and the year ending 1908 to 1909 $174,172.64; the period between March 1st and December 31st, 1909, $134,811.53; and the year ending with December 31, 1910 $170,618.40, is that correct?

A. That is correct.

3724 Q. To go a little farther with this table, worked out upon the plan you have adopted here, what does this $170,618.40 represent?

A. It represents the income from operation that can be divided in the dividends and interest and still leave the plant investment intact.

Q. In other words, that amount can be taken out of that year's business, divided among the stockholders without affecting the capital?

The MASTER: Right there let me ask a question. What was that amount that you gave you figured depreciation on?

A. It was 1.289 per cent. That is the amount necessary to put into the 4% sinking fund to redeem the principal in the period taken. I use this on page 21 in the table there which became the basis for this table.

Q. The figures are found too on page 23?

A. Page 24 rather, the previous table right through, 21 and 24 particularly.

Q. Now, the table on page 45 of your report, Mr. Bemis, what is that and where do you get it?

A. That is from Mr. Pratt's affidavit as here repeated verbatim.

Q. That has been referred to heretofore as having been filed in this court in the trial involving the Capital City Gas Light Company?

A. In the text here I state, however, that the totals at the bottom are mine. I made those totals merely to show what the average rate of profit was on the cash invested in that table.

Q. In the table made up by Colonel Pratt the totals were not carried out?

A. The last column was carried out, but the totals were not, no.

3725 The MASTER: But there is no depreciation?

A. I think I said yesterday the testimony indicated that they had not charged anything for depreciation; whether their maintenance and renewal account was sufficient to take care of it is not stated. I do not believe it was sufficient, although the testimony given at the time by Mr. Clark, Mr. Cowdry, Mr. White and Mr.

Pratt himself was to the effect that the property could not be duplicated for less than this sum; but they seemed to assume a new plant.

The MASTER: That would leave the average there to be reduced by that percentage 1.289 and would make the average percentage 5.52?

A. Yes, it would be 1.289, practically 1.290 taken from 6.81 would be 5.52. The Company, however, is given the full allowance of $466,000 in the net investment in the computations I gave and Mr. Hall gave, so that the Company is allowed a return on the full investment and not on a depreciated investment as was left at the close of 1894.

Q. So that for the purpose of this case and as made up from your computation the result would be the same?

A. I won't say it exactly; I have not computed it, but the result would not be as great a discrepancy as appears from that figure, because if you started your computations in 1895, that sum figured less than the investment shown here. To allow for depreciation at that time then the profit since then would be correspondingly increased, so that the net result of a change to harmonize with my belief on the early theory of depreciation, or early history of depreciation, would lessen the profits the first few years before 1895, and increase the rate of profit since then, but I did not make that change, because
3726 I had no real authority for making that assumption as to that testimony before 1895.

Q. At the bottom of page 43 there is a little error in subtraction. The last two items, the subtraction made between the third and fourth column. The third column figures are $192,108; the other $21,490.40?

A. $170,617.60 instead of 618.40.

Q. Which would be 68 cents?

A. $170,617.60 instead of $170,618.40, a difference of 80 cents, I think.

Q. What is the figure in the third column of your report?

A. It is $192,108.

The MASTER: Do you reject in that the $5,621, and the $10,000 of increase of salaries?

A. Nothing is rejected of that character in that computation I believe, except possibly the rate regulation expense; but not the $10,000 increase of salary.

Q. I notice on page 42 you have an explanation there as to what you put in and what you leave out—rate litigation expense $9,305, in 1895?

A. Yes.

Q. And then you include the accident item of $3,689?

A. Yes, I think there I leave everything in; I think I did. The correction then at the bottom of page 43 is only a small one and instead of 170,618.40 it would be 170,618.60.

Q. Before we leave this item, having in mind the suggestion of the Master, that the ten thousand dollars salaries, and the five thousand dollar rate expense, I wish you would turn—there is a table there showing the actual gross revenue without taking out anything, and the actual operating expense as shown by the books without
3727 subtracting that $10,000 and let us see if it is out. I think $192,108. is just what is shown in Hagenah's report there.

Mr. Hall was asked to make up a statement showing just what the books showed without his changes or modification?

A. Mr. Hagenah, I find in Exhibit 26, gives operating expenses for the last year $353,600. I think that difference was made up of the allowance for interest and a few other things not connected with the $10,000 of increase in salaries, and the $9,000 litigation expense, whatever it was. I used the same figures Mr. Hall used on page 19 for this last year and I am quite clear in my mind that when I prepared this I had before me the full operating expense with no changes from Hagenah, except interest allowances and one or two slight matters of that kind. The salaries were allowed to remain in that computation. But I can verify that this noon.

Q. I wish you would look that up and verify it?

A. I will.

Q. What page on Mr. Hall's report was it you referred to just a moment ago?

A. One reference is at page 19.

Q. Now on page 7 of Mr. Hall's report, I call your attention to that page Mr. Master, in response to your question there, there is a table made up showing, as Mr. Hall said, what the books show before any adjustment, and that shows as he stated it, the net revenue available for interest and other charges $192,107.65?

A. That is the same figure as I have.

Q. Now what do you have to say as to whether or not anything is left out or that $10,000 salary item or the $5,000 and some dollars replacement?

3728 A. All that and all the donations and everything is in. The only thing excluded was some payments for interest, and some adjustments may have been made, I am not sure in regard to the federal tax.

Q. So that the figure then $170,617.60 in the table at page 43 would represent the net income of the Company based on the books as Hall finds them, with a depreciation figure out on a sinking fund basis, as you have it?

A. Yes, sir; exactly.

Q. On page 47, will you explain what that table represents and how you arrived at the figures that appear there?

A. That represents in like manner the conditions since 1894 as they were given in Mr. Pratt's table for the previous period, only now depreciation has been taken out of the net income, or out of the nominal net income, to give the true net income. Of course in order that I might be exactly exact, I would have to change that last line now, of 170,618.40 to 170,617.60 but that is too small I think and had better let it stay as it would change the footing and everything.

Q. Now, Professor, I wish you would, for our benefit, and to have the matter in the record from you, state just how the operations of the Company would work out upon the basis of the Pratt statement and affidavit, and the operations of the Company since March 1, 1906, with the sinking fund reserve taken out, as you have taken it out in the former table, give the figures and return that the Company would receive on that basis, or has received on that basis.

A. During the period from January 1, 1895 until February 28,

1906, there would have been an average rate return of 8.187 per cent on the investment, the average investment of each year.

3729 If, however, we had made an allowance for depreciation in the earlier period before 1895, it would have left that return some less. This return would have been greater because it would have been reckoned on a smaller investment.

Q. Beginning with March 1, 1906, I wish you would give us the figures?

A. Beginning with March 1st, 1906, the first year, to March 1st, 1907, the investment with the working capital and after deducting depreciation was $1,311,524. The net income after setting aside a depreciation fund $125,428.05, leaving a percentage of return of 9.56 per cent. During the next year, ending March 1st, 1908, the investment would have been $1,384,163; the net income, after deducting for depreciation, putting that into a separate fund, $147,607.16, or an average return of 10.66 per cent. The next year ending March 1st, 1909, the investment would have been $1,403,081, and the net income, $174,172.64, and the rate 12.41 per cent. The next ten month- from March 1st to December 31, 1909, the investment would be $1,473,181, and the net income for the ten month- $134,811.57, or at the rate of 10.98 per cent. That rate of return is equivalent to a return on five-sixth- of the capital for the whole year. Again, the last year, 1910, the investment is $1,566,865, and the net income $170,618.40 and the per cent 10.89. The average return for the period of 10.92 per cent. Before I leave this page, I would like to call attention to the point I was referring to yesterday on the chart of Mr. Hall. He puts in that new holder in the year 1906 on March 1st. That brings down the rate of return on the investment for that year to about 9 per cent, while in 1904 and 1905 it had been 13.

If however the holder had been put in in 1903 and 1904,

3730 probably going into use in 1904, as the inventory states and as Mr. Lea states in his Exhibit, then the revenue would have been somewhat less in 1904 and 1905, the rate of return would have been somewhat less and that would have pulled down the average per cent. On the other hand there would not have been this apparent irregularity of fluctuation in the rate of profit which appears in this table.

Q. That is between 1906, 1907 and 1908?

A. Yes.

Q. Now on page 48 of Exhibit 43, I wish you would explain the matter that appears there?

A. I there show what the average profit has been for the three periods grouped into one period.

Q. Just explain that?

A. I take the totals of each of the three periods and add them together, the total profits for the first period $371,450, according to Mr. Pratt. The second period as given in previous tables $655,598.; the third period $795,618, since March 1, 1906.

Q. What result do you reach by that method as to the rate of return, covering the entire period?

A. 9.15 per cent.

The MASTER: The first period has not got depreciation?

A. The depreciation has not been taken out. That will show just what I was referring to a few moments ago. If the depreciation had been omitted then 6.81 would have somewhat fallen, a cent or perhaps 1.3 per cent. On the other hand, the sum of the actual investment would have fallen, the rest being in the sinking fund, then the total sum of the investments given here $19,443,222. would
3731 have been reduced and the rate per cent would not have been probably much affected; whether it would have been slightly increased or decreased I wouldn't want to say off-hand; but it would not have been much affected either way.

Q. What do you have to say; you say it would not have been much affected?

A. Not more than one-tenth of one per cent.

Q. Would it be safe to say it would not wipe out .15?

A. Yes. Of course it is fair to the Company to say that a small return in that earlier period might be considered as somewhat more important than a smaller recently, if you are going to compound a return; but it is not customary to compound in that way, even preferred stock dividends. If you get what you have originally been promised in some form that is cumulative, you do not generally get interest on it also. Furthermore it appears to me that as handled here, giving them the full benefit of what they claim the first of January, 1895, is quite a fair method of treatment. In other words, let them have, as I put it here, the investment as they computed it without taking depreciation out and give them interest and profits on it up to date.

Q. And in that way you worked out the conclusion that is found here on page 48?

A. Yes.

Q. Now at the bottom of page 48 you say something about dividends; I wish you would enlarge upon that a little and state into the record what you have to say about it?

A. The dividends paid prior to 1895 and the interest was very small, and since then likewise. The interest had been paid right along on all the bonds, the dividends were small and scarcely have there been any since 1894, I believe. But the bonds bearing
3732 6% for quite a while and now 5%, together with the net earnings appear to have paid for the plant. As I stated here the $800,000 preferred stock contracts bearing 6% issued in 1906 and accumulated surplus today of over $300,000. has been the equivalent of good dividends on the property from the start, so far as not paid for by outstanding bonds. On March — 1906 these bonds amounted to $685,000 bearing 5% interest, and the preferred stock contracts at 6% issued then, amounted to $800,000 or a total of $1,485,000 interest bearing securities. As I figured it, the net investment at that time was only $1,027,802, which you will find on page 47 for that period.

Q. So that the dividends, whatever there were, if they may be called dividends, was included in the interest bearing securities that the stockholders of this company received?

A. Yes. There were $800,000 issued of 6% preferred stock contracts which did not represent any immediate investment in the plant, but appeared to cover the investment that had been made in the past out of the earnings. Since that already bore interest at 6% it was in a way a payment for dividends not received in the past.

Q. Now turning to page 50 of your report, do you there to some extent deal with the cost of reconstruction—on pages 50 51, 52 and 53—I wish you would give us the benefit of your judgment with respect to the cost of reconstruction?

A. The attempt is here made to fall back on the book statements about the cost of the property. On page 50 I state how Mr. Baehr estimates the cost new without overhead, of the works and office furniture as $504,891. The books had shown a little more than that $525,274. as the cost; and is a difference of only $20,000 or 4%.

3733 Q. This $504,891. that you use of Mr. Baehr's computations is without overhead charges?

A. I just said so here. It is what he calls his base figures. It includes as I understand it, some contractor's profits on machinery and apparatus furnished, but did not include what is generally known as overhead. Then as to the meters the books show a cost of $187,755.93. Mr. Baehr's estimate, without overhead charges, was $206,472. or about 21% more. There is a larger difference there than in any other items. On the two items, works and meters combined, the difference is largely neutralized. The books show a cost of $713,030, while Mr. Baehr has $711,363, a difference of only $1,700, or less than one-fourth of one per cent. It is a remarkable evidence of close approximation by Mr. Baehr I think, and confirms also, I think, the accuracy of the books and records and tends to estabilsh the fact that the over-head charge either was not as large as Mr. Baehr estimated or was paid for in operating expenses; probably something of both. It also confirms I think the position taken by the Wisconsin Commission that 12% is ample for over-head charges; at least that the larger amount by Mr. Baehr is too large.

The MASTER: Mr. Randolph's was 20%?

A. Yes.

Q. Now, the next is house and street lamp service?

A. The books show $284,129.60; Mr. Baehr gives the cost new with paving $375,453, but deducting the paving given by him $42,322. there remains for the service, independent, $33,131. His paving was 11.272 per cent of his total reproduction new value, and deducting this from his total overhead on services and paving of $83,433. there remains as the overhead properly apportioned

3734 services $74,028.43. The services then without overhead or paving estimated by Mr. Baehr at $259,102.57 or $25,000 or 9% less than the books show to have been the cost. This may indicate the discontinuance of some services or street lamps, or it may indicate that a very small portion of the services were laid under pavement originally.

Q. Now right at that point, is it possible to find those figures, the figures you have given here $259,102.57 without a careful working out of Mr. Baehr's tables and schedules?

A. I think one has to go through some such process as I have done here.

Q. The separation is not made in the report so that it can be ascertained without careful examination?

A. I didn't see any way getting at it except this way. This matter of services is along the same line as that of the meters and works already referred to. There is a remarkable uniformity between the book cost and Mr. Baehr's figures, when you get out his overhead and pavement.

Q. Did you take up Mr. Lea's figures and analyze them the same way?

A. Yes; I did not go into his figures quite as thoroughly because I did not have the time.

Q. What did you do?

A. He gave the investment of the last five years on services as 26.263 of the total investment if I understood his method of computation. Now the books show a cost new of services the past five years $74,263.59. Now if this is 28.263 per cent of the total investment it would show a cost on the basis of the last five years of construction $262,758.15 or only $3,000 more than Mr. Baehr's estimate without overhead and $22,000 less than the total book cost.

3735 Q. That is, his figures, if that percentage you worked out there is correct, would show $22,000 less valuation than the book cost?

A. Yes.

Q. Now, Professor Marks—did you take up his method?

A. He reached the conclusion that the buildings and contents, yard structures, in other words, the works, amounted to $482,639. new, or about 12% less than the books show to have been the cost of all that property, to-wit, $525,274, but if the stable equipments are added, and I think they should be, which he gave as $15,192. for these matters, then the difference is only about $28,000 or 5½%. Professor Marks included in his estimates all overhead. Some of the property included in the book cost has entirely disappeared, such as the first holder.

Q. I suppose there are numerous smaller items and apparatus down there that have disappeared?

A. Yes.

Q. Either by actually wearing out or obsolescence?

A. Where it has not disappeared as in the case of the old gas *gas* works, it has been so nearly scrapped that it practically has disappeared.

The MASTER: They eliminate these old gas works entirely?

A. Yes, but it has not been eliminated from the book cost.

Q. Now, Mr. Marks estimated the meters?

A. He estimated the meters new $220,000 or $33,000 more than the book cost, while his house and street lamp services he esti-

mated at $293,300 or $59,300 more than the books show. Combining the two items including his overhead—all his figures include overhead as far as he allowed it, it is $513,672, while the books show a cost of $471,885.53. So there is a very marked agree-
3736 ment all through between these figures.

Q. That is when you eliminate——

A. From Mr. Baehr's figures the overhead and paving. In case of street mains Professor Marks allowed $652,947. Mr. Hall finds the book cost $649,750. Mr. Baehr's estimate of $1,346,823. is reduced to $774,577.78 if we deduct his paving allowance of $350,939. and his overhead on the mains alone of $221,306.22.

Q. Does that figure $221,306.22 represent the overhead charges in Mr. Baehr's report on mains alone?

A. Yes.

Q. Does that figure appear in the report or did you have to work it out?

A. I had to work it out, if I recall; yet I think that does appear.

Q. Did you have it worked out carefully for you?

A. Where it appeared in his report I took it exactly as he had left it without any effort to work on it further.

Q. Now, will you proceed with your explanation of page 52?

A. I then attempted on the mains to take the unit costs of the last five years as given by Mr. Hall from the books and where he did not give any figures, as in the case of the smaller mains, three inch and under, I used Mr. Baehr's estimate of that without overhead or paving, and in that way taking the cost for everything above 3 inches, and of course that is nearly all the investment, I reached another set of figures of the cost of the mains on the basis of construction cost of the last five years and that is $654,150.65; and it would appear as if it were proper to apply such a method to the system if we did not take into account paving. The new mains doubtless were mostly laid before paving, as the old mains were.

Q. How does that total compare with the total book cost
3737 as found by Mr. Hall?

A. It is within $5,000 of it, less than one per cent. In other words, this total $654,150.65 or the duplication cost on the basis of the last five years is to be compared with $649,750.66 shown by Mr. Hall to have been the total cost of the mains. I put those all together in a table on page 54.

Q. Turn to page 54 and explain the table.

A. The first column of figures shows——

Q. Read them into the record.

A. Perhaps I had better read across. The meters shown by the books of the company cost $187,756. Professor Marks appraised them new at $220,298. Mr. Baehr appraised them new, omitting overhead charges, at $206,472. The duplication cost on the basis of the past five year prices is $206,997.

Q. Now as to services?

A. Perhaps I ought to stop there and say that I shall refer again to meters later as to how that figure was made up. As to services the books of the Company show $284,130. Professor Marks' appraisal

is $293,374. Mr. Baehr's base figures without paving or overhead, $259,103. On the basis of the last five years $262,758.

Q. Now as to mains?

A. As to mains, the book cost is $649,751. Professor Marks' appraisal $652,947. Mr. Baehr's base figures, without overhead or paving, $774,578. Duplication on the basis of the last five years' costs $654,151. That shows the total according to the books of the Company up to that time, aside from works and office $1,121,637. Professor Marks' appraisal was $1,196,619. Mr. Baehr's appraisal without overhead or paving, $1,240,153. Duplication on the
3738 basis of the last five years' cost $1,123,906. To my mind that is a very wonderful similarity between costs arrived at so independently.

Q. Now as to the works and office.

A. They are shown by the books as being $525,274. Professor Marks' appraisal $497,831. Mr. Baehr's, $504,891, without overhead and of course the land is not included in the works. No attempt was made to determine duplication costs on the basis of the last five years as it seemed to me there was not quite enough data at hand for that. The total is given therefore in the following way: Grand total, the books of the Company showed aside from land, $1,646,911. Professor Marks' appraisal $1,664,450. Mr. Baehr's appraisal, without land, paving or overhead, $1,745,044. There is no attempt to give any grand total.

Q. You did not attempt to carry out the works and office on the question of duplication for the last five years?

A. No.

Q. Now this table is explained further on page 55 of your report?

A. Yes.

Q. Is there anything further you desire to say with respect to the matter found on page 55 as to meters?

A. I introduced on page 55 a further analysis of how the meter duplication costs were obtained.

Q. I wish you would go through that for us?

A. I had started on my table, using the number of meters and each size given by Mr. Lea before I noticed there was a slight difference in the apportionment of the sizes between his table and Mr. Baehr's, but the total did not seem to vary, and the differences were too slight, so I adhered to Mr. Lea's table, although I did use in one case Mr. Baehr's figure. I did not use the number of meters
3739 given by Mr. Hall, because that seemed to include Valley Junction, probably included in the $45,000, but not all perhaps, but that was not included in the estimates of the others. Now the unit cost of meters—there is a mistake here where it says "are those not given" it should be "are those given".

Q. The word "not" should be stricken out?

A. Yes. The unit cost of meters employed are those given in Defendants' Exhibit 30, schedule 5, page 3, on page 55 of my report. There are certain meters, 66 meters of certain sizes where the unit cost were not given and I used Mr. Baehr's base figures. Now there comes something which I obtained in a different way.

Q. Explain that, please.

A. The unit cost did not include freight and day before yesterday, I think it was, I asked Mr. Sangster to go to the Company's office and see what he could find as to recent freight consignments and costs. And he came back with certain figures that seemed to compute about 40 cents on certain consignments, and I took 45 cents. Then locks, as to prepayment and standard meters seemed from the books to be $1.50; I think it is high. I think it is possible to set six or eight meters a day easily and the material necessary to go with it, I should think should bring the setting down to a dollar. But I allowed the figure of $1.50 because I didn't want to err on the side of being too low. I reached the unit cost for each size of meters as on an average of $1.95 for freight and setting. Of course it would be more than that in the very large sizes, and less in the smaller. In the case of prepayment meters fifteen cents is added for locks etc. These unit costs were applied to all the meters, and 853 are in stock and
3740 strictly speaking the cost of setting should not have been applied. That gave a further increase of $1,300, so that the figure $206,997. for meters based on the prices of the last five years appears to me a little high, approached in this way; yet there is an agreement with Mr. Baehr's figures so close that it may indicate on the whole, the figures of the two being so near together, may be correct, although at first I was inclined to believe that it was a little high for setting, and this allowance for meters in stock should not of course have been allowed.

Q. On page 56 is a table showing just how you arrived at your total?

A. Yes, that is merely a summary of the application of the unit costs to the meters.

Q. On page 57 you deal with services?

A. I deal with that as I previously explained; that is rather a repetition.

Q. On page 28 you deal with wrought iron pipe, I wish you would explain that table to the Master and just what is covered by the table in the center of the page?

A. On all sizes except 3 inch and under, and 14 inch, the book costs are given.

Q. That is on page 58 of the report?

A. Yes. There is a typographical error in repeating the figure 45.30 unit cost per foot; it belongs opposite the 4 inch, if any figures put in there under the 3 inch.

Q. That is, the first 45.30 should come out?

A. And 36.01 should be substituted. It does not change the total. It is only a unit cost per foot. That unit cost per foot was obtained by reversed prices. The first line is not obtained by Mr. Hall.
3741 It is obtained by taking Mr. Baehr's total and divide it by the total number of feet.

Q. And this table shows how you worked out the final result $654,-150.65, the figures that you have used in your former tables and in your testimony up to this time?

A. It is entirely based upon Mr. Hall's report as to the unit costs per foot during the last five years, with the exception of the first line.

There were no 14 inch unit costs given; there were only 622 feet of it, and I applied to it the unit cost for 16 inch.

Q. I note on that page you refer to the number of feet of pipe that is still without any paving over it?

A. Yes.

Q. And you give the number of feet as 522,110.

A. Yes; those figures I have here, they are not very different from the figures that the Judge recalled yesterday as having been given by Mr. Moul. I think the percentage would work out just about as stated yesterday.

Q. Now on pages 59 and 60 are found some comparisons of investment costs which are self-explanatory, are they not?

A. I believe they are. I wish to make the point merely that there was no selection of companies but every company was taken above a certain size. There are seven companies next in size to Boston which were taken.

Q. Take the matter that appears on page 60 and let us know what you worked out of the table as it appears there?

A. The sales were given——

Q. Take Cambridge for instance, and the figures following that name represent the sales in feet of gas?

A. For the last year for which we have any reports.

Q. And the next column, what does that represent?

3742 A. The amount of assets reported by the Company to the State Commission.

Q. And the same explanation would follow the figures as to Fall River, Springfield, Worcester, etc.?

A. Yes.

Q. And the total of $3,968,475.62 represents the sum of the sales in those towns?

A. Yes.

Q. And $13,964,600. the sum of the assets of the Gas Company?

A. Yes.

Q. Out of that, what average do you find per thousand feet?

A. $3.52 per thousand feet.

Q. How would those figures compare, and what application would you make of them to the Des Moines situation?

Objected to on part of complainant for the further reason that this is incompetent for the purpose of showing costs in Des Moines and being a comparison with the situation here and the alleged statements in some published reports, which certainly cannot be a proper basis for determining the value here. We ask that this objection shall apply to everything relating to the Massachusetts reports and also other statistical matters taken from various sources and set out here.

The MASTER: The same order is made as to the objections heretofore made.

A. The Des Moines Company, if it had the same assets per thousand feet sales as the average of those seven Massachusetts companies, would have $1,872,608.

Q. As worked out from a comparison of these Massachusetts Companies?

3743 A. Yes. If we take, however, Fall River, the only exclusively water gas plant, the assets there 2.90 this would be $1,542,774. for Des Moines.

Q. All you claim for this, as I understand it, Professor, whatever it is worth as a matter of comparison?

A. It is set out here and it is stated at the close that it is not conclusive, but I think it is a comparison of some use and help.

Q. On page 61 you deal with the operating expense and have set out some figures and tables, I wish you would explain?

Mr. GUERNSEY: We make the further objection to the testimony as to operating expenses, and applicable to each portion of the testimony, that it does not appear that the witness is competent, because it does not appears he ever had any practical experience in the operation of any gas plant.

The MASTER: The same order is made with reference to the application of this objection as heretofore.

A. The operating expenses are next taken up, and first the manufacturing cost, or the cost of gas in the holder, which is 29.75 cents per thousand feet in 1910; per thousand feet made, or 31.1 per thousand feet sold. The difference, 1.35 cents is due to leakage and unaccounted for gas.

Q. What did you find with respect to this manufacturing expense from your examination and investigation here as to whether they were rising or falling or had in the past been rising or falling?

A. In the table at the bottom of the page, 61, I compared 1910 with the average of the previous four years and show that the repairs were considerably higher in 1910; they were abnormally high. It
3744 is further proven by a fact not mentioned here, that Mr. Baehr in his estimates of the future manufacture of the plant have lower repairs.

Q. Oil had fallen in 1910 to 4.26 cents; that is, it was that much below the average for the four years?

A. Yes, there has been a large fall all over the country, especially in the west since the new wells in Oklahoma, Indian Territory, Kansas, Mexico and Texas. The other expenses have fallen slightly.

Q. The manufacturing expense, as distinguished from other expenses, what do you have to say as to whether or not they have been steadily going down?

A. They have been steadily going down; the expense of labor, coal, boiler fuel and generator fuel have been slightly falling; so that the cost as a whole in 1910 was lower than the previous four years, and that had not been noticed for the first time then; there had been previous experience which I give further down the page. There is a statement here in the middle of page 62 that should be slightly added to. I stated here, if we go back to 1904, and I should say to 1904 and 1905.

Q. The figures 1905 should be added there?

A. Yes, if we go back to 1904 and 1905 we find the total manufacturing cost was 42.25 and 39.28 respectively per thousand feet of gas made, and somewhat more per thousand feet of gas sold. If we go further back to the only other point of which I have infor-

mation, 1891 to 1894 inclusive, then the figure was 51.6 per thousand feet sold. So we have a decline from 51.6 in that four years to about 40 cents in the two years 1904 and 1905, 34 cents in the next four years and 29.76 cents in 1910.

Q. What does that indicate as to the cost in the holder,
3745 whether it increases or decreases as the sales of gas increase?

A. With the sales of gas and the improvement in the art which is being made, there is this tendency to decline in cost, which is endorsed, I notice, by Mr. Lea in his estimates in the next six years, which I refer to on page 62; he gives a slight decline.

Q. Turning to page 63, you have set out there some statistics showing the percentage of unaccounted for gas in numerous cities and towns?

A. Yes.

Q. What did you find the percentage of leakage to be here in Des Moines of unaccounted for gas?

A. The Company's witnesses gave it as 4.31 per cent and spoke of it as being lower than any other cities, most other cities in Massachusetts. They referred to many of these same cities and the same reports from which I took these figures.

Q. What did you find the average to be?

A. Well the average of the rates of these eleven cities was 4.28.

Q. Net rates?

A. The rates of leakage unaccounted for. About the same, just a trifle less than Des Moines.

Q. Now, Professor Bemis, turning again to defendants' Exhibit 43, your report, page 64, you deal with operating expenses other than manufacture and leakage?

A. Yes.

Q. On pages 64 and 65 is there anything on there that is not self-explanatory?

A. I think not.

Q. Then we will go to page 66; you deal on page 66 with donations and bad debts. There is nothing there but what could
3746 be readily understood?

A. I think so.

Q. On page 67 you deal with rate litigation expenses; what do you have to say whether you set forth there your views with respect to allowing that sort of an item to be included in investment or value for the purpose of rate making?

A. Yes, I do.

Q. At the top of page 67 the year 1909 should have been 1911, in the sentence "the city of Des Moines fixing rates for 1909 and subsequently", that should be 1911?

A. Yes.

Q. Now on page 69 you deal with expenses other than manufacture and leakage and show what you term to be an abnormal condition for 1910?

A. Yes.

Q. And the matter appearing on that page is fully explanatory?

A. Yes.

Q. The same is true of page 70?

A. Yes.

Q. Now on page 71 you deal with the profits of the Des Moines Gas Company at 90 cents. I wish you would state briefly just what you worked out on pages 71 and 72 and the rate of return you find under the 90 cent rate and how you get at it.

A. At the bottom of the page the matter is summarized——

Q. I wish you would state that into the record.

A. Following Mr. Hall's computations of net revenue on the basis of the manufacture cost and leakage of 1910 but on a four year basis in one column there being four years prior to 1910; on a five year basis in the second column, which includes 1910, for all costs
3747 excepting manufacture and leakage. The first line, the net revenue $145,173.06 on the four year basis; and $135,863.22 on the five year basis.

Q. I notice you add a figure for adjustment; I wish you would state where you got that figure?

A. That I add for adjustment to the net revenue as estimated by Mr. Hall $7,237.01 on the four year basis, and the same amount on the five year basis, making a total of $152,410. on the four year basis and $143,100. on the five year basis. The adjustment comes from three facts or three changes. The accident claims and expense on account of accidents are increased above the average of the period as given by Mr. Hall to include the payment of the accident claim in the first two months of 1906 for some claims accruing before that, and the amount that is thus added is .16 of a cent on the average sales of the entire period; and the taxes are increased by .44 of a cent to cover the fact that the taxes in 1910 are higher than the average before that for the previous four or five years; not higher than it had been at one time, and that made an addition of $2,340.76 for the one year, and the total increase of expense, $3,191.95.

Q. Is that the addition to the expense?

A. That is the addition. On the other hand the depreciation allowance is reduced from six cents a thousand feet to the amount found necessary for the sinking fund, which was substantially four cents in the last year. It would have been higher in some earlier years per thousand feet of sales. Taking the exact figure from my own previous table $21,490.40 instead of Mr. Hall's figure $31,919.46 there remains a net reduction of the depreciation allowance of $10,-429.06.

Q. That would represent the additions?

3748 A. That would represent the addition to revenue.

Q. Rather the reduction?

A. So the net reduction in expense from this readjustment is $7,237.01 and that is added to the net revenue, and as the expenses become reduced the net revenue correspondingly increased.

Q. Those totals upon your method would work out what return?

A. On the investment of $1,566,865. it would work out on the four year basis 9.61 per cent, and on the five year basis 9.13 per cent. Then I show that those profits would be 8% on the four year basis on $1,905,126. and on the five year basis it would be 8% on $1,788,753 and show that on other percentages; what it would be or

what it would show at 7% on $2,191,572. on the four year basis, and 7% on $2,044,289 on a five year basis, and 6% on $2,540,168 on a four year basis, and 6% on $2,385,004. on a five year basis. The profit per thousand feet of sales of 1910 is 28.65 per thousand feet, on the four year basis; 26.9 on the five year basis. In the parenthesis at the last line I see the figure, for sales was given 531,991. and it should be instead 996.

Q. Did you have any time, Professor, to check up this typewritten part before we called you here?

A. No, it was finished about breakfast time yesterday morning and I had not read it over last night. I was tired and I did not check it over then. In fact I did not read it last night.

Q. What do you have to say as to whether or not, taking the four years, leaving out the year 1910, and then adding to it two prior years, whether the averages run along so as to indicate to you that the four years would cover a period of operations that was normal?

A. The four years prior to 1910 are very much like the
3749 six years prior to 1910 in all matters outside of manufacturing, leakage and taxes. While the six years are about the same in these respects in distribution in general and all these expenses we are now talking about.

Q. On page 72, the second paragraph, you deal with the increase in the value of the land and work out what you claim to be the proper method if an increase in land is to be allowed?

A. Yes.

Q. And show the increase should be added to the revenue as earnings of the company?

A. Yes.

Q. And the matter is self-explanatory?

A. I think so.

Q. On pages 73, 74 and 75 you deal with the market return on bonds. I wish you would state briefly just what conclusion you reach from these quotations?

A. I used the quotations at the time I made this up, which was when I was here before and in my stay in Chicago afterwards. I took the first week in August and took the Commercial Financial Chronicle, the bank and quotation section in that period, and perhaps in a few cases supplemented it with what I could find in the Progressive Age, but practically everything came from the Financial Chronicle.

The MASTER: I do not see any Iowa companies here?

A. I gave every five per cent bond I found of an artificial gas company. Des Moines being represented through the United Gas Improvement Company, their bonds are not on the market, owned by the U. G. I. As to other companies they are probably small and not quoted on the stock market; they may be locally quoted.

3750 Q. You quoted everything you could find?

A. I believe I included everything; I aimed to do so. I stated here that I omitted one company on page 75; that is Toledo, because of exception- conditions, owing to its street railway portion of the investment, has brought down the rest. There are 97 companies represented; 125 securities, 5% bonds, and the average quo-

tation was 97.6 per cent. I can file with the testimony, if you wish, that copy of the Commercial and Financial Chronicle.

Q. Now on pages 76 and 77 you deal with these bond issues and market quotations, and the matter set out on page- 76 and 77 is self-explanatory, is it?

A. Probably.

Q. I wish, if you care to say anything about it, you would?

A. I don't know that it is necessary.

Q. From your examination of these quotations and basing your answer on your experience in the numerous cases you have referred to, and upon your general experience over the years that you have observed the stock markets and investment in stocks and bonds, about what rate of return is usually received by the holder of stocks and bonds in a fairly profitable business?

Mr. GUERNSEY: I want to make the further objection to that because it is irrelevant and immaterial, and because it is not limited to the gas business; further it is incompetent because it asks the witness to determine one of the ultimate legal propositions involved here; and further it is incompetent because it does not appear that he knows.

The MASTER: The same order is made as to the objections heretofore made.

3751 A. I have had occasion in other cases to make similar tabulations and the results were not strikingly different. In other words, 5% gas bonds are usually selling in the market—I have given here the prices bid not prices asked—at a very slight discount. They usually run from 95 to 100.

Q. How about stocks of gas companies and other similar companies; what is the usual rate of return as shown by these quotations and as you know from your experience with stocks and bonds upon the stock that is considered and used as the basis for arriving at the par value of the stock?

Complainant interposes the same objection last above made.

A. I have in the same way frequently tabulated in the last ten years the return to the investor buying at current quotations stocks and sales of bonds of gas companies, and it is rare that you can go into the market and do better than a 6% return on stock, or 5% on bonds. There may be a 3% discount there.

Q. Take the financial market, if that is a proper term, and for a period covering recent years, the last two or three years, take a gas company's stock, or a similar public service corporation, that is earning a net return of say 6%, what would be the value of the stock as fixed by the stock market and by men generally who deal in stocks?

Complainant interposes the same objection last above made.

A. You mean net return to the investor?

Q. Yes, sir.

A. He will not usually be able to do better than a 6% investment.

Q. Suppose you were fixing the value of an investment in a share

of stock for the purpose of quotations and you should ascertain as the basis of your judgment as to its value that the property, the plant was earning a net return of 6% on that stock, what
3752 valuation would you give to the stock?

A. If the probability was that would be paid out, if it were a dividend paying property and then if the dividends were pretty certain to remain at 6%, it would be rather difficult to pick it up at par. If, however, the dividends ultimately increased to seven the par value, the market value would correspondingly rise.

Q. In other words, if I understand you, a share of stock that is earning in one of these public service corporations anywhere in this country, produces a net return to the holder of 6%, is quoted and ought to be quoted on the market at at least par?

A. As a matter of fact it is quoted at par.

Q. Now take a case, if you were going to make up a market quotation for the use of the public, or if you were going to ascertain the value of a share of stock for an investor who had employed you to ascertain the value and you found that the stock in the particular plant or corporation was earning a return of five per cent on par, what would you say as to that share of stock on the market and what the quotation ought to be and what would you quote it at?

A. Of course, in this as in some other questions you ask, you couldn't really answer fully without taking into account one or two other factors. One would be whether the stock and bonds were sufficiently near to the physical value of the property, so that in any question that might come up, of rate regulation, the company could show its real investment was about up to these securities, and therefore that the rate would not fall, probably below a return on the investment; another question would be whether the company had been paying these dividends for some time and was likely to continue to do so.

3753 Q. What I am trying to get at in my awkward way, is the per cent of return that investors generally throughout the country accept and do receive upon their money invested in the stock of public service corporations, in order to fix a par value in the judgment of the investor and the stock market makers and all that sort of thing?

A. I should say about 6%.

Q. And what do you have to say as to the effect upon the general market value of a stock or shares of stock upon which there is a regular and continued return of over 6% covering a period of years?

A. It usually sells at a premium.

Q. That is to say, the effect of that condition would be to increase the value of the stock above par?

A. Yes.

Q. Do you know of any class of securities, either stocks, bonds or mortgages or other evidences of indebtedness of service corporations or any other character of institutions where more than a six per cent return is expected and received continuously?

A. Why there are companies that are paying dividends in excess of 6% and the stock in these cases is usually much above par.

Q. And the investment is correspondingly larger?

A. Yes.

Q. That is to say, for every dollar you go above par the holder of the stock on the theory of the stock investments has that much more of an investment in the property?

A. For example, the Massachusetts Commission has under the law to pass upon all these securities, and they fix the price at which the stockholder can take the stock and the bond, and if he does not take it at this price, it must be sold on the market. The price is
3754 on the basis of 6%.

Q. There are numerous states now in the Union, are there not, where the state has undertaken to regulate the issuance and sale of stocks and to regulate the return that may be received upon the stocks?

A. Yes.

Q. Do you know any such cases where the rate of return is figured above or allowed above 6%.

A. I don't think of any. I am thinking just now of another case in Toronto. There they allow and pay 10%, but all their stock must be sold in the open market at auction, and it is selling at 1.90 to 2.00; so that the investor only gets out of it five to six per cent. A very thorough investigation was made in Cleveland and the stock was fixed at 6% and never can exceed that. The fares can be adjusted in certain limits and not to exceed four cents. These 6% stocks are now selling at about 100 or 100 and a quarter.

Mr. GUERNSEY: You mean stock in the Cleveland Street Railway?

A. Yes.

Q. Is there any such regulation in Cleveland or any other cities you know of as to the rate of return upon bank stocks?

A. No.

Q. As to how much a man may make on his stock in banks?

A. No.

Q. Or any manufacturing establishments like the Casket Company that makes the coffins we talked about here in the beginning of this hearing?

A. The fact is these public securities, they are accompanied with certain, more or less practical guaranties against competition,
3755 and that the rate shall be sufficient for a fair return on the actual investment. There is no, perhaps absolutely legal guaranty; there is pretty nearly that in the tendencies of to-day.

Q. When you use the term guaranty do you refer to actual personal or written guaranty, or to a guaranty of conditions, or rather conditions making the guaranty?

A. Conditions, and the tendency of public thought. The tendency of thought in the country is against competition in these things, tearing up streets is becoming such a nuisance—that is another protection to a company.

Q. For instance, you take the Gas Company here; the undisputed record in this case shows that it already has laid under the streets of this city 180 odd miles of mains and almost half of it, as you have shown, and I think is undisputed, under pavements; so that to lay

new mains, for a new company to come here and do that by going through the present pavement, isn't that a condition that amounts to a guaranty almost against competition?

Mr. GUERNSEY: We further object to this question on the ground that it is not a matter of expert testimony, but a pure matter of argument, and is not something upon which any witness could properly testify.

The MASTER: I think that is wholly for the court. But I am perfectly willing to hear his opinion about it.

A. Well, I believe it in a protection to a company, a very large protection.

Q. And was that one of the things you had in your mind when you used the term guaranty?

A. I stated it here somewhere in the report, and I think I mentioned it as not a legal guaranty but a practical guaranty; no
3756 legal guaranty in most states; in a few there may be. The tendency of thought is altogether against competition and rather the tendency is to regulate rates rather than establish rival companies. That is one reason I think why those securities are quoted as they are in the market and that there is a certain degree of stability to these companies.

Q. The matter on page- 78, 79, 80, 81, 82, 83 and 84 covers quite generally what we have just covered?

A. Yes; I think on top of page 81 there is a table that might be noticed.

Q. I wish you would explain that table, what it represents?

A. A 5% bond is generally preferred by the companies, even if it sells at a slight discount, than a 5–1/4% bond which would sell at par or a 5–1/2% bond. Yet that is no reason why we can not reckon a return on our bonds. But doing it in a different way as I have illustrated in this table—assuming for the moment bonds are selling at 93, 5% bonds, and 6% stock at 93, although the average of these bond quotations was 97–1/2, but I assume there are some expenses necessary with the bonding company in floating them, and the difference between 93 and 97–1/2 would cover probably all those expenses; so that we may take 93 as a return to the company, although this company has the last two years, the return of 5% bonds, quoted at 95. Taking 93 here as the basis for the bonds, and 93 also for the stock, as I have it, the interest at 5% on the par value of say $100,000 bonds is $5,000; the annual dividend of 6% par value of stock, $6,000; the annual additions to the sinking fund required to redeem $14,000 in thirty years, assuming that to be the life of the bonds, $250 in the 4% sinking fund—total charges on the cash investment of $186,000 $11,250; per cent of burden
3757 on $186,000, 6.05. In other words, that is precisely the same thing to the company as if it issued 6% securities at par leaving out .05 of one per cent. On page 83 the third paragraph the year 1901 as used there should be 1911. I did not have time to go over that. On that same page there is a date, 1804, which should of course be 1904 in the last paragraph.

Q. And 1808 should be 1908?

A. Yes.

Q. Now, on page 82, the middle of the page is a table which I wish you would state what it represents and where you got the basis for these figures and the information with respect to them?

A. As stated in the text, that came from the Commercial and Financial Chronicle and the Progressive Age.

Q. What is the Progressive Age?

A. That is one of two gas journals of the country having been devoted for twenty or thirty years to technical information on gas.

Q. What does this table represent as set out here?

Mr. GUERNSEY: We object to this for the further reason that this table appears to be quoted and the witness should hardly be asked to explain what was in the mind of the person who wrote it.

Q. I want you to state what it represents in your report and what you claim for it?

A. In my report I assume a 6% gas stock could be sold at 93. A stock that would net the investor, in other words, a little over 6%. But here are six of the leading gas companies of the United States, including the United Gas Improvement Company, where according to this editorial in the Progressive Age the investor is getting less than 5% who buys in the stock market today. I use a figure higher than that and more conservative.

At this time an adjournment was taken until 1:30 P. M.

3758 1.30 P. M., THURSDAY, *September* 21, 1911.

EDWARD W. BEMIS being continued on direct examination by Hon. H. Byers, testified as follows:

Q. Calling your attention Prof. Bemis to first the table found on page 43, you remember there was a correction made in the figures at the bottom of the last column of the table?

A. Yes.

Q. Now since adjournment what errors have you found in the totals in the tables on page 47 and 48 and what corrections if any have been made?

A. On page 47 the last line before the final total I think had better be changed to the exact figure that we have just noticed on page 43 in other words to $170,617.60. Then the total of that group since March 1, 1906, in other words, the final total on the page should be changed in this way, the first column which now appears in the record and the report as $6,893,284 should be $7,138,814. The next column, $752,637.82 and the last column 10.54 per cent. That will mean the same changes at the top of the next page to harmonize with those just made. The third line of the table where it is now, $6,893,284.00 should be changed on the previous page to read $7,138,814, the second column third line likewise should be changed to harmonize with the previous page to read $752,638, the third column should be changed to read 10.54 per cent as on the

previous page and then the totals and average should be changed so that the first column instead of reading $19,443,222 should read $19,688,752, the sum of the profits should read $1,779,686 and the per cent should be 9.04. That is referred to, these per-
3759 centages are referred to in the next paragraph and therefore in the last full line of the next paragraph at the middle of the page should read which has bee- 10.54 or an average of 9.04 throughout the thirty four years to harmonize in other words with the table. 10.54 per cent pr an average of 9.04.

Q. In the first paragraph of the written portion of the page——

A. The last line beginning with the words months it has been, change the figure to read 10.54.

Q. Instead of 10.92?

A. Yes, or an average of 9.04 where it now reads 9.15. In other words to harmonize with the table.

Q. Wherever that same computation appears the same correction should be made if we have not already made it.

A. Yes. I should like to show on top of page 81 what would happen if the stock and bonds could only be floated at ninety.

Q. Do that please.

A. Then the first line and second line would remain as they are top of page 81, but the third line would require an addition to the sinking fund to redeem which would now be $20,000, 10 points on stock and ten points on the bonds, it would require $358.00 on that basis instead of $250 on the basis of 93. Then the total annual charges would be $11,358 and that would be on a cash investment of $180,000 if ninety was realized on the stock and ninety on the bonds and that means a percentage of 6.3.

Q. I don't quite follow you to get the eight on the $358?

A. That is the annual additions to the sinking fund required to redeem $20,000 in thirty years.

Q. Instead of $14,000?

A. Yes, that table I am not speaking of as an error, I am
3760 simply showing what would work out at ninety points on the stock instead of ninety three. That means if the stock and bonds could only be sold for ninety without paying for brokerage charges then the investment would require 6.3 per cent—that is the company would be paying 6.3 per cent on the money it got.

Q. Instead of 6.05?

A. Yes.

Q. Turning to pages 85, 86, 87, 88, 89 and 90, you deal with certain statistics and figures under the head Massachusetts experience all of which are self explanatory are they not?

A. I think so.

Q. And pages 91, 92 and 93 carry those computations and comparisons of the Massachusetts case farther and are self explanatory are they not?

A. They are I believe.

Q. Now Professor, basing your answer and letting your judgment rest upon the experience you have had in dealing with gas cases, gas properties, and general experience that you have already related

that you have had in matters of this kind and upon an investigation and examination that you have made of the Des Moines Gas plant, the conditions in Des Moines and upon such other information and facts as you may have secured and about which you have already testified, including those that are covered in your report what in your judgment was the reasonable value of the property of the Des Moines gas company used in the business of manufacturing and distributing gas in the city of Des Moines on the 31st day of December, 1910.

Objected to for all of the reasons heretofore urged against parts of the testimony and because it does not appear that the witness is competent as an expert to answer this question.

3761 A. $1,600,000.

Q. Resting your judgment upon the same series of facts and the same experience referred to in the former question together with such information as you have secured with respect to the profits of the Des Moines Gas Co., by your independent investigations and by the statements of the officers of the Des Moines Gas Company and such of their books and records as you have been able to examine, keeping in mind the experience of gas companies somewhat similarly situated and keeping in mind also the conditions in Des Moines, the character of this property, the state of efficiency, capacity and all of the other facts and information which you have gathered for the purposes of this case, what do you have to say as to what gas can be manufactured and sold for in Des Moines per thousand cubic feet at that time.

Same objections.

A. Eighty five cents.

Q. I want, Prof. Bemis, an answer to the question limiting it to the cost of manufacture and leaving out the question of profits. What would be in your judgment the actual cost of manufacturing gas in Des Moines under the conditions that exist here and distributing it to the consumer without respect to the question of profits now?

Same objection.

A. But including depreciation allowance?

Q. Yes.

A. Sixty four cents.

Q. Now resting your answer and judgment upon the same facts and information as covered by the former question, you may state what price per thousand feet of gas manufactured and sold would in your judgment furnish a fair return upon the valuation of

3762 this property as you have fixed it.

Same objection.

A. 85 cents. I thought a moment ago you asked me the outside price.

Q. What I want in this question is the difference in cents between the cost and the fair price on the whole as you later fixed it in cents.

Same objection.

A. Twenty one cents.

Q. Now Professor, resting your judgment upon the same experience and information with respect to the property of the Des Moines Gas Company, conditions in Des Moines, population of the city, its prospective growth and all the other conditions that you have observed here with reference to gas manufacture and the facts and information that you have gathered together in your report and what you have been able to find from the books and records of the company, what in your judgment could the Des Moines Gas Company furnish gas to the consumers of this city for per thousand cubic feet and make at least a fair return upon the value of the property?

Same objection.

Q. As I understand you are asking in another form the same question of the reasonable price to give a reasonable return and is I understand it right and that be your question I should say again 85 cents.

Q. Putting that question in another way, Professor Bemis, and resting your judgment upon the same facts and same information you may state what in your judgment the Des Moines Gas Company with its present facilities and appliances will be able to furnish gas or ought to be able to furnish gas to the consumers of Des Moines during the year 1911 with a fair profit upon its investment.

3763 Same objection.

A. I should say for that year again 85 cents although the marginal profit will be a little greater than on the 1910 basis.

Q. Assuming for the purposes of this question and resting your judgment on your experience and knowledge of these matters, with $1,600,000 as the fair value of the property of the Des Moines Gas Company used in the business of manufacturing and distributing gas what return in your judgment would the Des Moines Gas Company receive based upon gas at 90 cents per thousand cubic feet, what rate of return?

Same objection.

A. Somewhat over 9 per cent.

Mr. BYERS: The defendant in connection with the testimony of the witness Professor Bemis offers in evidence defendant's Exhibit No. 43.

The exhibit is objected to as irrelevant, immaterial because predicated upon so called investment costs instead of on the value of the property, the same objection being made to each part of it; and it is also objected to as incompetent because not a statement of facts or of opinions of the witness as an expert on matters of fact, but purely an argument and this objection is made to each part of it; and it is

is also objected to as hearsay and secondary and therefore incompetent, this objection being made to each part of it.

A. I will change my last answer from over nine per cent to over eight, I have not figured it out exactly, but it is over eight and one half.

Cross-examination by N. C. GUERNSEY, Esq.:

Q. What is your present profession of business, Prof. Bemis?

3764 A. Special investigator of public utilities?

Q. When did you cease to be employed by the water department in New York.

A. October 22, I think it was 1910.

Q. And since that time you have had an office in New York as an investigator of public utilities?

A. I have not had an office in what — often known as New York, Manhattan, but at my home, where I have my home and study and my books I conduct in a way an- an office.

Q. You said you graduated from college in 1880?

A. Yes, sir.

Q. Then took four years post graduate course at Johns Hopkins?

A. Yes.

Q. And there you took up political economy and hi-tory and allied matters?

A. Yes.

Q. That would take us to 1884. You had intended then to prepare yourself for work as a teacher?

A. Yes.

Q. And after you had taken the post graduate course you went to Vande-bilt University and talked history and political economy.

A. Yes. There was a little time before I went to Vanderbilt in which I gave courses of lectures in other places. At Amherst I conducted the seniors in political economy from January until July of 1885 or 1886, I think it was 1886, and I conducted courses at Ohio University, at Vassar, Mt. Holyoke, Carlton College and Aldebert, as it was then called in Cleveland and started the University extension work, I was the first lecturer in University extension work.

Q. Then you continued teaching at Vanderbilt University until 1892?

3765 A. Yes, until that summer.

Q. Then for three years, 1892 to '95, you were assistant professor of economics and sociology in the University of Chicago?

A. Yes.

Q. Then for two years you were doing general statistical work for the state of Illinois and the United States government?

A. Yes.

Q. And for several cities. Now what was that statistical work for the cities?

A. During that time I remember having been employed at Albany for several weeks by the New York American at that time it was

called I think, possibly the New York Journal for dollar gas in New York city.

Q. My question was your employment in statistical work for several cities. What cities employed you?

A. I think that was a misstatement, at least I don't remember at the moment. I did statistical work, but just what cities—what period did that cover in my previous testimony?

Q. Then for two years, which was after 1895, I interp-lated that it was after 1895, I was doing general statistical work for the state of Illinois and the United States and for several cities. Now for what cities is my question?

A. The work at Albany in connection with New York City which was, however, not paid by the city, but work in connection with an effort at that time made for dollar gas in New York, which was then $1.25 that is the only work that I remember at the moment of that chara-ter, but I realized that that was not exactly work paid for by the city although it was altogether a case of investigation with respect to the city of New York.

Q. Then to get back to my question there was no such cities?

3766 A. I did a good deal of work in that time for Mayor Pingree in Detroit in connection with the work he was doing as Mayor.

Q. That answer- the question that far. Now then what was the character of the work which you did for Mayor Pingree, the statistical work?

A. It was not in the shape of formal reports, but I investigated for him at his request the matters of water and electric light in the city of Detroit. The city was then about to adopt the policy of municipal ownership of the electric light plant and I made some investigations for him of municipal electric light plants.

Q. Now it was this statistical work for the state of Illinois, was that this matter you refer to in connection with the street railroad and gas franchises in Chicago?

A. Yes.

Q. What statistics would you collect with reference to the street railroad franchise matter?

A. In the report that was furnished by the bureau there was if I recall right, a financial history of these companies to some extent.

Q. I don't think you caught my question. I asked you what statistics you collected with reference to the street railway franchise there if any?

A. It related to the whole situation of the street railways of Chicago.

Q. I know, but I am limiting myself to your statement you did statistical work there and I want to eliminate the work that is not statistical work and want to ask you what statistics, you in fact collected if any.

A. Statistics of the investment, operating expenses, divi-
3767 dends and profits. I have not had occasion to refer to it for many years, but I know that was the line of work and I re-

member more directly what I did on that case again for the same reason.

Q. Just wait until we get through with this please. Now then did you collect any statistics as to matters we have been referring to in connection with the street railroads, and if so, where did you get them?

A. I certainly did and wrote a report on the subject that was printed.

Q. You can write a report, but what I want to get at is just what statistics you collected with reference to these street railroads and where you got them?

A. I delved into all the old records that I got hold of in the reports of the companies to their stockholders and the data given in the financial journals, data sworn to in the New York Stock Exchange when they listed stocks and bonds, data that I could get by acquaintance with men in Chicago that knew of the financiaal history of the company. I believe I studied the taxation records and assessments and consulted real estate men, as to the true value of the lands and buildings. I consulted men like Byron J. Arnold with reference to——

Q. You don't call consulting men collecting statistics and data.

A. I asked him for some statistical data at the time and I think he gave me some, bearing on some records in his office, but I do not recall now, I have not had occasion to use it since practically and I do not recall much about it.

Q. What you did there as a matter of fact, was not collecting statistics and data, but was going over the reports of this street railroad and making an argument against the legislation it desired for its franchises?

3768 A. I attempted to do more than that. I attempted to do something a little different from that, attempted to go into the whole history and financial conditions of the company.

Q. And make an argument against the proposed legislation there.

A. I don't remember what I had in the report. I know I did make an argument against it at one time. I was at that time secretary of the Municipal Committee of the Civic Federation of which Lyman J. Gage was president and we made some reports to the Civic Federation on the subject.

Q. Was this the work you did for the state of Illinois, this street railroad and gas work in Chicago?

A. Yes.

Q. Were the books and records of the street railroad and of the gas company open to you?

A. No.

Q. So you could not get any very complete information could you?

A. No, not complete.

Q. Now then what was the statistical work which you claim to have done for the United States government during this period?

A. They printed a monograph of considerable length on the power of co-operation in the United States and its then condition.

Q. I am talking about statistical work?

A. That was full of statistics, gathered from every co-operative enterprise in the country that we could possibly get in this country for information, from co-operative creameries, building & Loan Associations and store and occasional manufacturing enterprises. Also I prepared and they printed another report on the benefit features of American trade unions, their insurance features, which was full of statistics and data that was secured from all over the United States.

3769 Q. Where did you get the statistics on these things?

A. They had never been gathered up to that time and I secured reports in writing of the secretaries of these national organizations so far as they had benefit features, some of them had quite extensive ones like the railroad brotherhoods and some did not have much of any. But what they had I got their constitutions and by-laws and the secretary's financial reports and treasurer's reports. Occasionally there were accounts of the history of these enterprises in the official organs of the National unions, the typographical union, and the German American Typographia and several other of the organizations, union machinist-, union National Cigar Makers, carpenters and joiners, National Brick Layers' Union, many of those used the benefit features and they never had been compiled before I did it, been added to since that by other investigators.

Q. That was the statistical work which you did for the United States?

A. So far as I remember it now.

Q. To go back to this work at Albany that was done for whom?

A. Mr. Hearst of New York, owner of one I think then morning paper.

Q. What you expected to do was to furnish am-unition for the newspaper campaign for dollar gas.

A. My work was principally devoted in making some investigation and giving them such information as I could on the subject in New York City as to the reasonable price for gas.

Q. Was it before a committee?

A. The joint committee of the New York State Assembly and senate appointed to take up a bill specially pending.

Q. You were employed then to make an argument before the committee in favor of dollar gas, lower gas?

3770 A. I looked into it and was convinced it was the proper thing and was in favor of it and appeared before the committee several times and argued for dollar gas which was obtained a little later.

Q. As a result of your argument?

A. Oh I don't say entirely, I think it may have had a little influence.

Q. The paper that employed you to do this work was advocating the dollar gas?

A. Yes, that paper and the New York World were advocating it.

Q. How long did you stay in Albany at that time?

A. Well I made two or three trips back and forth from Chicago.

I suppose in all I was there six weeks, but it was in between a longer period, perhaps three months.

Q. Did you make personal appeals to the different members of the committee besides making arguments before the committee?

A. No.

Q. Then you spent the six weeks in preparation for this argument?

A. Yes.

Q. And what were the statistics available at Albany for that purpose?

A. A very exhausted series of reports, on- in one volume and one in two or three volumes made in—the first in 1884 and the second in 1885 by the New York Senate and Assembly Committee in connection with the consolidation of the gas companies in New York City that had occurred in 1884. Mr. Youlden, a famous accountant at that time had written many hundred pages of this report as the result of an exhausted examination of the accounts of all companies from 1821 for the start of the first one and the engineering data of the cost of construction and of all costs, some of which had
3771 been built by Mr. Roland, who testified in regard to it. Then there had been some reports of this gas company at various times to the public or to the financial journals, there had been some evidence furnished by the companies themselves in opposing this legislation at Albany. I don't remember now fully of course all I consulted, but everything that came up before in the capitol at Albany or that year or that I could rake up in New York I tried to look through.

Q. Quitting that you continued as a teacher in Kansas?

A. Yes.

Q. Until 1899, is that right?

A. Yes, I was there two years from the summer of 1897 to the summer of 1899.

Q. And then you prepared a paper on gas works in the United States.

A. It was not confined to gas works, a book on municipal monopolies in which electric light, street railway and——

Q. I am not talking about that, I said a paper which you afterwards enlarged into a monograph on municipal gas works.

A. That was done earlier while I was in Vanderbilt, in 1901.

Q. How many municipal gas plants are there in the United States now?

A. I have not looked it up the last few years, but I think in the neighborhood of twenty.

Q. Where can we find a list of them?

A. So far as they existed at the time of the national civic federation investigation they appear in that three volume report.

Q. You don't give us the title of that?

A. No.

Q. It is hard to find it by simply calling it three volume?

A. It is. Mr. Walton Clark has a copy I am sure as he was on the commission.

3772 Q. He is not here and he may have lost it the last twenty years, I don't know.

A. This investigation is only four years old, this is the investigation of the national Civic Federation. Mr. Klumpp was employed by us in some of the work. The secretary of the National Civic Federation who can be addressed simply that way, Metropolitan Building, New York City, can probably send a copy.

Q. There is a copy in the library here isn't there?

A. I am told there is not, I have not looked it up.

Q. I thought you said in direct examination you referred to a copy you had here?

A. A copy was loaned Mr. Byers, as I understand it, by Mr. Hall because he could not find a copy in town and I had none short of New York. I think it is called the National Civic Federation Report on Municipal Utilities, but I am not quite sure. The whole set can be obtained probably if not out of print for $10.00, the first volume $1.00 in paper or $2.00 in cloth I understand the secretary sells it for that, if anybody wants to send for it.

Q. In 1892,—did you start this movement in Nashville for cheaper gas?

A. I am not quite sure I started it, I was very active in it, but whether I can be said to have started it I don't remember, I don't really know. Probably not. I think the movement was started there rather spontaneously and by the Chamber of Commerce, I think, took it up or the Merchants' Association, whatever it is called.

Q. Then the first gas case in which you were employed was in 1892 here in Des Moines?

A. Yes.

3773 Q. And at that time you had had the gas experience which you have stated?

A. Yes.

Q. You testified for the city there as an expert?

A. Yes.

Q. Much as you have here?

A. Well not as fully and I did not prepare a report course.

Q. I mean the same general plan, of course I don't mean the same facts?

A. In a measure, I don't feel that I did anything like as full gave as full or as much study to the question. I came here to the city only long enough to testify if I remember right and went away again.

Q. You testified again in the same controversy in 1894 or '5, simply giving your deposition in Chicago?

A. I think a deposition was taken in Chicago, as I recall it.

Q. Now then you continued teaching down to 1896 in the University of Chicago?

A. The summer of 1895. There was two years I did not teach.

Q. What did you do in the next two years?

A. That was when I was doing this work for the state of Illinois and some work for the United States government.

Q. Then you went to teach again and that was where?

A. That was in Kanass at the State Agricultural college, Manhattan.

Q. That was 1898?

A. Summer of 1897, to the summer of 1899.

Q. 1899 you went to Cleveland?

A. No, went to New York City. Two years I was in New York City, nearly two years not quite.

Q. It was while you were in Kansas that you wrote the book, municipal monopolies?

3774 A. Yes.

Q. Throughout all of those or both of those books you have advocated municipal ownership?

A. Yes.

Q. Your attitude has been uniformly that the public utilities were earning more than they ought to have?

A. Not in all cases.

Q. But that has been the general basis of your argument in favor of municipal ownership has it not?

A. One of my arguments has been profit to the city financially and another argument has been the civic one.

Q. Your argument in favor of municipal ownership has involved constantly for the last twenty years the claim that the public utilities were receiving more than they ought to receive?

A. More than municipalities would receive or attempt to charge if they were running the matter efficiently? I have not always claimed though that municipalities in America were efficient.

Q. Oh I don't want to go into that, that is too much of a side issue. You have uniformly contended that the public utilities were receiving greater profits than they ought to have for the transaction of business haven't you?

A. As a general proposition in a general way I would say yes, always exceptions.

Q. Of course you know a great many of them that have failed don't you?

A. Yes.

Q. And you have been advocating and making these arguments for twenty years any way?

A. I have been on the public side of all these questions,

3775 always.

Q. That don't answer my question, you have been making the arguments I refer to for twenty years?

A. I believe so.

Q. And have been very active in the matter haven't you?

A. Part of the time I have been. Not so much so the last ten years as earlier because I have felt the greatest thing now was to make a success of what cities were undertaking rather than to talk about it.

Q. There was objections while you were in the University of Chicago wasn't there on account of your so called socialistic view in these matters?

A. There was some objection to it at one time, but in connection with the Pullman strike upon the railroads, it was thought that I was not conservative enough.

Q. And your designation for these utilities, the word you have adopted, is monopolies?

A. I usually use the term municipal monopolies although I recognize public utilities is equallly appropriate, using it more of last than formerly.

Q. But it is not quite so apt to attract attention and create prejudice as the use of the word monopoly?

A. I don't think monopoly creates as much prejudice now as formerly because more and more it is recognized that these enterprises ought to be recognized as monopolies, natural monopolies.

Q. The word monopoly is obnoxious to the general people isn't it?

A. It has been and is to some extent still, depends of course on conditions.

Q. The title you adopt for your books published 20 odd years ago was municipal monopolies?

A. Yes.

3776 Q. Now you were asked in connection with this book what investigation you made with the preparation of the book and stated that you had, quoting from page 3641, data so far as I could get it upon the question of investment, operating expenses, rates, charges, franchise value stock of the municipal plants in this country. You don't mean to have us understand in the preparation of that book you either had access to or examined the operating or investment records of any large number or any large proportion of the public utilities in the United States do you?

A. I did a good deal in Massachusetts, but not much elsewhere as far as their own records, their records were sworn to and deposited at the State House in Boston for the Commission, had been at that time for a good many years, but outside of that state I had not such access to their own returns except as sometimes given in Wall Street listing the stocks or bonds.

Q. You said on your cross examination and on your direct examination that applications or lists of securities on the New York Stock Exchange we- necessarily sworn to under the rules of the Exchange. That is an error isn't it?

A. It may be an error as to their being sworn to, they are recognized in Wall Street as absolutely true, a man I think could be ruled off the Exchange who was caught making a false listing.

Q. What I wanted to get at is whether anybody swore to it or not?

A. I will have to say I don't know that an oath is taken on it.

Q. A man that made false representations in these matters would be treated just as a man who made false representations in other matters if caught?

A. I think Wall Street is more stringent in regard to stock matters than would be in ordinary business.

3777 Q. The fact is that about the only source of statistics with reference to public utilities that is or has been available to you has been these Massachusetts reports, isn't it?

A. You mean up to date?

Q. Yes.

A. Oh no not up to date. I was speaking of the time when I wrote that book.

Q. What states aside from Massachusetts have required reports from public utilities generally for more than a very few years.

A. None in this country. Of course in Great Britain I had access to their reports.

Q. I know, but that is a long way from home.

A. Yes.

Q. I don't recall your saying you were ever there more than three months?

A. I was over there on two occasions three months each and I have their reports or final compilations of them for a good many years.

Q. But all that has been until recently available for statistics has been these Massachusetts reports in the United States.

A. In every case I have been in there has been a good deal produced by the companies, the New York case for example.

Q. (Question read.) Isn't that true aside from occasional cases where there may have been a law suit or something like that? Haven't the Massachusetts reports been the only general source of information?

A. A good deal has appeared in the Progressive Age, in the Gas Light Journal, a good deal has appeared in Miscellaneous reports, occasionally, in United States Cen-us volumes, and in these later cases frequently a great mass of data was made of record in

3778 other states than the one under discussion.

Q. In the gas cases.

A. Yes.

Q. Which case do you refer to where there was such massing of data?

A. In the Consolidated gas case in New York.

Q. They massed the Massachusetts cases didn't they?

A. Emerson McMullen testified as to the experience in decreasing price of gas and the effect on the increased sale in Detroit and Milwaukee?

Q. I am talking about the statistics of gas plants where a man can go if he wants to find compilations of the statistics of gas plants in the United States.

A. You won't find anything to approach the Massachusetts data anywhere else. Of course in the last two or three years you will get a good deal in New York and Wisconsin.

Q. Coming back to the same proposition until within the last two

or three years the only place where any statistics purport to be taken or compiled was in Massachusetts?

A. Yes, I should say so, general and complete in this country.

Q. You went to Detroit in 1899 and took up street railroad franchises values?

A. Yes.

Q. That would be interesting to me, but I don't believe it would be very material in this case so I will pass it. After that you went to New York and opened this clearing house on municipal matters?

A. Yes.

Q. Particularly public utility questions?

A. Yes.

Q. That was called the Bureau of Economic Research?

3779 A. Yes.

Q. That was a municipal ownership organization wasn't it, advocated municipal ownership?

A. Not exactly that, our theory at the time was a clearing house of all lines of municipal work, cost of paving, cost of maintaining and cleaning streets, park systems, water supplies and contracts of all kinds that could be taken up and we worked together along that particular line and Prof. Commons to keep up labor conditions.

Q. Did a question like that have a bearing on the question of whether municipalities were handling the business they did do on a business basis so as to warrant the turning of more business to them?

A. It was used as to the improvement of efficiency of cities. I was very much interested at that time in the league of American municipalities.

Q. Let's stick to this concern, the bureau of research.

A. We were thinking that we could perhaps affiliate with them as a bureau of information for them.

Q. Did this bureau of economic research publish anything?

A. There were one or two monographs published by Prof. Commons on his work. I was engaged in several investigations, one for the State of Massachusetts on the lease of the Boston & Albany railroad to the New York Central and while that data was published in the Boston newspapers there was no monograph or magazine article or anything of a book or official publication of our work.

Q. How long did this bureau last?

A. Two years or nearly so, not quite.

Q. Then you went to Great Britain during this period,

3780 that is the summer of 1900.

A. Yes.

Q. Studying technical education?

A. More particularly what are known as polytechnic institutes or trade schools of Great Britain.

Q. You said on your direct examination that in connection with the work of the bureau in New York, this was this bureau of economic research, as I understand it, during the years 1900 and 1901, you were employed by the cities of Haverhill, Mass., and Springfield, Mass., in gas cases before the Massachusetts gas commission?

A. That was in connection with the work of the bureau. They corresponded with us and asked for my assistance. I don't know just what relation it had directly or officially with the bureau, except that they wrote us and wanted to know if one of us would help.

Q. And there you were endeavoring to cut down the rates of gas?

A. Well that proved to be the result of it. I was employed by the city in a hearing before the Massachusetts Commission in which the city was contending as here for a lower price and I was employed to analyze their reports to the state commission and to testify on the subject.

Q. And you did testify and testified there didn't you that the rates they were receiving were too high, that they were getting more than a fair return and that the rates ought to be reduced.

A. Yes, and the commission did so reduce.

Q. And you did the same thing in Springfield?

A. Yes.

Q. And you did the same thing in Des Moines here? Now let me ask you—let me digress for a minute. Have you ever been
3781 on the other side of this proposition?

A. No.

Q. Have you ever failed to testify in any case where you have testified that the actual operating of the company was too high?

A. I don't know that I have a remembrance of stating that their operating expenses were too high. At the same time as a general thing remarked that the price could be reduced.

Q. Can you name a single case in which you have testified where you have not said that the operating expenses were too high, the actual operating expenses?

A. I don't remember sufficiently to say as to that, as to the operating expenses.

Q. Can you give us a single case in which you have testified in which in order to reduce operating expenses you have not taken one item from one place and another item from another, putting together some low items?

A. I don't think that has been the case.

Q. Well name one of them please?

A. Well I think for example in New York City that was not done.

Q. That was not done in New York?

A. I think not.

Q. Can you name another?

A. Well I think the way it was treated in Boston and Springfield and Haverhill was the principle used previous years and with other cases. I don't think that I picked out we will say insurance from one year and taxes from another and accident claims from another or anything of that kind.

Q. Didn't do the way you are doing here, this is invented for the sole benefit of Des Moines?

A. In Cedar Rapids or in Saginaw where we had the oppor-
3782 tunity of *of* using five year periods I think that both Hall and myself criticised some increase in expense just before the litigation.

Q. Now then in 1901, you went to Cleveland at the request of Mr. Johnson?

A. Yes.

Q. And you were there how long was it, I have forgotten?

A. From about the 20th of September o4 22d, somewhere in there of 1901 until the close of 1910.

Q. Is that right?

A. No, excuse me, the close of 1909.

Q. And during that period you were in the wa-er works business?

A. I was superintendent of the city water works in Cleveland.

Q. Now then you said that you made an investigation of the street railways of Columbus?

A. That was before.

Q. That was in the spring of this same year?

A. Yes.

Q. What do you mean by investigation there?

A. All I was able to do there was to get reports of the company and data that they had filed at various times with the state as to cost of their extensions and the city engineer helped me some in regard to their street work, I got such data as I could from the company, they gave me some.

Q. You did that for a newspaper?

A. I did that for the Press Post.

Q. What was the controversy on between the city and street railway at that ime?

A. Yes.

Q. And this paper was opposed to the company?

A. It was seeking for a lower fa*ir*.

3783 Q. This paper was opposed to the company?

A. It was opposed to the franchise they were seeking.

Q. You were employed by the paper to get ammunition for it?

A. I was employed by the paper to find what I could get on the whole subject.

Q. This was one of those impartial newspapers like the Hearst papers that simply wanted the actual facts and not ammunition for its side.

A. I don't know anything about the ownership or methods, I have not ever read the paper before or since, unless passing through the city perhaps some time I might b-y an issue at Columbus.

Q. Now then you went to Cleveland to take up the city's side of the public utility controversy there?

A. Yes, in a measure.

Q. And you devoted s-veral months to that?

A. Yes, three or four.

Q. This was a street railroad and electric light controversy?

A. It was a taxation question of the proper assessment and taxation of all the public utilities of the city and also the question of steam railroads and interurban lines.

Q. Did you have access to the books and records of these companies at that time?

A. Not to any considerable extent. They brought in a great deal of data which they swore to as official from their records and the

officials of the various companies I often conferred with and they gave some information, but there was no attempt made to go into a full analysis of their books.

Q. Well you didn't have access to them did you?

A. No.

Q. Did you have access to any of their books?

3784 A. I think not.

Q. And in September 1901, you went to Cleveland and took charge of the water department there.

A. Yes.

Q. You were there until you went to New York to the water department in New York?

A. Yes.

Q. How many miles of main were there in the water department there in Cleveland when it was appraised as you stated, when you got an investment value of eleven million dollars?

A. I would say in the neighborhood of 700 miles, but I a- not sure exactly, I have never thought to look that up.

Q. What was the date of that valuation?

A. 1906.

Q. And you thin*m* then there were about 700 miles of mains?

A. My recollection is not very clear on the subject, but I think so.

Q. That would be about how much a mile?

A. Oh at that rate it would be about 15,000 dollars wouldn't it?

Q. Yes, somewhere around $15,000 a mile?

A. Of course that included the five mile tunnel out into the lake.

Q. Was this investigation made before or after that tunnel was built?

A. After.

Q. Also included the pumping station?

A. Of course, three of them. About seventy thousand services in use.

Q. What was the population then?

A. The population in the census of 1910 was about 560 odd thousand, in the previous census I think it was 382,000, growing

3785 fast in that period, I know the last census was 560,000 in the city limits. We supplied about 100,000 people in the suburbs also, 75,000 say.

Q. The work to which you devoted special attention was you said metering of the city?

A. That and the systematizing of the accounts of the department some reorganization of the business management to get as much efficiency as possible.

Q. And the metering proposition is simply a plan to measure water so that people won't waste it?

A. The primary object of that is of course to accomplish that?

Q. I think you said that in your judgment under your superintendence you brought the plant up to the standard of well managed private enterprises?

A. I believe so.

Q. Now I have gone over this somewhat in detail to get at your

experience either as an engineer or as a -ractical gas man. Now you are not an engineer are you?

A. No.

Q. You have never had any engineering experience have you?

A. No.

Q. You have never had any practical gas experience?

A. No.

Q. You never have either managed or financed or operated a gas plant?

A. No.

Q. You are not familiar with the details of the operation of a gas plant?

A. No.

Q. You could not tell us how to make gas?

3786 A. Well I didn't try to do that. Of course I know something about it and read a great deal.

Q. Oh in a general way just as we learned by these law suits.

A. Yes.

Q. That is where you have learned about making gas?

A. A good deal of reading and visiting plants. I don't claim to be a gas engineer, but I don't think it would be quite fair to say I have no engineering experience because in the supervision of the water department, I did have a certain type of experience in engineering, but not what would technically amount to technical training.

Q. You did not do the technical work?

A. Not to look into it.

Q. Certainly if I were building a house I woul- look over what the architects are doing?

A. Yes.

Q. But that would not make me an architect?

A. But the fact being that for ten years you would become something of an architect.

Q. I would learn something about it I hope. Now then you have never bought or sold gas machinery have you?

A. No.

Q. You never have as a practical proposition taken the operating cost of any plant and actually tried them out by operating the plant or watching it as it went along?

A. No.

Q. You never have had the resul-s of such work available for your information except in connection with some lawsuit where they brought in some exhibits showing operating cost?

3787 A. Oh yes; in addition to that I have had the data filed in great detail in the Massachusetts Gas Commission office and more or less I have had access to the data we got in the investigations that were given for the National Civic federation, there more particularly with regard to English plants, we went into a most complete study of engineering and construction costs on gas.

Q. Do you think that the English results would be a fair criterion to apply to Des Moines?

A. I have not tried to but I *I* think I should add in answer to your

question that the situation is not absolutely different between England and here so that the experience there is not of any help.

Q. Did you ever make an investigation of these statistics except for the purpose of sustaining some contentions in connection with a controversy over rates, the Massachusetts statistics?

A. I have in addition frequently, when I had any spare time on my hands would go into it because of a desire to get al- the data I could, keep up abreast of the times.

Q. Have you the results of these investigations compiled in any way?

A. No, but I have great quantities of notes taken on such visits that are in my home in New York.

Q. How often have you visited the office of the Massachusetts Commission in the last five years?

A. Oh I should say eight or ten times and I have employed assistance, clerical help, the secretary in the office there or his assistant and sometimes others to copy for me, complete detail returns of several of these companies.

Q. Which companies?

A. Boston and the seven referred to in this report Cam-
3788 bridge, Lawrence, Lowell, Lynn, Fall River, Springfield and Worcester.

Q. And was the Boston copy done in connection with the Boston case?

A. Since then.

Q. Recently, was done in connection with the New York case?

A. I have a lot of copy in my hoom in the hotel, the official certified copies of the last reports of four or five of these companies that were made about five or six months ago, four months ago, I was in Boston and engaged to have it done, it was done for me, I have forgotten just how long ago, but in the spring, that was the last I had done.

Q. Was the Boston record copied in connection with the New York case?

A. Yes, I introduced in the New York case a lot -f data from Boston in 1906.

Q. So as a matter of fact isn't it true that this information has been collected by you in order to support your contention that gas somewhere or other was too high, isn't that as a general proposition true?

A. I should say that fully two thirds, perhaps three fourths has been gathered in connection with cases, that a certain other proportion, quite a considerable amount has been gathered simply because it came handy to me to gather it and I wanted to get al- I could.

Q. So that as a general proposition or as a seventy five per cent correct proposition the information has been gathered in connectio- with fases where you were trying to cut down the price of gas?

A. It has been ga-hered in connection with gas cases where I have needed information.

Q. Now is there any case in which you have appeared where you have not urged a reduction in the price?

3789 A. I think not.

Q. So that my first statement was correct that three fourths

of this information has been gathered by you in connection with cases where you were seeking to bring about a reduction in the price of gas?

A. You can put the two facts together if you please, although I wanted to get the information and every time felt I thought I must have it, and it is also true three fourths of the information was gathered in connection with cases in which I was representing the city and the city was seeking a reduction of price.

Q. When were you employed in this case?

A. The correspondence requesting I come on was from Mr. Brennan some time early in the year, I don't remember what month, probably February or March and then I received a statement that the case had been indefinitely postponed owing to some change in court proceedings. Then I received another letter saying they would like to have me come on soon after the 4th of July. I could not come immediately, but I came as soon as I got through with the most important parts of the work in Chicago.

Q. Then your employment began somewhere around the middle or latter part of July?

A. Yes.

Q. Now what have you done in connection with this case?

A. I have listened to most of the testimony, taken notes on some of it, some of it I have read. I have studied a good deal the exhibits put in by the various witnesses for the company and the city, particularly Mr. Lea's, Mr. Bachr's, Mr. Hagenah's, Mr. Randolph's Prof. Marks and Mr. Hall's. They put in a good many exhibits, some of them, some of them only one or two. I tried to
3790 study them all, so far as I had time, somewhat limited time, then I studied the various matters that I refer to in my report such as these stock exchange quotations, the Massachusetts gas reports, I looked over some notes and things I had gathered previously so far as I had them in Chicago at the time I was there. I am somewhat at a disadvantage at long range from home.

Q. Is that all you have done in connection with this case?

A. Well I have testified perhaps to some things which might be considered as included, I visited the gas works one day.

Q. How much time did you spend at the gas works?

A. Well not over about an hour and a half probably. I don't remember, I didn't keep track of the time.

Q. How much time have you spent going over the city?

A. Well I have been upon probably a half dozen auto rides with Mr. Byers and Mr. Brennan, gone over a considerable of the city a little in street car rides and a little in walking.

Q. And how much time have you spent yourself on the books of the company?

A. Well that would amount of course to where I spent it in the office. I have access to no books except at their office and I did not ask for any other. I went there two or three times to ask some question of Mr. Sangster who was there and one day I stopped and looked into vouchers a little*lm* saw he was doing the work.

Q. You have not made any examination of the books, so far as you are concerned?

A. No.

Q. You have omitted one thing haven't you, during all of the examination of the experts, you sat at the table with counsel and aided in the cross examination where it was by the city?

3791 A. To some extent where I was asked to do so.

Q. I assume you did not do it in spite of them. Didn't you during the entire cross examination of Mr. Lea, the entire cross examination of Mr. Baehr and the entire cross examination of Mr. Hagenah at least sit by counsel and continually suggest questions?

A. There were some days in which I did I think, there were other days in which I did not. I think there are one or two or three days in which I was not in the city.

Q. When Mr. Hagenah went on the stand you were not in the city were you when his direct examination was commenced?

A. I think I was not.

Q. You were advised that he had been put on the stand and came here from Chicago to be here didn't you?

A. I don't think I received any message from here to come back or that he was on the stand.

Q. Are you sure about that?

A. Well I am almost positive about it. As I understand it, I left here with the request that I come back as soon as possible. I had a little work I felt I must be in Chicago and I went back and attended to it and came back again as soon as I could. That is my first visit to Chicago after I had been here. Then the second time was when there was a vacation to be taken by the court.

Q. For instance when Mr. Lea's exhibit was offered the city's copy was immediately turned over to you and you took it up and suggested the line of cross examination didn't you?

A. I fe/l that you are implying that I am responsible for more of General Byers' and Mr. Brennan's work than I am.

Q. Please answer the question, isn't what I said true?

3792 A. I occasionally made suggestions, but I should say nine tenths of all they did was entirely irrespective of anything I did.

Q. You remember sitting here a day at a time and writing questions and handing them to counsel?

A. I remember sitting here writing many days, but I was not always writing questions for counsel. I have a way of working on a case making computations while the testimony is going on.

Q. Do you usually hand that work to counsel while he was cross examining witnesses?

A. In many cases not at all, I remember some days in which I was making computations that had no connection with the witness on the stand and did not go to counsel at all and other times I did such things and handed such things at the request of counsel.

Q. Are you a member of the bar?

A. No.

Q. You have been acting as counsel in this case haven't you?

A. Well technically I don't know what you might mean by the question, if you mean as adviser I could say I have been helping as far as requested to do in a humble way although I don't claim to be a lawyer.

Q. After a month or so constantly in the performance of duties as counsel and advocate, do you find any difficulty in divesting yourself of that character and avoiding argument and so on when you get on the stand?

A. No, because in all these cases I have been doing just what I believed to be the facts in the case and I have had my convictions pretty strong all these yearsm but it does not mean the divesting of myself of these convictions in either capacity.

Q. You have had these convictions, and have argued them
3793 all these —?

A. To a large extent, they have changed and been modified somewhat by continual contact with them, but not the result of a night's thought.

Q. This Exhibit 43, was intended by you was it not to be an argument of this case in behalf of the defendant?

A. No, I did not think of it as an argument, I thought of it as my views of the case.

Q. You intended did you not to take up and discuss the testimony of the various witnesses?

A. Not in the way it would be done in a brief for the court. It was rather a summary of the evidence bearing on the views I held showing my thought on the case as the result of all testimonics and exhibits.

Q. You did not know when you were writing this Exhibit 43 that you were writing an argument?

A. Why I suppose some of it can be called argument, but it was expression of my thought and my views.

Q. Now you say in the introduction to it which is addressed to the counsel for the city as requested by you, I have studied the testimony and exhibits in this case. Now as a matter of fact that is what you have studied isn't it, the testimony and exhibits?

A. That is my chief work here, nine tenths of it. That does not mean that I have not brought out the results of previous study of course.

Q. You have not studied the property?

A. Approximately not.

Q. You have not studied the books of this company?

A. No, not directly. I have taken the exhibits and the testimony as showing what the books did contain.

3794 Q. You have taken the exhibits and testimony and you have attempted to weigh it and discussed it in this Exhibit 43 haven't you?

A. Some of the data I have got is not anything that has appeared in the case before.

Q. That is true, that don't answer my question, however. You

have taken the exhibits and testimony and you have attempted to weigh and discuss this testimony in this Exhibit 43 haven't you?

A. Partly that and partly to contribute as far as I could from my own views and thought and data so far as I have time to give it.

Q. And you have not confined yourself to an argument on questions of fact, but have also argued the questions of law?

A. To some extent.

Q. Do you still say this was not intended as an argument upon this testimony?

A. I have not thought of it as such, I had thought of it as a presentation of my views and beliefs of the case.

Q. And do you want to come here and argue these questions of law as well as these questions of fact under oath?

A. Why I consider that my studies of the decision of other cases is just as important as if I had been shoveling coal under a boiler and had gradually risen to a higher position in the work, I think——

Q. Do you think you ought to argue questions of law and questions of fact under oath?

A. I leave to the attorneys as to what questions shall be argued and I have tried to answer them, I supposed I was within my right to present this report. In almost all cases I have been cross examined, if not direct examination, along all these lines.

3795 Q. They have argued the questions of law with you while you were on the stand I suppose?

A. Yes, often. Matthewson often did it in New York.

Q. I guess it was a waste of time.

A. I don't know the supreme court decided it all right.

Q. The supreme court decided on the questions of l-w about the way you claim they ought not to be decided didn't they?

A. No, I think not.

Q. Do you concede the correctness of the supreme court's decision of the legal propositions in the Wilcox case?

A. I think there are some positions they will change later.

Q. Are you willing to concede that any of the legal propositions announced by the supreme court in the Wilcox case are correct?

A. They are binding of course, they are the supreme law of the land.

Q. I don't mean that, are you willing to concede that any of the legal propositions announced by the supreme court of the United States in the Wilcox case are correct?

A. Why of course.

Q. Now you start your argument here with the statement with the exception of half a million dollars the plant appears to have been entirely built from earnings. Give us the figures from which you deduce that statement?

A. The fact that the difference between the book investment and the outstanding bonds——

Q. What is the book investment you take for that computation. Give it to us in dollars please?

A. The book investment in the neighborhood of $1,600,000.

Q. Can you give it to us exactly, whatever you took for the basis of this statement?

3796 A. I think it is $1,667,000 on page 21.

Q. Don't you know what was the basis of this statement in your report?

A. Yes, but I was trying to find the place in my report in which I gave the investment. Investment at the end of the year, average investment given on page 24 as $1,720,000.

Q. What did you take as the basis for this conclusion which is the first sentence in your report, give us the first figure you took now?

A. That 1,727,000.

Q. Now what was the next figure?

A. The outstanding bonds $685,000.

Q. That is not the amount of outstanding bonds is it?

A. No, that was the amount in 1906.

Q. I know, but this don't say in 1906.

A. The extensions since 1906 have nominally been paid for by bonds and the earnings have been used to pay off preferred stock contracts, but that is no different in substance from taking——

Q. You are getting away from the question, what was the next figure.

A. $685,000.

Q. That was the bonds in 1906. Did you use any other figures reaching this conclusion?

A. The earnings I took of course. The earnings on page 48 after deducting depreciation was about $1,779,000. A large portion of these were represented by preferred stock contracts of $800,000 issued in 1906 and a good deal of the rest has gone into surplus since.

Q. How many of these preferred stock contracts are not outstanding?

3797 A. About half of them.

Q. What is the present surplus on the books?

A. I don't recall at the moment. There are an increased issue of bonds since then and nominally these bonds have been put into new construction, but practically you can say that the new bonds have paid for the new construction because the entire outstanding surplus is only twenty or thirty thousand dollars if I recall right, greater than that five years ago.

Q. You gave me here as cost $1,727,000, then you gave me $685,000 of bonds which is not the bonded debt at the time and the significance of which I do not just understand which you gave me as earnings net after taking out depreciation $1,779,685. Depreciation was not as a matter of fact taken out was it, that is the depreciation that you referred to?

A. No.

Q. Well how much had we ought to add to that then because that has only been taken out theoretically.

A. In case I should say that the true investment——

Q. We are not talking about that at all, talking about this first

question with the exception of half a million dollars the plant appears to have been entirely built from earnings. Now then the gross earnings would be $1,779,685 plus that depreciation that has not been taken out wouldn't it?

A. If you don't take out depreciation you have to add it to earnings on the one side and to the plant on the other so it is as broad as it is long.

Q. Don't your figure $1,727,000 represent some actual figure or is that merely a hypothetical figure which varies according to the method with which you finance depreciation.

A. That represents the profits after taking out the depreciation.

3798 Q. You have got the wrong figure, the figure just given you is the one you told me represented the investment.

A. I am looking at the sum of profits on page 48, $1,779,686.

Q. How much is that depreciation have you figured it?

A. $241,000.

Q. Will you add that for me to the $1,779,685?

A. $2,020,000.

Q. What is the amount of preferred stock contracts that have been retired out of these profits as you say?

A. It is between four hundred and 450 thousand I think.

Q. Isn't it nearer 389?

A. I will accept your figures if you say so.

Q. That is my recollection. Now deduct that will you please?

A. *One* $1,631,000.

Q. That leaves your earnings to be used in building plant don't — except a negligible item of about $12,000 that was paid out in the way of a dividend?

A. What do you say that leaves?

Q. (Question read.)

A. I don't think so. I think you ought to add the bonds to-day outstanding bonds I mean.

Q. I am not talking about bonds, I am talking about earnings. You have first the net earnings after you have taken out depreciation, $1,779,685.

A. Yes.

Q. The depreciation you charged against that was $241,000?

A. Yes.

Q. You have testified that depreciation was not as a matter of fact set aside?

A. No.

3799 Q. Well have you so testified.

A. Yes, I have testified it was no- so set aside.

Q. That would leave $2,020,685 of the total net earnings?

A. That is true.

Q. Now then you say we retired $389,000 preferred stock contracts with it?

A. Yes.

Q. That would leave available to go into plant $1,638,685.

A. Yes.

Q. Now add a half million you refer to in this sentence to that and see what you have got for the cost of your plant?

A. $2,131,685.00.

Q. You told me it cost $1,727,000, that was the total investment.

A. Yes, I gave you that figure I think.

Q. Now there is something wrong in these figures isn't there, they don't check out?

A. I didn't try to give you the exact check, but there are an excess of earnings there over the $1,727,000 and my statement——

Q. The $1,727,000 is the investment?

A. That is the investment and while technically according to your books the outstanding stock contracts are not any more — $800,000 but only $389—$800 less $389, nevertheless practically as your books show there has been an increase of only a few thousand dollars in securities in the last four or five years.

Q. You are getting clear away from this question here which is how you justify the first sentence in your report with the exception of a half million dollars the plant appears to have been entirely built from earnings. I want to know whether you can justify that with figures.

— ——.

Q. How do you do it?

3800 A. I do not make the claim there that there is only $500,000 which you are entitled to capitalize you notice.

—. ——.

Q. Please get back to the question, the question is how do you with figures justify this statement with the exception of a half million dollars the plant appears to have been entirely built from earnings or was that just thrown in there as sort of a nice thing to start with?

A. No. Now let us study these figures a moment, $2,020,685 were net earnings, $389,000 have been retired of the preferred stock.

Q. For the purpose of this discussion I am conceding it was retired out of net earnings as you claim?

A. I don't know that I recognize the reason for deducting $389,000 it would strike me at first thought that the net earnings were $2,020,000.

Q. Let me suggest this, if the $389,000 were net earnings, and was used to retire preferred stock contracts, could it also have gone into the plant?

A. No, but——

Q. Then if you say that was used to retire the preferred stock contracts, in order to conform to your theory we ought to deduct that from the total amount of net earnings?

A. I say that the books nominally seem to show that as I understand from Mr. Hall, but that is not I think substantial and practicable point. *What* the practical point is that the bonds, new bonds retired the preferred stock contracts, some of the new issue of bonds were the same day in which the preferred stock was retired.

Q. How many were?

A. I have forgotten.

Q. Don't you remember that it was just about ninety two
3801 or ninety three thousand dollars?

A. I think as far as I have any figures they are that, but I don't know what the dates are as authorized, I haven't dates as to that.

Q. You don't require $380,000 of contracts with $92,000 of bonds do you?

A. If you will notice the total outstanding preferred stock and bonds now as compared to five years ago you will find there has been less than 50,000 increase in these securities and I think that the point may be considered practically, I don't say that is on your books you did it that way.

Q. I want to know how you got this statement here. I want to get down to brass tacks and not glittering generalities?

A. First you have got to divide this into two periods, take everything before March 1, 1906, as one period and then since then as another.

Q. Why is it necessary to divide it into periods if you know the total amount of earnings in both periods. You would have to add them together then wouldn't you?

A. It is not necessary except to show the amount of my analysis there.

Q. You see you are getting away from this all the time. I want to know the basis for your first sentence in your report. If that is true it is because it is a proper deduction from some figures that have been introduced in here?

A. Yes.

Q. Now then will you give me those figures from which you made this deduction?

A. I did so in this way. I first studied the period before March
1, 1906, and found an investment value of the property as
3802 given by me on page 47 as $1,019,603. Now the bonds outstanding at that time or on the next—take out $500,000 only as my statement is half a million, leaves $519,603. Now the net income given on the same page after deducting an allowance for depreciation was $642,129.40. Therefore my thought was that the net income which had gone back largely in the plant or $542,000 had been what had been used to pay for that $519,000 of investment. Now in the same way take the second period, I can find it in a minute if you want me to take the time.

Q. I would like to have you take the time.

A. I would have to find Mr. Hall's exhibit. If you will turn to Exhibit "F" in Mr. Hall's report, defendant's Exhibit 30, you will find that the total fixed liabilities on March 1, 1906, are given as $3,734,000 and on December 31, 1910, only $3,758,000 an increase of only $24,000 and the amount of liabilities increased to the same extent which is shown a little lower down in the table, accrued liabilities increased from $21,015.83, to $58,817.07 so the total increase in liabilities was $24,000 in the fixed liabilities in the five years and about $37,700 in the current and accrued liabilities—wait a moment that was accrued liabilities I was rendering such as

interest and taxes there was in addition an increase in current liabilities from $18,227.80 to $51,836.57, increase in that item of about $33,600. The total increase was about $93,000. Now the rest of the extensions amounting to several hundred thousand dollars, about four hundred thousand dollars if I recall right, possibly 500, but anyway I think they are four, must have been paid off by surplus earnings all but $100,000 in round numbers the last five years the position I was taking in that page you refer to it was paid off
by surplus earnings while the surplus earnings before that
3803 had exceeded the construction and the $500,000 allowance.
So it was that which I had in mind when I made the statement in the table.

Q. That was the basis for this statement.

A. Yes, but I do not assume that the investment should be counted on that basis at all and do not use that as a basis of reckoning at all in future in the report.

Q. What is the significance or what is the purpose of that first sentence in your argument here?

A. It was an industrial statement as to how the property had been built which was by leaving the earnings in and then dividing them in $800,000 of preferred stock contracts afterwards and was intended to meet the statement so commonly made, I remember it — made in this case two or three times that there had been no dividends during these long periods of years, the implication being there had been no profits. It seemed to me that the profits had been made, they went into the plant, then they were taken out in preferred stock contracts, the preferred stock contracts here being paid off nominally by earnings while new bonds are ordinarily issued for extensions, but practically the securities remain the same and the extensions since 1905 was earned and a paid out of earnings much as before.

COURT: I want to call your attention to the fact that there was $400,000 of bonds of the old company at that time, that evidently was used in construction of the plant. Then there was $120,000 of this sum that was used to pay off for material evidently?

A. I think this can be said if we take the investment as I have just given it of $1,019,603 on the first day of March, and only allow $500,000 which was my statement here, there remains $519,603 and the earnings were $642,129, the earnings were $123,000 more
the than necessary to build the plant aside from the 500,000.
3804 But some of it was distributed in dividends and interest before 1895 and of course some of it since, and more bonds were issued than $500,000 and I think that statement in the spirit in which I meant it is correct.

COURT: You didn't use apt language then?

A. Perhaps not.

Q. And that was meant to answer the argument you have referred to with reference to or based upon the alleged statement that no dividends had been derived from the property?

A. That and what followed was intended to.

Q. Can you remember any one of the complainant's witnesses who testified to that or made that averment?

A. I don't remember now. I remember Mr. Lilley made it in 1895 and I thought it had been referred to in this case. I really thought there had been some reference to no dividends.

Q. You didn't intend it to answer the argument to Mr. Lilley in 1895?

A. No. I had that in mind first and I still remember some statement somebody made here.

Q. By some of the defendant's witnesses and not the complainant's witnesses.

A. May be. I thought by the company's witnesses, may be not.

Mr. Byers: Counsel himself brought it out did he not?

A. My impression is I heard it here in the court room.

Q. You next take up here do you not the cost of the property to the Des Moines Gas Company as measured by the securities which were issued for the property.

A. Yes.

Q. And you get a total of $1,440,000?

3805 A. Yes.

Q. By ignoring the common stock.

A. Yes.

Q. If you take common stock in, of course this total would not be correct?

A. That is right.

Q. Common stock was issued under the same resolution, part of the same transaction under which the others were issued?

A. Yes.

Q. Now then you say the last part of this page 6 that we are to add here some $484,467.94 for extensions since March 1, 1906?

A. Yes.

Q. Where did you get that figure?

A. I refer here to this figure Exhibit 30, page 21.

Q. Now then what is the tota- of the extensions given by Mr. Hall on page 21 from March 1, 1906 to December 31, 1910?

A. He gives the figure that I use $484,487.94, he adds then $45,000 for Valley Junction and the added cost of the holder $120,000.

Q. So that what does Mr. Hall use as the extensions from March 1, 1906, to December 31, 1910, at page 21 of his report?

A. $549,487.94.

Q. You are $165,000 less than what appears at Mr. Hull's report, page 21.

A. No.

Q. You are not?

A. No. That is in the bonds issued March 1, 1906.

Q. What you say is this if there be added the $484,000 of extensions since March 1, 1906, defendant's Exhibit 30, page 31—you say the $1,440,000 is included in the $640,000 of bonds?

3806 A. In the $1,440,000 is included the $640,000 of bonds as you will notice higher up on the page and that $640,000

of bonds includes the $240,000 issued for that holder, the $45,000 at Valley Junction is not in there, but in the city limits the property is there.

Q. The reason you did not take Mr. Hall's total was that you thought you would duplicate that holder if you did?

A. The holder was in the $640,000 and I thought to take it again would be to duplicate it.

Q. Then you do leave out the Valley Junction property?

A. Yes.

Q. You reach a figure of $1,850,000 which you call net value, line 2 of page 7. You mean cost figured on the theory which you have adopted don't you?

A. Yes, although I consider in this case on the basis I reached the previous page that the dividend and interest bearing securities issued in 1905, represented the estimate of the Des Moines Gas Company of its value because I assume that the stock had little value, but in so far as it had a value——

Complainant moves to strike out the latter part of the answer of the witness as purely an argument and statement of his conclusion as to what he believed the Des Moines Gas Company thought five years ago and as clearly incompetent.

A. You are asking whether the value as carried is correct from my point of view?

A. I was asking you whether or not this net value ought not to be net investment?

A. And I wanted to say I thought it should be value.

Q. It should be value on the supposition that the stock represented little value.

3807 A. This $1,440,000 represented value in 1906, plus something for the stock which I do not allow for.

Q. You don't know what it is?

A. No.

Q. But it did represent something didn't it?

A. Yes.

Q. So that if you get back to what you have adopted there namely what your inference is as to the idea of the Des Moines Gas Company in 1906 as to the value of its property, it would be something over $1,850,000 provided its idea of depreciation compared with yours, how much over you could not tell because you don't know what they regarded the stock was worth, that is about the straight of it.

A. Yes. I don't use that figure you notice in my further report?

Q. That is what I was going to ask you. From this time on, you do not refer to the $1,850,000?

A. No, I do not.

Q. Now you say this figure will be henceforth referred to as cost to the Des Moines Gas Company?

A. When I dictated that I thought I might be referring to it again but I didn't get around to do so.

Q. Now you say a sounder view, however, and the one more in

line with court and commission rulings, is obtained by ignoring and so on? Tell us just what ruling did you have in mind there?

A. The investment in the plant instead of what was paid on charge of ownership has been the basis of most of the rate decisions in Massachusetts and largely in Wisconsin, especially in Massachusetts and in New York. A few of these decisions have gone to the courts as in the case of the Cedar Rapids Gas Company and affirmed by the supreme court of the state.

3808 Q. Now let's get back to my question. The Cedar Rapids case you refer to is a court ruling?

A. It went to the court finally.

Q. Is that one of the court rulings you have in mind here in this part of your argument where you say it is more in line with court and commission rulings?

A. There was no change if I recall right of ownership there.

Q. You have forgotten the question I asked you, whether the Cedar Rapids Gas Company's case decided by the supreme court is one of the cases you referred to there?

A. I think I had in mind several cases where matters went up from the eastern decisions.

Q. Now then what are they?

A. The Haverhill gas case.

Q. That went to the courts?

A. And has not yet been settled.

Q. That is not authority for this statement is it?

A. The commission ruled in the way I interpret it.

Q. I am talking about courts.

A. The courts have not yet acted on that, this claim made by the company the decision of the commission should be ignored. The commission refused to recognize a transfer as an excuse for increased security.

Q. Is that undecided court case the only case you relied on?

A. No. I don't recall at the moment, but I have been familiar with a great many but just where and that the decisions were at the moment I cannot recall.

Q. Can you give us a reference to a single decision by a court or a commission, give us the reference by name that will sustain this statement in your report?

3809 A. The Haverhill case was a decision of the Massachusetts gas commission on that very point.

Q. Where was that reported and when?

A. In one of the annual reports of the commission in the early nineties.

Q. And it is still in the courts?
